A'NSGAR, or ANSCHA'RUS, styled the Apostle of the North, on account of his labours to introduce Christianity into Denmark, Sweden, and Northern Germany, was born in Picardy about the year 801 A.D. Under the patronage of Louis le Débonnaire, he went, with his colleague Audibert, to preach the doctrines of Christianity among the heathen Northmen of Schleswig, where he suffered many persecutions; but had nevertheless such success that, in 832, the pope established an archbishopric in Hamburg, and A. was appointed the first archbishop. Here he passed through many difficulties, having to save his life by flight in 845, when the Northmen and Danes under Eric I. plundered Hamburg. He afterwards made several missionary tours in Denmark and Sweden, and died February 3, 864, at Bremen, where a church was named after him. The Roman Catholic Church has canonised him.

ANSON, GEORGE, LORD, ADMIRAL, born on 23d April 1697, at Shugborough, in Staffordshire. From an early period he manifested a predilection for a sea-life. In 1716 he served as second lieutenant under Norris; next under Byng in 1718, against the Spaniards; and was made a captain in 1723. In 1739, when war with Spain broke out, he was recalled from the Carolina station, on which he had been placed since 1724, and received the command of the fleet in the South Sea, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and sailed from England in September 1740. The preparations for this cruise had been made in the most slovenly manner. Both vessels and stores were bad, and the sailors were old Chelsea pensioners; yet A., in spite of these disadvantages, achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. After his little fleet of seven vessels had been scattered by a storm, in doubling Cape Horn, he landed at Juan Fernandez, where he was soon joined by three of his ships, which arrived in a dismantled condition. While he remained on this island, he exhibited his native tenderness of character by the assiduity with which he cared for the

sick, and the pains he took to increase their comfort. Under these disadvantages, he made several prizes of Spanish vessels, and especially distinguished himself by his capture of the Spanish galleon from Acapulco, with a cargo worth £400,000. After several other bold adventures, he returned to England; and, sailing undetected through the French fleet which lay in the Channel, arrived at Spithead, June 15, 1744, having circumnavigated the globe after a cruise of three years and nine months. His perilous voyage had great importance in extending the knowledge of navigation and geography. As a reward for his services, A. was made Rear-admiral of the Blue (1744); and in 1747, after he had gained a victory over the French admiral, Jonquière, at Cape Finisterre, was made Baron of Soberton; and four years later, First Lord of the Admiralty, in which capacity he distinguished himself not less than at sea. In 1761 he was made Admiral of the Fleet. He died June 6, 1762. Few works have been so popular as Lord A.'s *Voyage Round the World*. It has numerous readers in every civilised language. It was written by Mr. B. Robins, from Lord A.'s own materials, and was carefully supervised by the latter.

ANT (*Formica*), a Linnæan genus of Hymenopterous insects, now divided into several genera, which form a family called *Formicidæ*. The English name is contracted from *Emmet*, still also occasionally used. Another old English name, not now in frequent use, is *Pismire*. The species are numerous, and are generally distributed over temperate and tropical regions. Their habits and instincts are extremely interesting, and have attracted attention from remote ages.

Ants are small insects, but of extraordinary muscular strength. They carry loads of ten or twelve times their own weight, and display great activity. They have a triangular head; the antennæ are geniculate; the jaws strong; the ligula or lower lip small, rounded, vaulted or spoon-like; the thorax compressed at the sides; the abdomen nearly oval, the pedicle which joins it to the thorax forming in some kinds a single, and in some, a double scale or knot. They live in societies, often very large, which consist, as in bees, of *males*, *females*, and *neuters*. The neuters are females with imperfect ovaries, transformed at an early stage of their existence, and are distinguished into two classes, *workers* and *soldiers*, the former constituting the greater portion

Ants.

1. Female; 2. Male; 3. Neuter (Worker).

of each society, the latter somewhat differing from them in larger size, and larger and more powerful head. The ordinary work of the society is performed by the workers: the principal part in warfare, defensive or offensive, is taken by the soldiers. The males and females constitute but a small portion of each community. They have delicate glistening wings; but the neuters have no wings, and the thorax is smaller and more compressed. The males are smaller than the females, and the workers are rather smaller than the males. The females and neuters of some kinds (genera *Ponera*, *Myrmica*, *Atta*, and *Cryptocerus*) are armed with stings; other

kinds (*Formica* and *Polyergus*) have no sting, but have the power of ejecting a peculiar volatile acid, FORMIC ACID (q. v.), from a small sac in the abdomen; by this means effectually repelling many adversaries, to which the pungent fumes are intolerable. Small animals are soon killed by the vapour of an ant-hill; and a dog has been known to retire yelling from the effect upon his eyes, either of the vapour, or of a discharge of the fluid itself. It is said, that when those ants that are unprovided with a sting make use of their mandibles to inflict a bite, they curve round their abdomen, so as to be ready immediately to squirt this acid into the wound.

The winged ants mostly appear in autumn, and perish before the commencement of the cold weather; a few surviving to found new colonies and perpetuate the race. The neuters pass the winter in large numbers in a torpid state, and resume their activity on the return of spring. The nests of ants, after midsummer, are usually found to contain winged males and females mixed with the wingless neuters, which, however, restrain them, and particularly the females, from making their escape into the air, until the pairing season, when they ascend into it in immense swarms, those from many ant-hills sometimes uniting their myriads, rising with incredible velocity in distinct columns, and soaring to a great height. 'Each column looks like a kind of slender net-work, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them.' They occasionally, however, make their appearance in such prodigious numbers, that the air is obscured by them.—The pairing of ants is supposed to take place in the air. Some of the females which escape destruction by their enemies, or by the elements, found new colonies, in which at first they perform the work usually assigned to neuters. Some, however, are seized by the neuters of ant-hills near which they fall, and there is even reason to think that these go out to search for them; they are stripped of their wings, and forcibly conducted to the habitation, the number of whose inhabitants is to be increased by their multitudinous progeny. They are fed and treated with apparent respect, like the queen-bee among bees; but a society of ants, unlike one of bees, often contains numerous females, each thus treated and equally employed in the important work of laying eggs. Unlike the queen-bees, also, they are invariably denuded of their wings; nor is this always done by the neuters, to prevent their escape, but the female ant, after fecundation, has been seen to denude herself of her own wings, as now superfluous appendages.

The eggs of ants are so small as to be scarcely visible to the naked eye. The mother drops them at random in her progress through the nest; but the workers, of whom some are always in attendance on her, immediately seize them, moisten them with their tongue, and lay them in heaps in particular apartments of the nest. They continue to watch them, and to remove them from one quarter of the nest to another, apparently in order that they may always enjoy a suitable temperature, and perhaps in order to avoid any excess of moisture. In a few days, the young larvæ are produced; and these require the unremitting care of the workers, which feed them, disgoring into their mouths, for this purpose, a viscid substance, supposed to be the ordinary food of the species, prepared for their use by a sort of half digestion. They are also extremely careful to keep the young brood clean, by constant application of their tongue and mandibles; and a great amount of labour is daily expended upon them, in conveying them from the inner apartments of the

nest towards the surface after sunrise, when the weather is fine, and back again before sunset, or when the weather becomes cold, or there is a prospect of rain. The same care is extended to the pupæ. The larvæ and pupæ are the white objects which the workers are seen hastily seizing and carrying off to places of safety, when an ant's nest is broken open; and the resemblance of which, particularly of the pupæ, to grains of barley, is supposed to have contributed to the general belief, that ants amass stores of corn for winter food. The larvæ have no organs of locomotion. The pupæ are enveloped in delicate silken cocoons, and unlike those of other insects, require assistance to extricate themselves from them when they have attained their perfect state. This assistance also is afforded by the workers.

The whole supplies of food for the inmates of the nest are brought to it by the workers. The food of some kinds is exclusively or chiefly animal, that of others, vegetable. The provisions carried to their nests by the ants of Britain and other temperate countries, are now believed not at all to be intended for winter, when the creatures are entirely torpid, but only for present use; and it appears to be certain that no kind of grain forms any part of their food. But Colonel Sykes has discovered at Poonah a species of ants (*Atta providens*), which not only store up provisions, but of which the stores consist of the seeds of a species of millet. To habits of this kind the allusions in the book of Proverbs seem to be made. Virgil also speaks of the ant providing against the poverty of old age—

Inopi metuens formica senectæ.
(Georg. i. 186.)

The ant has long been a sort of proverbial type, not only of industry, but of provident care for the future. Some ants, however, collect and carry to their nests substances which are not intended for food, but for the construction of the nest, and particularly for closing its apertures in cold or wet weather. In this way they gather together small heaps of chips of wood, bits of straw, small pebbles, &c.

The vegetable substance which ants seem chiefly to use as food is sugar, and to this, wherever it is to be found, they seem to be guided by a very acute sense of smell. *Honey-dew*, the saccharine excretion of the *Aphides* (see APHIS), is a favourite food of many species; and with this are connected some of their most extraordinary instincts; for not only do they climb the plants on which the aphides abound, that they may obtain this food, but they have been seen to wait beside them for new drops, and even to touch them with their antennæ, in order to cause the drops to flow, patting the abdomen of the aphid on each side alternately and rapidly; the ant, after the drop has been obtained, passing on to another aphid. The whole process has been likened to the milking of cattle. Even more wonderful things are asserted on this subject, as that particular ants seem to regard particular aphides as their own property, and are ready to fight in defence of their right to them—that, to secure them for themselves, they convey them from one place to another—and that the *Aphis radicum*, which derives its nutriment from the roots of grass and other plants, is actually kept in large numbers in the nest of the Yellow Ant (*Formica flava*), in order that there may be always at hand a copious supply of food, these aphides and their eggs sharing the solicitude of the ants equally with their own eggs and young. Things so wonderful are ascertained beyond dispute in regard to the instincts of ants, that even such statements as these must not be hastily rejected as incredible, and certainly they express the beliefs of careful and scientific observers.

Ants which feed upon animal food render important service in clearing away every vestige of the flesh of dead animals, and so preventing corruption; and very beautiful skeletons of small animals have been obtained by burying the animal for a short time in an ant-hill. But ants also attack living animals; insects of comparatively large size fall a prey to them, and in tropical countries, birds, reptiles, and small quadrupeds are sometimes devoured by their vast swarms, which strip the bones of the animal perfectly clean with wonderful rapidity. Domestic animals, at least when sick, are not safe from them, and man himself regards them with dread. About ninety years ago, prodigious numbers of a particular kind of ant (*F. saccharivora*) appeared in the island of Grenada. This species makes its nest under the roots of plants, and the sugar-canes were so weakened and injured in consequence, that the plantations became nearly unproductive. 'They descended from the hills like torrents, and the plantations, as well as every path and road for miles, were filled with them. Rats, mice, and reptiles of every kind became an easy prey to them; and even the birds, which they attacked whenever they lighted on the ground in search of food, were so harassed, as to be at length unable to resist them. Streams of water opposed only a temporary obstacle to their progress; the foremost rushing blindly on certain death, and fresh armies instantly following, till a bank was formed of the carcasses of those which were drowned, sufficient to dam up the waters, and allow the main body to pass over in safety below. Even fire was tried without effect. When it was lighted to arrest their route, they rushed into the blaze in such myriads as to extinguish it.' A reward of £20,000 was offered in vain for an effectual means of destroying them; but in 1780 a hurricane which tore up the canes, and exposed their habitations to a deluge of rain, freed the island from this plague.

The habitations of ants are very curiously constructed, displaying great ingenuity, although with great diversity in the different species. The greater number of species form their habitations in the ground. These rise above the surface in the form

Yellow Ants (*F. Flava*) and Nest.

of a dome; hence the name *ant-hills* commonly given them. The largest ant-hills formed by any British species are those of the large red or horse ants (*Formica rufa*), which are sometimes as big as a small haycock; but travellers in South America describe ant-hills of 15 or 20 feet in height. The nest of *F. rufa* is outwardly of rude appearance—a confused heap of such portable materials as were within reach; but within it contains numerous small apartments, of different sizes, arranged in separate stories, some deep in the earth, some above its surface, and communicating with each other by

means of galleries. Use is made of the earth excavated from below to mix with other materials in the construction of the upper parts of the fabric. Many species of ants, sometimes called Mason Ants, construct habitations by a still more elaborate masonry,

Section of Bank, shewing Nests of the Mason Ant.

making use, for this purpose, of soft clay, which they spread and mould by means of their mandibles and feet, appearing all the while to examine their work by their antennæ. The partition-walls of the galleries and apartments of the *Formica brunnea* are about half a line thick, and about half an inch high; the roofs are somewhat arched, and pillars are frequent in this marvellous architecture. M. Huber saw a working-ant of another species (*F. fusca*), without assistance, make and cover in a gallery which was two or three inches long, and of which the interior was rendered perfectly concave. There are other species, sometimes called Carpenter

Nest of Carpenter Ant.

Ants, which make their habitations in the trunks of old trees, gnawing the wood into apartments and galleries, with floors and partitions as thin as card. *Formica flava* forms its partition-walls of a sort of papier-mâché of saw-dust, earth, and spider's web. *F. smaragdina*, an East Indian species, forms its nest of a thin silk-like tissue. *F. bispinosa*, in Cayenne, makes a felt of the down which envelopes the seeds of the *Bombax Criba*. An East Indian species, *Myrmica Kirbii*, forms a globular nest of a congeries of tile-like *laminæ* of cow-dung, the interior exhibiting an assemblage of apartments and galleries. Some Australian ants form their nests of the leaves of trees glued together, after being first brought into the proper position by the united strength of multitudes.

Of the ants which form their nests in the ground, some, instead of constructing ant-hills, seek the

protection of stones, roots of trees, &c. This is the case with some of the British species, and also with the sugar ant of the West Indies, already mentioned.

Many interesting anecdotes are on record illustrative of the instincts of ants, and of the sagacity which they seem to possess. They appear also to have some power of communicating with each other, in which it has been supposed that the antennæ are chiefly employed. Some such power might be supposed to be necessary, if we could venture to reason from analogy upon such a subject, not only to their architectural and other ordinary operations, in which many must take part, systematically and conjointly, but also in their predatory and warlike excursions; for these also some of the species have. If, during the predatory excursions of the *Atta cephalotes* (a South American species), an intervening space occurs which they cannot cross, some of the creatures link themselves together—as monkeys, in like circumstances, have been known to do—forming a bridge over which the main body passes. Ants are, in general, both courageous and pugnacious. Many battles take place among them, both between individuals and large parties; and after a battle, combatants may be found locked in each other's arms, as having died together in the struggle. More extraordinary than anything of this kind, however, is the fact, sufficiently ascertained, that some species of ants go on regular forays to carry off the larvæ and pupæ of certain other species, which they carry to their own habitations to rear and employ them as slaves in the work which might be regarded as properly belonging to workers of their own race—a fact to which no other at all analogous has yet presented itself in natural history. The species known thus to make and keep slaves are *Polyergus rufescens* and *Formica sanguinea*, both sometimes called Amazon Ants. It has been noted as a curious circumstance that the kidnappers are red or pale coloured ants, and the slaves jet black. The kidnapping excursions take place only at a particular period of the year, when the nests of the black ants contain the neuter brood. The army of red ants (*P. rufescens*) marches forth, the vanguard, which consists of eight or ten only, continually changing; and on their arriving at the nest of the negro ants, a desperate conflict ensues, which ends in the defeat of the negroes; and thereupon the red ants, with their powerful mandibles, tear open the now undefended ant-hill, enter it, and emerge, carrying the pupæ in their mouths, with which they return in perfect order to their own nest. The pupæ are there treated with great care, and spend their lives among the red ants, excavating passages, collecting food, carrying larvæ, &c., as if this had been their original destination. The amazon ants are not natives of Britain, although plentiful in some parts of Europe.

Formic acid has been employed as a stimulant in gout and paralysis, and is sometimes exhibited in continental practice by means of *ant-baths*, which are prepared by boiling crushed ants, or whole ant-hills, and immersing the diseased limb in the steam.

TERMITES (q. v.), or WHITE ANTS, are very different from the true ants, and belong to the order *Neuroptera*.

ANTÆ. See PILASTER.

ANTALCIDAS, a Spartan politician, who made himself conspicuous in a very perilous crisis of the history of his nation by the skilful character of his policy. Some time after the Peloponnesian War, it seemed as if Athens were destined to regain the supremacy she had lost. The Greek states rallied

round her; while Conon, an able and vigilant Athenian admiral, and his ally, Pharnabazus, the Persian, where everywhere victorious in their naval encounters with the Spartan fleet. It became necessary, therefore, that communications should be entered into with the Persian king, from whom the confederate Greeks drew their chief resources. A. was chosen ambassador to Tiribazus, satrap of Western Asia. On hearing this, the Athenians grew alarmed, and sent Conon to frustrate the schemes of the former; but Tiribazus took A.'s part, and the result was, that Conon was thrown into prison, and A. secretly received money to enable Sparta to continue the war. At first, Artaxerxes, the Persian monarch, was dissatisfied with the conduct of his satrap, recalled him, and put Struthas, a friend of Athens, in his place; but through a complication of circumstances, which it is unnecessary to mention, A. was subsequently completely successful in securing the goodwill of Artaxerxes. He was now appointed admiral of the Spartan fleet, and assisted by Tiribazus, Ariobarzanes, &c., swept the seas until Athens became desirous of peace. For various reasons, so was Argos and Sparta herself. Tiribazus therefore assembled deputies from the Greek states, and, in the name of his master Artaxerxes, read the famous declaration or treaty of peace, to which all the members present agreed, and which is known in history under the name of 'the Peace of Antalcidas,' as being the result of the latter's able diplomacy. Its three great points were as follows: 1. That all the Greek towns on the mainland of Asia Minor, together with the islands Clazomene and Cyprus, should remain under the protection of the Persian king. 2. That all other Greek towns, large and small, should be independent; but that the islands of Lemnos, Imbros, and Seyros should belong to Athens. 3. That war should be declared against whatever state refused to accept these points. After this peace, the history of A. becomes doubtful and obscure. He seems to have lost favour with the Persians, and Plutarch even leads us to suppose that, sickened by misfortune and the loss of reputation, he voluntarily starved himself to death; but this story is not credited by scholars, both on account of its intrinsic improbability and its apparent disagreement with the statements of other writers.

ANTANANARIVO', or TANANARIVO', the capital city of Madagascar, and seat of the government. It is situated on a hill, in the midst of a mountainous region, at an elevation of 7000 feet above the level of the sea. The approach to it from Tamatave, the chief seaport, is extremely tedious and difficult, owing to the want of roads. The royal palace occupies the summit of the hill; adjoining are the dwellings of the chief officers of government; and below these, covering the slope of the hill, are the houses of the other inhabitants, constructed almost entirely of wood. The uniform shape of the houses, which are just plain huts covered with brown thatch, gives a sombre appearance to the place. A few trees, apparently a species of fig-tree, are visible here and there in the higher part of the city. The people exhibit a considerable aptitude for civilised usages; and through the agency of missionary enterprise, which has been unfortunately checked for a time by the arbitrary edicts of the reigning queen, society is considerably advanced beyond the savage state. These few particulars are gathered from the work of the Rev. William Ellis (*Three Visits to Madagascar*, 1853—4—5. London, 1858).

ANTAR or ANTA'RA, a celebrated Arab chief of the sixth century, one of the seven poets of

Arabia, whose prize-poems, embroidered in golden characters on a silken ground, were hung up on the gate of the Caaba, and thence called *Moallakat*—i. e., the Suspended. In the poem of his that has descended to our day, he paints his warlike deeds, and his love for Abia. His courage and heroism during a forty years' warfare between two Arab tribes, and his constancy in love, were long dear to the memory of his countrymen, and appear to have formed the groundwork of the voluminous romance called *Antar*, commonly ascribed to Asmai, and reduced to writing as early as the days of the Calif Haroun Alrashid, in the 8th c. This work, which has come down to us in a later and much corrupted form, gives an attractive and faithful picture of Bedouin life, and is rich in epic interest, although too monotonous to satisfy the taste of the European reader. In the East, however, it still supplies the favourite themes of the professional story-tellers who haunt the coffee-houses. A poetical translation of it into English was made by Terric Hamilton in 1820.

ANTARCTIC OCEAN, the sea round the south pole, as the *Arctic Ocean* is the sea round the north pole. It is otherwise called the Southern Ocean, comprising all the sea to the south of the Atlantic, the Indian, and the Pacific Oceans. In this view, the A. Ocean's northern limit may be conveniently divided into three straight lines—the *first* between Cape Horn in South America and Cape Agulhas in Africa; the *second*, between Cape Agulhas and the southern extremity of the Auckland Islands as an appendage of New Zealand; and the *third*, between the southern extremity of the Auckland Islands and Cape Horn. This appears to form the true boundary of the polar regions of the southern hemisphere. The most northerly isles which it encloses are New Georgia, at the mouth of the Atlantic, and Kerguelen's Land, at the mouth of the Indian Ocean. The latter tells its own story in its other title of 'The Island of Desolation;' and the former presented to Cook, even in the middle of summer, perpendicular cliffs of ice, and valleys covered with everlasting snow.

It is usual, indeed, to define the Antarctic Ocean and the corresponding ocean to the north, as being contained each within its own polar circle. But, with regard to both oceans alike, this definition appears to be inadmissible. It is only at two points—the head of the Pacific, and the head of the Atlantic—that the Arctic Sea can possibly reach the Arctic Circle at all; while, in point of fact, it overlaps it at Behring's Strait by nearly a degree, and falls several degrees short of it between the northern half of Norway and the south-east shore of Greenland. The A. O., again, is nowhere practically limited by the definition in question: not a single voyager hesitates to use the expression long before he arrives at lat. 66° 30' S.; nor yet is a single authority consistent in the use of the arbitrary nomenclature.

The A. O. has been explored, more or less satisfactorily, by various navigators, as far as 79° S. With a few exceptions, however, little of it is accurately known, the difficulties and dangers of its navigation rendering thorough and continuous investigation almost impracticable. The names that will recur in their proper places are New Georgia, Kerguelen's Land, Sandwich Land, New South Shetlands, New Orkneys, Enderby's Land, Graham's Land, Balleny, Sabrina, and Victoria Land.

Taken as a whole, these lands bear a very small proportion to the extent of an ocean which embraces half the latitudes and all the longitudes of the southern hemisphere, exceeding its kindred sea to the north, as a glance at the map will shew, by

nearly half of Asia and North America, and the whole of Europe. Such of these lands as are really accessible at all times, have been more or less valuable in connection with the whale and seal fisheries.

The features of the A. O. itself may be briefly stated to be constant fogs, baffling currents, innumerable icebergs, and magnificent manifestations of the Aurora Australis. On the coast of Victoria Land, beyond the parallel of 70°, two mountains have been observed to be of a height altogether unequalled in such a latitude—Mt. Terror, of 10,000 feet, and Mt. Erebus, of 12,400. The latter is a volcano, being, it is apprehended, the only phenomenon of the kind in either of the frigid zones.

Of the two circumpolar oceans, the southerly one has excited much less interest than the northerly. The open passages round the two capes respectively into the Indian Ocean and the Pacific, have, from the very beginning, rendered unnecessary any such voyages as those which, for nearly three centuries, have developed so much patience and fortitude in the heroic explorers of the Arctic shores.

ANT-BEAR. See ANT-EATER.

ANT-CATCHER and ANT-THRUSH, names given to birds of tropical and sub-tropical countries, which feed chiefly upon ants. They are closely allied to the Thrushes (see THRUSH), and are included with them in the family *Turdide* or *Merulide* of recent ornithologists. They are distinguished by a straight sub-cylindrical strong bill, hooked at the tip, slender legs, and very short tails. They form the genus *Myothera* of Illiger, now subdivided into several genera, one of which, *Pitta*, contains the *Brèves* of Buffon—birds of brilliant plumage, natives of the south-eastern parts of Asia and the Malayan Archipelago. The true ant-catchers are mostly American, are of comparatively sober plumage, live among the huge ant-hills, seldom fly, and are remarkable for their sonorous voices, the power of which in some species is extraordinary. The largest species, known as the *King of the Ant-catchers* (*Grallaria Rex*), is about the size of a quail. Its legs are remarkably long.

ANT-EATER (*Myrmeco phaga*), a genus of South American quadrupeds belonging to the natural order *Edentata*. The species are few. They are perfectly toothless, their food being insects, and particularly ants, which they procure in great numbers by thrusting among them a very long cylindrical tongue, covered with a viscid saliva, and then retracting it into the mouth. The head is remarkably elongated, with a slender muzzle, and a small mouth. The tongue is doubled up in the mouth when not in use for catching prey. The ears and eyes are very small. The toes differ in number in the different

Great Ant-eater (*M. jubata*).

species, but are united as far as the base of the claws, which are very large and strong, adapted to tearing up the habitations of ants. The Great A.-E. (*M. jubata*), a native of the warm parts of South America, and called in Demerara the A.-bear, is

about 4½ feet in length from the snout to the origin of the tail, which is more than 2 feet long, and is covered with very long hair. The body is also covered with long hair, particularly along the neck and back. There are four claws on each of the fore-feet, and five on the hind ones. The A.-E. spends much of its time in sleep, the long snout concealed in the fur of the breast, the hind and fore claws locked together, and the bushy tail thrown over all, as if for a shade from the sun. It is very unsocial in its habits, and is regarded as a very stupid animal. It has great strength in its fore-legs and claws, and is said to hug like the bear, so as to crush an enemy to death. The female produces one young one at a birth, and carries it about for some time on her back.—Another species, the Tamandua (*M. Tamandua*), having the same number of claws, has a less elongated snout, comparatively short hair, and a prehensile tail, is scarcely so large as a cat, and climbs trees in quest of its insect food.—The Little or Two-toed A.-E. (*M. didactyla*) differs from these species not only in the number of its toes, but in other anatomical characters.—Closely allied to this genus in structure and habits is the genus *Manis*, containing the PANGOLINS of Africa and India; but instead of hair, the body is covered with strong horny scales. See PANGOLIN.—The name A.-E. is given at the Cape of Good Hope to the *Orycteropus Capensis*, the Aard-vark or Earth-hog of the Dutch colonists, a quadruped of about the same size with the great A.-E. of America, belonging to the same natural order, and resembling it also in its elongated muzzle and extensile tongue, which it employs in the same way, but provided with grinding teeth and flat claws adapted for burrowing. It burrows with extraordinary facility, and it is in this way that it seeks to secure its safety when assailed. It has very short hair, and little of it. The ears are moderately long. It is a nocturnal animal, and very timid.—The *Echidnæ* of New Holland are sometimes called Porcupine Ant-eaters, from their food and their similarity to the true ant-eaters in their sharp muzzle and extensile tongue; but they differ much in some parts of their structure. See ECHIDNA.

ANTECEDENT, a term in Logic, Grammar, and Mathematics. Thus we call a proposition in Logic from which another is deduced, or a general principle which serves as the base and support of some particular proposition, the A. In Grammar, the A. is the word which precedes the relative—as, for example, 'The *man* who dies for his country should be held in honour.' Here 'man' is the A. In Mathematics, we speak of the A. of a ratio—i. e., the first of two terms which compose the ratio. Thus, in the ratio of 4 to 3, 4 is the A. The word is also used in the plural in a peculiar sense. 'We know very little of his *antecedents*'—i. e., of his previous character or conduct.

ANTEDILUVIAN is the word used to denote whatever existed before the Flood. The A. ages are those which elapsed before the Flood, and, in theological language, the A. religion means the religion of the patriarchs from Adam to Noah. In Geology, the 'A. period' has no reference to the deluge recorded in the Mosaic narrative, but only to the final transformation of the earth by means of water.

ANTELOPE (*Antilope*), a genus of Mammalia belonging to the order of Ruminants (q. v.), and to the hollow-horned section of that order—in which the horns consist of an elastic sheath surrounding a bony process of the skull, and are permanent, not annually renewed. The antelopes have the bony nucleus of the horns solid, not occupied, as in those of goats, sheep, and oxen, to a considerable extent,

with cells communicating with the frontal sinuses. They are also distinguished from the allied genus of goats by having the chin beardless, and from them and sheep by the horns not being longitudinally angled or ridged. The horns of antelopes are, however, very generally annulated, or surrounded with thickened rings. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the colour often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool intermixed with longer and coarser hair, particularly the CHAMOIS (q. v.) of the Alps, Caucasus, &c.; the ROCKY MOUNTAIN GOAT (q. v.) of North America; and the CHIRU (q. v.) of the Himalayas. Many species have infra-orbital sinuses or *tear-pits* (q. v.) like deer. The females of many species, as of deer, are destitute of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the Guevei or Pigmy A. of Africa (*A. pygmaea*) is only 8 to 9 inches high at the shoulders, whilst the largest species measure 5 or 6 feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by their agility and fleetness. Most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; whilst others dwell in jungles and deep forests. North America possesses two or three species, which depart considerably, as does also the chamois of Europe, from the typical character of the genus. Europe produces only the Chamois and the Saiga (*A. Saiga*), the *Colus* of Strabo, which inhabits the southern plains of Poland and Russia. Asia has a greater number of species; but they are most numerous in Africa, and particularly in South Africa. The known species amount to more than eighty, which are arranged in sections or groups according to the peculiarities of the horns and other characters, but a satisfactory classification of them is difficult. Some naturalists make a family of *Antilopeæ*, and subdivide it into genera, but they are not separated by sufficiently marked characters. The flesh of all antelopes is used as food; hence they are much objects of the chase. They furnish also great part of the subsistence of beasts of prey in Africa, where some of the species exist in such numbers that, particularly when severe drought occurs in the regions which they ordinarily inhabit, dense and multitudinous herds occasionally appear in the interior of Cape Colony, to the terrible devastation of the crops. Even the saigas of the Tartarian plains congregate in herds of many thousands in the end of autumn.

The name A. is sometimes more particularly restricted to a species also known as the Common or Indian A., and as the Sasin. It is a native of India and the eastern parts of Asia, and is a beautiful animal, about 2½ feet high at the shoulder, with erect, diverging horns, bent in a spiral of two or three turns. The hair is uniformly short, except that, as in many other species of A., there are small tufts of bristles on the knees. It inhabits open plains, and the herds exercise great watchfulness. Its fleetness is such that greyhounds chase it in vain; and it can easily bound over an enclosure of 11 feet in height, or over a distance of 10 or 12 yards. The flesh is held in small esteem, and the animal is less than many of its congenerers an object of the chase.—The Saiga is a much less graceful animal; its horns are short, and, as in many of this genus, curved first outwards and then inwards, so that the whole outline formed by them resembles that of a lyre. They are used by the Russians and Chinese for the manufacture of many articles of domestic economy; and it is chiefly for their sake and that

of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes.—The Dzeren (*A. gutturosa*), sometimes called the Chinese A., and known among the Chinese by a name which signifies the Yellow Goat, is an inhabitant of the arid deserts of Central Asia, the flesh of which is highly esteemed, and which is therefore a chief object of the chase in these regions. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by a dilatation of the larynx.—The Addax, or Nubian A. (*A. Addax*), which was known to the ancients, and is

Addax (*A. Addax*.)

mentioned by Pliny, has horns very similar to those of the Indian A., but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of Central Africa, and contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The Chikara and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The chikara inhabits thick forests and jungles. Like the addax, it lives in pairs; as do also the Stein-boc (q. v.) of South Africa, an extremely graceful species; and the Kleene-boc of the same country (*A. perpusilla*), a beautiful and active little creature, with very small horns. The kleene-boc is of a mild and gentle disposition, and extremely capable of domestication. The Gazelle (q. v.) of North Africa (*A. Dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favourite objects of comparison. The South African SPRING-BOC (q. v.) is another very beautiful species, and is frequently domesticated by the colonists at the Cape of Good Hope. Among the numerous species which that country produces may be mentioned also the Blauw-boc (*A. leucopheus*); the Riet-boc (*A. arundinaceus*); and the Caffrarian ORYX (q. v.), (*A. Oryx*), which somewhat resembles, but is quite distinct from, the Oryx of the ancients (*A. Leucoryx* or *A. Gazella*), also called the Algzal, a native of the countries on both sides of the Red Sea. Still more worthy of notice among the South African species, but in some measure departing from the strict A. type, is the ELAND (q. v.), the largest of all the antelopes—an animal which may yet prob-

Head of Antelope Chikara.

ably be found very valuable in domestication. The Kudu (q. v.) is another noble species, allied to the eland. The NYL-GHAU (q. v.) of India, and the GNU (q. v.) of South Africa, are also among the largest antelopes, but depart still further from the generic type, particularly the latter, so that a separate genus (*Catoblepas*) has been constituted for it, having better claims to be recognised than the other genera into which it has been proposed that the antelopes should be divided. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the BUBALUS (q. v.) of the ancients, a native of the north of Africa, the Arabic name of which signifies wild ox, and the KAAMA (q. v.) or Harte-beest of the Cape of Good Hope, which is nearly allied to it. The PRONG-HORN (q. v.) and the ROCKY MOUNTAIN GOAT (q. v.) are the best known North American species; and both are found only in the western parts of the continent. It has been proposed to introduce the latter, as a wool-bearing animal, into the Highlands of Scotland.

ANTENNÆ, in Zoology, jointed filaments with which the heads of Insects, Crustacea, and Myriapoda are furnished, and which are evidently very delicate organs of touch. They are therefore sometimes called feelers. The name A. is derived from *ante*, before. The A. are placed on the anterior or superior part of the head; the animals appear to feel their way with them, and to them is ascribed the bee's power of working in the dark. Some suppose that they are also organs of hearing, and by means of them it would appear that many insects, as bees and ants, have the power of communicating with one another. They possess great flexibility, but differ very much in the number of joints which they contain (amounting sometimes even to 100), in the relative length and thickness of their joints, and also in their form, being filiform or thread-like, clavate or club-shaped, feathered, &c., in endless variety.

ANTEQUERA (the *Anticaria* of the Romans), an important town in the province of Andalucía, Spain, is situated in a fertile plain, 45 miles west of Granada. Pop. 17,000. The inhabitants are engaged chiefly in agricultural operations, but also manufacture baize, silk, cotton, and paper. They are noted for their love of bright colours in dress. Although A. is clean and well built, it is rarely visited by travellers, on account of its lying considerably off the high road. As late as 1544, the place possessed, in almost perfect condition, an ancient palace and theatre; but about that time the stones were plundered to build a convent, and only a few were spared, which are now imbedded in the walls of the town. A., like all the other cities of South Spain, was for a while in the hands of the Moors; but in 1410 it was retaken by the Regent Fernando, who is hence called *El Infante de A.* When the French took the place, during the Peninsular War, they converted a curious old mosque—a relic of Moorish sway—into a storehouse, and on their departure carried off with them the magnificent Moorish armoury.

ANTHELIA (Gr. *anti*, opposite, and *helios*, the sun; Ger. *Gegensonnen*) are luminous rings, seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a centre. When the sun shines brightly, and the fog is dense, as many as

four concentric rings of this nature are seen by the observer round the shadow of his head, having their common centre in the point where a line from the sun through the eye of the observer meets the fog. When the phenomenon assumes this form, the rings are more or less coloured—the colours of the two inner rings being generally brilliant, those of the third more faint, while those of the fourth are scarcely perceptible. This last has an angular radius of about 40°, and is very seldom seen. It bears frequently the name of the Circle of Ulloa or the White Rainbow. A phenomenon substantially similar to the A. occurs when, the sun being near the horizon, the observer sees an aureola surrounding the shadow of his head cast upon grass or corn moistened with dew. The occurrence of A. is generally attributed to the diffraction (q. v.) of light.

ANTHEM (Gr. *anti*, against, *hymnos*, a hymn; a hymn sung in alternate parts), a species of musical composition introduced into the service of the English Church after the Reformation, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the A. are taken from the Psalms, or other suitable parts of the Scriptures, and the music is either for solo, soli, or chorus, or a mixture of all three. As a specimen of English music, it can only be heard to perfection in cathedral service. In its origin, musical construction, and use, it is similar to the motet of the Romish Church, which name has been retained by the Lutheran Church. See MOTET; also ANTIPHONY.

ANTHEMIS. See CHAMOMILE.

ANTHER. See STAMEN.

ANTHERIDIUM, the name given by some botanists to an organ in cryptogamous plants which they suppose to be analogous in its functions to the stamen or male organ of fructification in phanerogamous plants. Antheridia are variously situated on the surface of plants or within their tissue. Sometimes they are simple cells; sometimes they are composed of a number of cells, containing a mucilaginous fluid, and peculiar small bodies called *Phytzoa* (q. v.), which at a certain period exhibit active movements like those of animalcules. The antheridia finally discharge their contents through an opening; and it is supposed by some that their contact with another class of organs, to which the name PISTILLIDIUM (q. v.) has been given, is essential to the production of spores, the seeds of cryptogamous plants. But these names are to be regarded as at best only provisional, and these views as far from being sufficiently established.

ANTHOLOGY (Gr. flower-collection) is the title usually given to a book consisting of an unconnected series of choice thoughts, whether in prose or verse, but generally in the latter. Of the collections of this kind made in ancient times, which consisted mostly of epigrammatic poems, the best known are the

Greek Anthologies.—The first Greek A. was compiled by Meleager of Gadara, in Syria, about 60 B.C. Besides this, there were three or four others belonging to periods considerably subsequent to the birth of Christ; but all these earlier anthologies are lost. What we now possess are two later collections, one by Constantine Cephalas in the 10th c., who borrowed largely from one of the earlier anthologies; and another by Maximus Planudes, a monk of Constantinople in the 14th c., who, by his tasteless selection from the A. of Cephalas, rather spoiled than increased the already existing store. The A. of Planudes was first issued in print at Florence in 1494 by a learned Greek, John Lascaris, and for a long time was the only one known. It went through successive editions, and received various improvements. The latest edition (with the Latin version of

Grotius, a master-piece of latinity and rapid execution) was commenced by Bosch in 1795, and finished by Lennep in 1822. Meanwhile, Claude Salmassius had discovered in the Heidelberg Library (1606) the only extant manuscript of the older and richer A. of Constantine Cephala, which he compared with that of Planudes, copying out the poems not found in the latter. During the Thirty Years' War, the Heidelberg manuscript was carried to Rome; but in 1797, after the peace of Tolentino, the French contrived to secure possession of it, and brought it to Paris. In 1816 it was returned to Heidelberg. After the important discovery of Salmassius, the work was often mentioned by the name of the Palatinate Manuscript, or the Vaticano-Palatinate. Portions of it were published by Jensus, Leich, Reiske, and Klotz. The entire collection, augmented by fragments of the older poets, and by epigrams found on monuments and in other works, was edited by Brunk at Strasburg in 1776, under the title *Analecta Veterum Poëtarum Græcorum* (Selections from the Old Greek Poets), and later by Jacob, under the title of *Anthologia Græca, sive Poëtarum Græcorum Lusæ ex Recensione Brunkii* (Greek A., or Fugitive Pieces of the Greek Poets, from the corrected Text of Brunk), 1794—1814, at Leipsic. Since then, it has been published variously, in whole or part. It is impossible not to admire these gems. Nowhere is there to be found a richer variety of poetic life, greater delicacy of sentiment, a more joyous serenity, a greater abundance of wise, true, humane thoughts, than sparkle in the pages of the Greek A. To the poet, it presents the most graceful images and the most exquisite conceptions; to the philosopher, maxims adorned with all the graces of style; to the historian, monumental inscriptions; to the philologist, the most varied forms of an imperishable language; to all, a charming revelation of antiquity.

Latin Anthologies.—In 1573, Scaliger published at Leyden, in imitation of the Greek A., a Latin A., under the title *Catalecta Veterum Poëtarum* (Gatherings from the Old Poets), and Pitthöus one at Paris, 1590. A larger collection was issued at Amsterdam (1759 and 1773) by Peter Burmann the Younger, under the title *Anthologia Veterum Latinorum Epigrammatum et Poëmatum* (A. of Old Latin Epigrams and Poems), a more correct and better arranged edition of which was published by Meyer in 1835.

Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of 'beauties' of their best poets, with biographical notices, which are either placed in chronological order, or according to the countries in which the authors lived.

1. *Arabic Anthologies.*—Abu-Temam published selections from the old Arabic songs previous to the time of Mohammed, arranged them in ten books, and named the entire collection after the first book, which consisted of war-songs, *Hamāsa*. Another famous A. is the *Divan* of the Hudhalites (an Arabic tribe), an edition of which was published by Kosegarten. Abu'l-Faraj of Ispahan (died 966) gathered together in his *Kitāb al-aghāni* (Book of Songs), all the ancient Arabic songs down to the first centuries of the Califate. It was published by Kosegarten in 1840. Abu'l-Faraj accompanied the work with a minute commentary, which makes it one of the most interesting of the old Arabic literature. But the richest and most complete A. of the later Arabic poetry is *Yatimat al-dahr* (the Pearl of the World), by Taalebi, in which the writers are arranged according to the provinces in which they lived. It has been continued and enlarged since the period of

the original compiler. Besides these and similar national anthologies, collections have been made in almost every province where the Arabic culture and speech prevailed. Such, for example, are the numerous Arabico-Spanish ones, though these are but little known.

2. *Persian Anthologies.*—In the Persian literature, the best known works of this sort are *Taskarat al Shu'ara* (Lives of the Poets), by Daulat Shah (died 1495), the contents of which are to be found almost entire in Hammer's work on Persian *belles-lettres* (Vienna, 1818), and *Atesh Kedah* (the Fire Temple), by Haje-Lutf-Ali-Beg, who lived about 1770. Both works give biographical notices of the Persian poets: the first, in chronological order; the second, in topographical order, with specimens from their works. An A. of the best Persian poetry, arranged according to the subjects, is given in the *Medshua al Shu'ara* (a Collection of Poets).

3. *Tatar Anthologies.*—Of the poets who have written in the Tatar—i. e., the East Turkish or Tshagatai dialect—we possess a collection comprising 441 biographies, with specimens of their poetry: *Madshalis alnasais* (Charming Company), by Mir-Alischir (died 1500), and the *Lives of the Tatar Poets*, by Sadiki, extending down to the 17th c.

4. *Turkish Anthologies.*—The number of anthologies in the West Turkish, or, as it is generally called, the Turkish language, is very numerous. The most famous are—*Hesht Behesht* (the Eight Paradises), by Sehi of Adrianople (died 1548); *Taskarat al Shu'ara* (Lives of the Poets), by Latifi (died 1582), and, under the same title, a similar work of Ashik-Tshelebi (died 1571); and the great collection, *Subdat al-ashaar* (the Blossoms of Poetry), by Kassa: (died 1621). The substance of these anthologies is to be found in Hammer's *History of West Turkish Poetry* (Pesth, 1836).

5. *Indian Anthologies.*—The literature of the Mohammedan population of Hindustan, which is a mere copy of Persian literature, has also several anthologies. The most important are—*Gulzari Ibrahim*, by Ali Ibrahim, containing biographical notices of 300 Hindustani poets, with specimens of their writings; the collection called *Divani Iihan*, by Beni Narayan; *Guldastai Nishât* (Garland of Pleasure), by Manu Lal (Calcutta, 1836); and *Guldastai Nâzninân*, by Kerim-ed-din (Calcutta, 1845). The substance of these works is to be found in Garcin de Tassy's *Histoire de la Littérature Hindoue e. Hindoustani* (Paris, 1839—1847), which, under the title of *Tabakâtî Shu'arâi Hindi*, was translated into Hindustani by Kerim-ed-din (Delhi, 1848). In the pure Hindi, we have a rich collection of songs, the *Râg d Sâgar*, by Krishnânanda (Calcutta, 1845).

6. *Sanscrit Anthologies.*—The Sanscrit literature is not so rich in anthologies as the other oriental literatures. If we do not consider the Vedic hymns, and the collections of poems which bear the general title *Sataka* (a Century), anthological in the proper sense, there is only one work of this kind known—viz, the *Paddhati*, by Sarngadhara, towards the close of the 14th c., in which are gathered together 6000 detached strophes of the most famous epic, lyric, and dramatic poets of India, arranged under certain heads.

7. *Chinese Anthologies.*—From the earliest ages, the Chinese had the custom of sending, along with the yearly tribute to the emperor, copies of such songs as had acquired popularity. Confucius selected from a great number of these 311 of the most beautiful. These are preserved under the name *Shi-king* (Book of Songs), one of the canonical books of the Chinese. This is the oldest A. in the world. A Latin version, by Lacharme, was published at Stuttgart, 1830; a German one, by Rückert, at Altona, 1833. Besides

this, there is *Tchao-ming-wen-siouen*, a collection of the finest poems of the time of the Liang dynasty (502—556 A.D.), and also *Thang-shi*, poems of the time of the Thang dynasty (618—914 A.D.).

ANTHON, CHARLES, LL.D., a well-known editor of classics, was born in the city of New York in 1797. At the age of 14, he entered Columbia College, where he pursued his studies with ardour and success for four years. Having been originally intended for the law, he now passed through a preliminary practical instruction in his brother's office, and in 1819 was admitted to the bar of the supreme court of the state of New York. His time, however, was chiefly devoted to classical literature, for which he soon began to acquire a high reputation; and in 1820, when only 23 years of age, he was appointed adjunct-professor of Languages in Columbia College, which office he held for fifteen years. He now commenced that series of classical publications which has done so much to make available for popular purposes the erudite researches of European scholars. His first work was a new edition of Lempriere's *Classical Dictionary*, which was almost immediately re-issued in England. In 1830 appeared his larger edition of Horace, quite a novelty in its way, on account of the superabundant English notes which accompanied the text. In 1833, he issued a smaller edition, for the use of schools and colleges. Virgil, Cæsar, and other ancient writers have been illustrated in the same attractive manner. A.'s editions of the classics have acquired an extensive popularity; but scholars are disposed to regard them with a kind of learned aversion, both because of the temptations they present to the school-boy to overlook the difficulties of a knotty passage, and of the superfluous and often unimportant matter which is dignified with the title of 'commentary' or 'notes.' It cannot be doubted, however, that these works have given a healthy stimulus to the rudimentary study of the ancient authors. In 1831, A. received the degree of LL.D. from his Alma Mater, and in 1835 he was appointed professor of languages in the same institution. A. published many works on ancient geography, Greek and Roman antiquities, mythology, literature, &c. He died July 29, 1867.

ANTHONY, ST. See ANTONY, ST.

ANTHOXANTHIUM. See VERNAL GRASS.

ANTHRACITE (Gr. *anthrax*, a coal), a mineral substance of the nature of coal, but consisting of carbon with a minimum amount of hydrogen. It is of a black colour, conchoidal fracture, and imperfectly metallic lustre (hence called *glance-coal*). It burns slowly and without flame, and hence is sometimes called *blind-coal*. Its vegetable origin cannot be doubted. Where strata of common coal have been broken through by trap dikes, the coal next the trap is found to be A., with a gradual transition into the ordinary state; hence geologists look upon A. as natural coke (q. v.), formed by heat or other process from ordinary coal. A. is used as fuel like coke. It is applied in many places to the burning of lime and bricks, the reduction of iron, &c. It occurs extensively in Ireland, and in some of the coal-fields of England, Scotland, and the continent of Europe; but on the largest scale in Pennsylvania, U. S.

ANTHROPO'LATRY (Gr.), a term signifying, according to its derivation, the worship of man, and always employed in reproach. Thus, the early Christians accused the heathens of A., because, in their mythology, men were represented as exalted among the gods, although an *apotheosis* (q. v.) was in these cases alleged by their worshippers; and the heathens retorted the charge because of the worship of Christ; the reply to which was the assertion of his divinity. But the term is chiefly known in

ecclesiastical history in connection with the employment of it by the Apollinarians (q. v.) against the orthodox Christians of the 4th and 5th centuries, with reference to the doctrine of the perfect human nature of Christ.

ANTHROPO'LOGY (from the Gr. *anthropos*, man), a term signifying, according to its derivation, that branch of science which has man for its subject. In its proper sense, it is very comprehensive, and of course includes Anatomy, Physiology, Psychology, Ethnology, and even History in the largest sense of the term, with much of Theology, Æsthetics, &c. It is not in common use, and when it is used, is often limited to the subject of the relations between mind and matter, or soul and body, in man.

ANTHROPOMORPHISM (from the Gr. *anthrōpos*, man, and *morphē*, a form), the application, in a figurative way, to God, of terms which properly relate to human beings. Thus, in the Holy Scriptures, we read of the eye, the ear, the arm, the hand of God; and of his remembering, forgetting, &c. This A. appears to arise of necessity from our incapacity of forming conceptions of things spiritual, or finding any terms in which to express them, except by analogies derived from things cognizable by our senses, so that even the language of adoration is borrowed from the familiar things of this world. It must be evident, however, that A. employed in an unguarded manner, or too grossly understood, might lead to most serious error; and a tendency has manifested itself at various times in the history of the Christian Church, to ascribe to the Divine Being a form and parts like those of men. Thus, the Audeans (q. v.) or Audians, a Syrian monastic sect which sprang up in the 4th c., were accused, and, it would seem, justly, of holding that God was possessed of a human shape, and that, when the Bible said that 'God created man in his own image,' the words are to be understood of this shape literally. The same error was at a later period ascribed to the Waldenses, but there is no evidence of the justice of the accusation. A tendency to A. may indeed be regarded as always existing, and so requiring to be guarded against in the mind of every man; but the instances have been rare and isolated, although they have from time to time occurred, in which anthropomorphic views have been fully adopted and openly expressed among Christians. The error of the anthropomorphites has, however, found countenance from the speculations of philosophers. Hobbes, Forster, and Priestley ascribed to the Divine Being a sort of subtle body. Fichte, on the other hand, rejected the very doctrine of the personality of the Divine Being as anthropomorphic, and represented God as the *moral order of the universe*; and Schelling, Hegel, Feuerbach, and Schleiermacher substituted for the objective personality of God a subjective consciousness of God in the human soul.—The term *Anthropopathism* is sometimes employed to denote the ascription to God of human affections and passions, although A., in its most general sense, includes this. The language of Scripture, in the many instances of this kind, must be interpreted according to the same general principles which are applicable in those of A. strictly so called, with the same discrimination of the figurative from the literal, and the same constant recognition of the absolute spirituality and unchangeableness of God; yet so that important truths conveyed by means of such language, and which it is probable could only be conveyed to us by such language, in accordance with our mental constitution, may not be rejected or obscured. And here, it must be confessed, there is greater difficulty than with regard to A. strictly so called.

ANTHROPO'PHAGI. See CANNIBALS.

ANTHUS and ANTHIDÆ. See PIPIT.

ANTHYLLIS. See KIDNEY VETCH.

ANTIARIS and ANTJAR. See UPAS.

ANTIBES (anciently *Antipolis*), a fortified seaport in the department of the Var, in the S. E. of Provence, France, lat. 43° 34' N., long. 7° 8' E. Pop. 6200. It lies on the east side of a small neck of land called La-Garoupe, not far from the frontier of Sardinia, in a very fertile district, producing wine and fruits. The harbour is only serviceable, however, for small craft. It is a military station of the third rank, possesses a naval school, and has considerable trade in olives, dried fruits, salt-fish, oil, &c. The anchovies prepared at A. are held in high estimation. The environs of the town are beautifully adorned with gardens, vineyards, and orchards.

A. is a very old place, having been founded by a colony of Greeks from Massilia (Marseille), of which it was a dependency. In the time of Augustus it was elevated to the rank of an Italian city, and must have attained a high degree of prosperity, if we are to judge from the ruins that still exist. After the wreck of the old Roman empire, A. suffered the fate of all classic cities in that region, becoming subject to successive tribes of barbarians from the north. In the 9th c., it was destroyed by the Saracens; in the 16th c., it was fortified by Francis I. and Henry IV.; during the Austrian War of Succession, it sustained a siege of three months (1746); and in recent times, gained some notoriety from having closed its gates against Napoleon, on his return from Elba.

ANTICHLORÉ is the name given to commercial sulphite of soda by paper-makers. When the rags are reduced to a pulp, they are bleached by chloride of lime (bleaching-powder), which thoroughly soaks the pulp, and is very difficult to wash out. The traces of chlorine thus left in the pulp pass into the manufactured paper, and tend to bleach the writing-ink which may be traced thereon. To free the pulp from the residue of the chlorine, some sulphite of soda is employed, and hence the name A., which literally signifies 'against (*anti*) chlorine.'

ANTICHRIST (from Gr. *anti*, against, and *Christos*, Christ). The general notion of A., as a power opposing itself to the reign of the Messiah, may be traced back beyond the Christian era. Its origin is perhaps to be found in the prophecy of Ezekiel concerning the doom of Gog and Magog. In accordance with the old saying, 'When need is sorest, help is nearest,' the Jews conceived that, immediately previous to the Messiah's reign, national adversity must be experienced in an extreme degree, and that an agent of Satan would appear, who must be overcome before prosperity could be restored. This was A. The idea is adopted in the New Testament, although the term A. occurs in no place of Scripture, except in the First and Second Epistles of John. From such passages as the prophecies of the Saviour, Matt. xxiv. and Mark xiii., it has been inferred by some that probably the great truth which this conception was intended to shadow forth was similar to that illustrated in the life of 'the Man of Sorrows'—that only through tribulation and strife could the reign of the Messiah be established, that Christ's kingdom, like Christ himself, could be made perfect only through suffering. And with this the language of John in his epistles, and of Paul in passages which seem to embody the same idea, is supposed to accord. Nor is it regarded as a fatal objection to this opinion, that in the Apocalypse the Antichristian power or element is associated with the great heathen capital Rome, symbolically designated Babylon.

But this opinion neither has been nor is generally

prevalent. The idea of A. early became associated with that of the Millennium (q. v.), retaining a form very similar to that which it had among the Jews before the advent of the Messiah; and popular opinion has always sought to find for it some actual and definite embodiment. In the 5th c., a popular delusion prevailed, founded on the passage in the Apocalypse, xvii. 8, that Nero was not dead, and would return in the character of A. Since the 16th c., the prevalent opinion among Protestants has been that A. is the Roman Catholic Church; an idea entertained even at an earlier period, as, for instance, by Ludwig of Bavaria, regarding Pope John XXII., by Occam, Wickliffe and his pupil Cobham, and the Bohemian reformer Janow, and which seems to have prevailed to a considerable extent among the Hussites and other opponents of Rome. This opinion has of course been strenuously opposed by Roman Catholic writers, as by Bossuet, who, in his comments on the Apocalypse, ably advocates the opinion that Pagan Rome was A. The opinions of Roman Catholics, however, are much divided upon this subject, many of them maintaining that A. is yet to come and 'to raise the last persecution,' as 'no one has yet appeared to whom we can apply the character which the infallible Word of God declares shall be that of the real A.'—*Keenan's Catechism of the Christian Religion*.

The opinion prevalent among Protestants depends upon the identification of A. with the mystical Babylon of Apocalypse, and with other symbolic representations in that book, of a power opposed to the cause of Christ, and also with the 'Wicked' one, the 'Man of Sin,' and 'Son of Perdition,' in 2d Thess. ii. Thus it is maintained that a definite embodiment of the idea of A. is to be sought in history, and that this is to be found in the Church of Rome or in the Papal power. And Protestants refer to the gradual growth and development of the errors which they regard as culminating in the Church of Rome, as accordant with the declaration of Paul in 2d Thess. ii., that 'the mystery of iniquity doth already work,' and with that of John, 'even now are there many antichrists.'

There have been, however, among Protestants eminent opponents of this opinion, among whom may be named Grotius. His own opinion was singular, that Caligula, the Roman emperor, was A. In the Greek Church, the term A. has been understood as especially applicable to Mohammed, or to the dominion of the Turks and Saracens. Almost every great or striking event—the arrival of the year 1000; the beginning of the Crusades; the 'black death' and other plagues in the 14th c.; the career of Napoleon in 1805; and even the political movements of 1848 and 1849—has suggested new interpretations of the passages of Scripture regarding A. See REVELATION, BOOK OF.

ANTI-CORN-LAW LEAGUE, the name adopted by an association which concentrated the efforts of the free-trade party in Britain, and enabled them to carry the repeal of the corn-laws, and establish in practice the principle of free-trade. The results thus accomplished will have to be considered under other heads, as CORN-LAWS, FREE-TRADE, &c. This statement is limited to a brief account of the League itself, and its method of working. Associations to obtain the repeal of the corn-laws existed in several places before the embodiment of the League—one especially was founded in London in 1834. In 1838, Mr. Cobden and others took the opportunity of the periodical assemblages of the Manchester Chamber of Commerce for exposing the deleterious influence of the restrictive commercial policy on the manufactures and trade of the country. The friends of free-trade, at the same time, occasionally met in

Manchester to discuss and promulgate their views; but it was in the beginning of 1839 that the strength of the party was first drawn to a focus, by the appointment of delegates from the manufacturing districts to proceed to London, and press their principles on the legislature. Mr. Charles Villiers, now (1859) President of the Board of Trade, undertook the leadership of their cause in the House of Commons, of which Mr. Cobden, who subsequently served it so effectively, was not then a member. On the 19th of February, Mr. Villiers moved that the House resolve itself into a committee of inquiry on the corn-laws; and again, on the 12th of March, he moved that certain manufacturers be heard by council at the bar of the House against the corn-laws, as injurious to their private interest. The former motion was rejected by 342 to 195; the latter, by 361 to 172. Immediately on the return of the delegates from their unsuccessful effort, the League was formed. Its constitution dates from the 20th March 1839, when resolutions were adopted, at a meeting in Manchester, for 'the formation of a permanent union, to be called "The Anti-corn-law League," composed of all the towns and districts represented in the delegation, and as many others as might be induced to form anti-corn-law associations, and to join the League.'

'Delegates from the different local associations to meet for business from time to time at the principal towns represented.

'With the view to secure unity of action, the central office of the League shall be established in Manchester, to which body shall be intrusted, among other duties, those of engaging and recommending competent lecturers, the obtaining the co-operation of the public press, and the establishing and conducting of a stamped circular, for the purpose of keeping a constant correspondence with the local associations.'

It was resolved that, in addition to the funds which local associations might provide for their own district purposes, £5000 should be put at the disposal of the central body, and that every person, or collection of persons, contributing £50, should have one vote in its deliberations. The League collected and distributed large sums of money. Just before its principles became triumphant in the free-trade legislation of 1846, it demanded a quarter of a million, which would have been supplied had it been necessary.

It is of the greatest moment that the cause of the success of the League should not be misunderstood: it triumphed not by possessing money, but by teaching a scientific truth. It was a great organisation for educating the country in political economy. The leading principles of this science were so little known when the League began, and had been so effectually promulgated before its end, that a majority of the parliament who, in 1841, had been elected for the support of protection, were converted to free-trade, the conversion including the prime-minister, Sir Robert Peel. The key-note to the literature of the League was struck by the beautiful logical exposition of free-trade in General Thompson's *Catechism of the Corn-laws*, which, with other tracts, was profusely dispersed over the country, while a large staff of lecturers aided in the task of education. Thinking to serve their cause in the same manner, the Protectionist party, at a meeting held in the Duke of Somerset's house, on 17th February 1844, founded 'The Agricultural Protection Society of Great Britain.' This body had inexhaustible wealth at command, but in reality its exertions only helped to further the cause of free-trade, by promoting discussion, and prompting people to work out the question for themselves.

ANTICO'STI, an island in the Gulf of St. Lawrence, with a light-house at its south-west extremity, which is in lat. 49° 24' N., and long. 63° 39' W. It is estimated to contain 2000 square miles. Neither to the settler nor to the mariner is A. of any value. It is destitute of harbours, the north shore being mountainous, and the south low and beset by shoals; while, to increase the danger, the neighbouring currents are said to be capricious. The climate is severe; while the surface is an alternation of rocks and swamps. The only inhabitants are the keepers of the light-house.

A., however, is of use, or promises soon to be so, in connection with the transmission of submarine telegraphs across and along the Gulf of St. Lawrence. It has also been proposed to construct here a harbour of refuge by means of convict labour.

ANTIDOTE (Gr. given against), a counter-poison. See POISON.

ANTI'GONE, a character of the heroic age of Greece, daughter of Œdipus by his own mother Jocasta, was sister to Eteocles, Polynices, and Ismene. She accompanied her father in his exile into Colonus in Attica, and after his death, returned to Thebes. Eteocles, the king, had banished his brother Polynices, who, coming back with an army, engaged him in single combat. Both fell, and Creon, who after their death had become tyrant of Thebes, issued an edict forbidding their interment. A. alone dared to disobey. She buried Polynices, and was in consequence seized by the monster, who shut her up, either in the same tomb with her brother, or in a subterranean cave, where she perished. This sentence threw Hæmon, son of Creon, who was betrothed to A., into such despair that he destroyed himself. A., as the ideal of feminine duty and filial devotion, has been immortalised by Sophocles in his dramas of *Œdipus at Colonus* and *Antigone*.—A., daughter of Eurytion, and wife of Pelæus, who hanged herself upon hearing a false report of her husband's marriage to Sterope, daughter of Acastus.—A., daughter of Laomedon, and sister of Priam, who, having offended Juno by comparing her own beauty to that of the goddess, had her hair turned into snakes, which so tormented her that the gods, in compassion, changed her into a stork.

ANTI'GONUS. Of the numerous persons who bore this name, the most celebrated was the son of Philip of Elymiotis, and one of the generals of Alexander the Great. In the division of the empire which followed the death of his master, A. received the provinces of Phrygia-Major, Lycia, and Pamphylia. Being accused of disobedience by Perdiccas, who wished to gain possession of all the territories left by Alexander, A. entered into alliance with Craterus, Antipater, and Ptolemæus, and declared war against Perdiccas in 321 B. C. In the same year, Perdiccas was assassinated by his own soldiers; but A. carried on the war against Eumenes, to whom Perdiccas had given rule over Paphlagonia and Cappadocia. Eumenes, and afterwards Seleucus, who reigned in Syria, were deposed by A., whose ambition and cupidity now knew no bounds. He seized the treasures of Alexander kept at Ecbatana and Susa, which he refused to share with his allies, Ptolemæus, Cassander (son of Antipater), and Lysimachus. All the other generals now allied themselves against him, and a long series of contests took place in Syria, Phœnicia, Asia Minor, and Greece, which ended with the battle of Ipsus, in Phrygia (301 B. C.), when A. was slain, in his eighty-first year.

ANTI'GONUS GONA'TAS was the son of Demetrius Poliorcetes, king of Macedonia, and grandson of the great Antigonus. On his father's death, B. C. 283, various claimants for the throne

appeared, and much confusion ensued, the result of which was that the royal power fell into the hands of Ptolemaeus Ceraunus, who, however, soon after perished in a battle with the Gauls, when A. G. at length became ruler of the country (277 B.C.), and governed precariously in that age of intrigue, dissimulation, and violence, for 33 years. He was twice expelled from his dominions by a hostile force from Epirus, but found refuge and assistance in the Peloponnesus. The close of his career was comparatively peaceful. He died in 243 B.C.

ANTIGUA, a West India island, the most important of the Leeward Caribbees (see ANTILLES) and the residence of the governor-in-chief of the British portion of the group. It lies in W. long., between $61^{\circ} 44'$ and $61^{\circ} 58'$; and in N. lat., between $17^{\circ} 2'$ and $17^{\circ} 13'$. Its area is estimated at 110 square miles—equal to 70,400 acres, of which 60,000 are under cultivation. In 1862, the population of A. was 37,125, yielding to a square mile an average of about 338 inhabitants. It was first settled in 1632, having till then remained, in fact, uninhabited on account of the great scarcity of fresh water. It has twice suffered severely from earthquakes—in 1689 and 1843; while of hurricanes also, the other heavy scourge of the group, A. has had its full share. Numerous islets, rocks, and shoals border the shore, so that, generally speaking, access is difficult and dangerous. But St. John's, the chief town, stands at the head of a safe and capacious bay, which unfortunately, however, does not admit large vessels. English Harbour is, on the whole, a more commodious port, and has been selected as the station of the Royal Mail Steam-packets. It is said to be capable of receiving the largest ships in the British navy.

A. is chiefly of tertiary formation. The south and west shew grauwacke, porphyry, trap, breccia, amygdaloid, and basaltic greenstone; the north and east exhibit calcareous marl, and coarse sandstone, interspersed with blocks of limestone; while the interior presents argillaceous strata, and irregular beds of coarse flint.

Besides provisions, generally almost sufficient for its own consumption, A. produces large quantities of sugar, molasses, and rum. In this respect, the emancipation of the slaves appears to have been rather beneficial than otherwise, as the following table indicates:

Commerce.	1833.	1867.
Imports (value) . . .	£69,945	£190,342
Exports, do.	206,464	141,077
Sugar crop (hogsheads), 1866	12,189	17,330
Molasses (puncheons), “	7,177	7,852
Tonnage (entered & cleared),	22,790	43,906

In connection generally with the emancipation of the slaves, of whom immediately previous to the abolition of slavery, A. had about 30,000, it seems to have occupied a prominently creditable position. Immediately after the passing of the imperial statute on the subject, the local legislature, rejecting the intermediate and probationary state of apprenticeship, proclaimed unqualified freedom for 1st August 1834—a bold measure, which proved to be as judicious as it was humane.

ANTILLES, a term used to designate generally the whole of the West India islands, except the Bahamas. Generally speaking, they stretch eastward from the Gulf of Mexico to about the meridian of the Gulf of Paria; then southward to the Gulf of Paria itself; and lastly, westward to the Gulf of Maracaybo. Primarily, however, they are regarded not as three sections, but as two—the Greater A., to the north and west; and the Lesser,

to the east and the south. This distinction, which obviously involves considerations of position as well as of magnitude, will be found to indicate also a difference of organic structure.

The Greater A., reckoning from the West, are: Cuba (Spanish), Jamaica (British), Hayti (independent), and Porto Rico (Spanish). They extend, in W. long. from $84^{\circ} 58'$ to $65^{\circ} 40'$, and in N. lat. from $23^{\circ} 9'$ to $17^{\circ} 40'$ —the higher of these two parallels being only 21' or about 25 miles within the Tropic of Cancer. On the lowest estimate, the area is said to amount to 70,000 square miles. The Greater A. appear to be of primitive formation, presenting lofty granitic mountains. In Jamaica, however, there are many hills of calcareous origin.

The Lesser A. may be divided into two chains—the eastern, trending round from the eastward of Porto Rico to the Gulf of Paria; and the southern, stretching away in a direction nearly parallel with that of the Greater A., along the coast of Venezuela as far as the Gulf of Maracaybo. With reference to the prevailing trade-wind, these two chains are respectively designated the Windward and the Leeward Islands.

The Leeward Islands, reckoning from the north, come in pretty nearly the following order: Virgin Islands (Danish and British), Anegada (British), Anguilla (British), St. Martin (French and Dutch), St. Croix (Danish), Saba (Dutch), St. Bartholomew (Swedish), St. Eustatius (Dutch), Barbuda (British), St. Christopher's (British), Nevis (British), Antigua (British), Montserrat (British), Desada (French), Guadalupe (French), Marie Galante (French), Dominica (British), Martinique (French), St. Lucia (British), Barbadoes (British), St. Vincent (British), Grenadines (British), Grenada (British), Tobago (British), Trinidad (British), comprise the Windward Islands. They extend from near Porto Rico, long. $65^{\circ} 30'$ W., to $59^{\circ} 20'$, at the east extremity of Barbadoes; and in N. lat. from $18^{\circ} 48'$, at the north extremity of Anegada, to $10^{\circ} 31'$, at the south extremity of Trinidad. The entire area perhaps scarcely equals 5000 square miles, being not materially larger than that of Jamaica alone.—The Windward Islands are otherwise called the Caribbees, from the now extinct race of the Caribs (q. v.); and hence the sea, which they cut off from the open Atlantic, has taken the name of Caribbean.

The islands near the South American coast may be given as follows: Testigos (Venezuelan), Margarita (Venezuelan), Tortuga (Venezuelan), Blanquilla (Venezuelan), Buen Ayre (Dutch), Curaçoa (Dutch), Aruba (Dutch). They extend in W. long. from $63^{\circ} 12'$, at the east end of the Testigos, to $70^{\circ} 11'$ at the west end of Aruba; and in N. lat. from 11° , at the south of Margarita, to 12° , at the north of Curaçoa. Their entire area cannot exceed 1500 square miles.

The Lesser A., as a whole, appear to be chiefly of coral formation, or of volcanic origin. Many of them contain extinct craters; and, though not destitute of harbours, their coasts are rendered in a great measure inaccessible by reason of reefs.

The A. generally—but perhaps the Lesser more so than the Greater—are subject to hurricanes and earthquakes. Their principal productions are sugar, rum, cotton, coffee, &c. The individual islands will be found noticed more in detail in their respective places.

The name A. is generally supposed to have been given by mistake to the West Indian Islands. Before the discovery of America by Columbus, a tradition existed that far to the west of the Azores there lay a land called Antilla, whose position was vaguely indicated in the maps of the early cosmographers. Only eight months after Columbus's return we find

one Peter Martyr writing that the islands which the great navigator had touched upon, must be the Antilles; and it is certain that Cuba and Hayti were known as such before a single link in the Caribbean chain was discovered.

ANTILOPE. See ANTELOPE.

ANTIMONY (in Lat. *Stibium*; hence the chemical symbol *Sb*) is a brittle metal of a flaky, crystalline texture, and a bluish-white colour. It is readily reduced to powder by ordinary pulverization; when heated to 840° F., it fuses, and thereafter being allowed to cool, it solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, A. volatilises as the vapour of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the teroxide of A., or 'flowers of A.' The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bismuth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, A. does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders A. of essential service in the useful arts, in the construction of alloys, such as Britannia metal, type metal and plate pewter. It is likewise employed in the preparation of the large concave mirrors used in astronomical observations; and in the casting of bells, to make them harder and whiter, and to give them a clearer and stronger sound.

The principal natural sources of A. are—grey or crude A. of commerce, which is the impure tersulphuret of A. (SbS_3); and native A., in which it occurs in the metallic state associated with silver, iron, and other metals. The extraction of A. from its ores is mainly carried on at Linz, in Germany, where the sulphide of A. is found extensively, and in Great Britain, which receives its supply of ore from Singapore and Borneo, commonly as ballast. The process consists in heating the crude ore, covered with charcoal on the bed of a furnace, when the sulphide of A. fuses, leaving unmelted the earthy impurities; and thereafter the liquid is drawn off into iron moulds, where it solidifies into cakes or loaves. The latter are reduced to coarse powder, placed on the bed of a reverberatory furnace, and heated with access of ordinary air containing oxygen, when the sulphur passes away as gaseous sulphurous acid SO_2 , leaving behind the A. as the trioxide SbO_3 . The roasted mass is now mixed with one-sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda, and raised to bright redness in crucibles, when the metal A. trickles to the bottom, and the impurities are left above in the spent flux or scoria, which is known in the arts by the name of *crocus* of A.

The compounds of A. are numerous: with oxygen it forms (1) the teroxide of A., or white A. ore (SbO_3), which enters into the composition of tartar emetic; (2) antimonious acid (SbO_4), which forms one of the components of Dr. James's powders; (3) antimonious acid (SbO_3), a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, A. forms the tersulphide SbS_3 , already referred to as a natural ore of the metal, and which when roasted at a temperature sufficient to fuse it, passes into the mixed teroxide and tersulphide of A. known commercially as the *glass* of A. A native oxysulphide, of a pretty red colour, is called red A. ore. When the ordinary sulphide of A. is boiled with potash, or the carbonate of potash, it dissolves; and thereafter, on boiling, deposits a

reddish-brown substance known as *mineral kermes*. The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of A.

There is also a chloride of A. ($SbCl_3$) prepared by heating sulphide of A. and hydrochloric acid together, and which has the common name of *butter* of A. It is generally obtained as an oily liquid, of the consistence of melted butter, and of a golden yellow colour. Mixed with olive oil, it is used by gunmakers as *bronzing salt*, to impart a yellow colour to gun-barrels. The surface of the metal is afterwards polished by a burnisher, or coated with a varnish.

The various compounds of A. are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic*, a compound of teroxide of A., potash, and tartaric acid (SbO_3, KO, T).

ANTINOMIANISM (Gr. *anti*, against, and *nomos*, law), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by the advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi., and 2 Pet. ii. 18, 19, it would seem that a tendency to A. had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the middle ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by John Agricola. Agricola had adopted the principles of the Reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the ten commandments, in order to produce conviction and repentance, which he deemed inconsistent with the gospel. Ten years after, he maintained in a disputation at Wittenberg, that as men are justified simply by the gospel, the law is in no way necessary for justification or for sanctification. The 'Antinomian Controversy' of this time, in which Luther took a very active part, terminated in 1540 in a retraction by Agricola; but views more extreme than his were afterwards advocated by some of the English sectaries of the period of the Commonwealth; and, without being formally professed by a distinct sect, A. has been from time to time reproduced with various modifications. It ought, however, to be borne in mind, that the term A. has no reference to the *conduct*, but only to the *opinions* of men; so that men who practically disregard and violate the known law of God, are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian, have in many cases been men of moral life. It is also to be observed that the term A. has been applied to opinions differing very much from each other. In its most extreme sense, it denotes the rejection of the moral law as no longer binding upon Christians; and a power or privilege is asserted for the saints to do what they pleased without prejudice to their sanctity; it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme A., than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to seek or to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of gospel principles and the constraint of Christian love; an opinion which, whatever may be thought of its tendency, is certainly not to be deemed of the same character with the other. Probably, the A. that does not arise out of a dislike

of morality, usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

ANTINŌUS, a beautiful youth of Claudiopolis, in Bithynia. He was page to the Emperor Hadrian, and the object of his extravagant affection, accompanying him in all his travels, but was either drowned accidentally in the river Nile, or as some suppose, committed suicide, from a loathing of the life he led, in 122 A.D. His memory and the grief of the emperor were perpetuated by many statues and bas-reliefs, of which several are very beautiful, especially two now in Rome—one found in the baths, and the other in the villa of Hadrian. 'In all figures of A,' says Winckelmann, 'the face has a rather melancholy expression; the eyes are large, with fine outlines; the profile is gently sloped downwards; and the mouth and chin are especially beautiful.' The city of Besa, in the Thebais, near to which A. was drowned, was also rebuilt by Hadrian, and the name of Antioöpolis conferred upon it, in memory of his favourite. A. was further enroled amongst the gods, and temples erected to him in Egypt and Greece.

ANTIOCH, the ancient capital of the Greek kings of Syria, was the most magnificent of the sixteen cities of that name built by Seleucus Nicator. Its situation was admirably chosen. The river Orontes, issuing from the mountains of Lebanon, flows north as far as the 36th parallel of latitude, and then south-west into the Levant. On the left bank of the river, after it has taken this last direction, and at a distance of twenty miles from the sea, lay the famous city, in the midst of a fertile and beautiful plain, ten miles long by five broad. By its harbour, Seleucia, it had communication with all the maritime cities of the West, while it became, on the other hand, an emporium for the merchandise of the East; for behind it lay the vast Syrian desert, across which travelled the caravans from Mesopotamia and Arabia. On the north, the plain of A. is bounded by the mountain-chain of Amanus, connected with the south-eastern extremity of Mount Taurus; and on the south, which is more rocky, by the broken declivities of Mount Casius, from which the ancient town was distant less than two miles. In early times, a part of the city stood upon an island, which has now disappeared. The rest was built partly on the plain, and partly on the rugged ascent towards Mount Casius. The slopes above the city were covered with vineyards, while the banks of the river displayed, as they do even at the present day, a gorgeous profusion of eastern fruit-trees. The ancients called it 'A. the Beautiful,' 'the Crown of the East,' &c. It was a favourite residence of the Seleucid princes and of the wealthy Romans, and was famed throughout the whole world for the abundance of its conveniences and the splendour of its luxury. It received from Strabo the name of *Tetrapolis*, on account of three new sites having been successively built upon, and each surrounded with a wall. Its public edifices were magnificent. The principal were—the Palace; the Senate-house; the Temple of Jupiter, burnished with gold; the Theatre, Amphitheatre, and Cæsarium, besides an aqueduct, a public promenade, and innumerable baths. At the beginning of the Roman empire, it was as large as Paris, and for many generations after, continued to receive numerous embellishments from the emperors. Nor did its glory fade immediately after the founding of Constantinople, for though it then ceased to be the first city of the East, it rose into new dignity as a Christian city. Ten councils were held in it.

Churches sprang up exhibiting a new style of architecture, which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbour, Seleucia. The Antiochenes themselves, however, brought about the ruin of their beautiful city. They were famous, above all other people in ancient times, for their biting and scurrilous wit, and for their ingenuity in devising nicknames; and when the Persians, under Chosroes, invaded Syria in 538 A.D., the Antiochenes could not refrain from jesting at them. The Persians took ample revenge by the total destruction of the city, which, however, was rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the 7th c. In the 9th c. it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it on the 3d of June 1098. At the close of the 13th c., the sultan of Egypt seized it: since then, it has undergone a variety of vicissitudes, and at present forms a portion of Syria, in the eyalet of Aleppo. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of the walls built by Justinian, and of the fortress erected by the Crusaders. The houses are generally of stone, and roofed with red tiles; the streets are narrow; the manufactures few and unimportant, and the population not more than 6000 or 7000.

ANTIOCHUS, a common Greek name, was borne by thirteen kings of Syria, four kings of Commagene (a small country between the Euphrates and Mount Taurus), and many other persons of note (see Smith's *Dictionary of Greek and Roman Biography*). A. Soter, the first of the Syrian dynasty, or Seleucidæ, as they were called from their founder, was the son of Seleucus, the general and one of the successors of Alexander. A. was the fruit of one of those marriages which Alexander celebrated at Susa between his generals and the princesses of Persia. His mother's name was Apama. From this fact we gather that A. was probably born in 324 B.C. For the earlier career of A., see SELEUCUS. On the murder of his father in 280 B.C., A. succeeded him in his dominions, but he afterwards permitted Antigonus Gonatas to retain possession of Macedonia on his marrying Phila, a daughter of Seleucus. A. was much occupied in wars with the Gauls, who invaded Asia Minor, and, on one occasion, is said to have gained a victory over them by the help of his elephants, from which circumstance he derived the name of Soter (Saviour). He was subsequently killed in a battle with the Gauls (261 B.C.), and was succeeded by his son A. II. This A. is mentioned in the Book of Daniel (xi. 6) as the king of the north—the king of the south being Ptolemy, whose daughter, Berenice, A. had been compelled to marry. On the death of Ptolemy, A. recalled his former wife, Laodice; but she, in revenge for the insult which she had received, caused A. to be murdered, along with Berenice and her son. A. lost the provinces of Parthia and Bactria.

But the most distinguished of the Selucidæ was A. III., surnamed the Great, who was the son of Seleucus Callinicus, and grandson of the preceding. In his earlier wars with Ptolemy, Philopator A. was generally successful; and though he was defeated in a great battle fought near Gaza, he afterwards, by his victory over the Egyptian general, Scopas, obtained entire possession of Palestine and Coele-Syria. In this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, A. at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy.

and gave her Cœle-Syria and Palestine as a dowry. The formidable enemy which he thus hoped to escape encountered him at a later period of his career. Having conquered Philip of Macedonia, the Romans no longer dreaded a war with A., and accordingly sent him an embassy, demanding the surrender of the Thracian Chersonese, and of the places which he had conquered from Ptolemy, whose guardian the Romans had become. In 191 B.C., he was entirely defeated by the consul Acilius Glabrio at Thermopylae, and compelled to return to Asia. Having a second time tried the fortune of war, he was defeated by Scipio, who had crossed over into Asia, and very severe terms were imposed on him. He found so much difficulty in raising money to pay the tribute the Romans demanded, that he was led to plunder a temple in Elymais, when the people rose against him, and killed him (187 B.C.). The fate of A. was foretold in the Book of Daniel (xi, 18, 19).

A. IV., (175—164 B.C.) surnamed Epiphanes, by his tyranny and sacrilege, excited the Jews to a successful insurrection under their leaders Mattathias, Judas Maccabæus, and the other members of that heroic family. The monstrous life of A. is recorded in the books of the Maccabees. The last of the Seleucidæ, A. XIII., surnamed Asiaticus, was deprived of his kingdom by Pompey, who reduced Syria to a Roman province (65 B.C.).

ANTI-ÆDOBAPTIST, a term exactly designating one who objects to child-baptism. As such a one, however, is generally known in this country under the name Baptist, see BAPTIST.

ANTI-PAROS (anciently called Olearos or Oliaros), one of the Cyclades islands, celebrated for a stalactitic cave, is separated from Paros by a narrow strait. It contains about 400 inhabitants, and forms a part of the eparchy of Naxos. A. is 7 miles in length by about 3 in breadth; it is scantily supplied with water, but the flats in the north and west are tolerably fertile. Corn and wine are cultivated, but not to any great extent. The principal occupation of the inhabitants is fishing. From Kastron, the only village in the island, the distance to the celebrated grotto is about an hour and a half's ride. This wonderful cave is not alluded to by any Greek or Roman writer whose works are extant, but must have been visited by the curiosity hunters of antiquity, for, in 1806, Colonel Leake deciphered a Hellenic inscription which contained the names of those who had descended into it in ancient times. It is situated in the side of a mountain on the S. coast of the island, which is described as a mass of white marble. The top or entrance to the cave has a striking appearance; but the sloping descent is rather dangerous, on account of the cord by which the traveller holds being extremely slippery from constant humidity. The bottom once reached, and the grotto entered, there is presented to the eye as dazzling a specimen of stalactitic formation as can well be conceived—the roof, floor, and walls of the various chambers, all glittering with the most gorgeous incrustation, though it is said that the smoke of the torches and the constant fingering of visitors, are sulling the primitive purity of the massive columns. It is believed that there are other caves of equal splendour in the vicinity which have not yet been discovered. The height of the known cavern is 80 feet; its length and breadth more than 300; but it seems the eye can only take in at once a length of 150 feet, and a breadth of 100. The grotto was first made known to the modern world in 1673, by the then French ambassador to the Porte, M. de Nointel.

ANTI-PATER. Of the many persons who bore

this name in antiquity, the most celebrated was one of the generals and confidential friends of King Philip of Macedon. When Alexander led his troops into Asia, he left A.—who, along with Parmenion, had endeavoured to dissuade him from the expedition—as governor of Macedonia. A. discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but Olympias, the mother of Alexander, who entertained a dislike to A., prevailed on her son to appoint Craterus as regent of Macedonia. Alexander, prompted also, it is supposed, by his own jealousy of A., consented, but died before the change was carried into effect; and A. was left to share with Craterus the government of Alexander's territories in Europe. The government of Macedonia was assigned to him; and soon after, he was called upon to defend himself against an alliance of the Grecian states. With the assistance of Craterus—on whom he afterwards bestowed his daughter Phila in marriage—and to a certain extent of Leonnatus, he succeeded in reducing the allies to subjection. Democracy at Athens was abolished, a garrison admitted into Munychia, and the leaders of the popular party put to death. When Demosthenes was summoned to the presence of A., he took poison, which for some time he had been carrying on his person, and died in the temple of Poseidon (322 B.C.). This war was followed by another with Perdiccas, who was also his son-in-law, in which A. was again successful. After the murder of Perdiccas in 321 B.C., A. was appointed to the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age, in B.C. 318 or 319, leaving the regency to Polysperchon, to the exclusion of his own son Cassander.

The others of this name were: I. A., second son of Cassander, king of Macedonia, who lived in the 3d. c. B.C.—II. A., the father of Herod the Great. He flourished in the days of Pompey and Julius Cæsar, was a firm friend of the Romans, and about the year 47 B.C. was appointed procurator of Judea. He was poisoned in 43 B.C. by one whose life he had twice saved.—III. A., grandson of the former, and son of Herod the Great by his first wife Doris, a worthless prince, who was perpetually conspiring against the life of his brothers, until his trial and condemnation at Jerusalem before Quintilius Varus, the Roman governor of Syria. He was executed in prison five days before Herod died, and in the same year with the massacre of the innocents at Bethlehem.

A. was likewise the name of various eminent men in ancient times—physicians, philosophers, historians, poets, mathematicians, and grammarians.

ANTI-PATHY is the term applied to a class of cases in which individuals are disagreeably affected by, or violently dislike, things innocuous or agreeable to the majority of mankind. These peculiarities are no doubt sometimes acquired in early life by injudiciously terrifying children with some object, the mental impression becoming permanent. A large class of persons have an A. to animal food, and from childhood refuse to taste it. In others, again, the aversion is limited to one kind of meat, as veal or pork; others are averse to eggs or milk. Nor is this feeling a conscious caprice, which an exertion of the will might remove; for it is generally found that contact with the object of the A. is resented by the bodily economy, and symptoms of poisoning are rapidly produced. Some are affected with these symptoms who have no mental aversion to the article. We read of a countess who had a liking for beef-udder, but directly it touched her lips they became swollen. There is also the case of a boy, who, 'if at any time he ate of an egg, his lips

would swell, in his face would rise purple and black spots, and he would froth at the mouth. Some medicines affect particular persons dangerously, even when given in very minute doses: a single grain of mercury has been known to induce a profuse salivation, with destruction of the jaw-bones. On others, medicines have a peculiar effect—astringents may purge. Every summer in Great Britain, persons may be seen with the most distressing irritation of the nasal and palpebral mucous membranes, produced by the exhalations arising from the fields during the inflorescence of the hay-crop. In others, an asthmatic condition is induced by the same cause. The air of some places has a similar influence on individuals: one gentleman was always attacked with asthma if he slept in the town of Kilkenny, and another rarely escaped a fit of that complaint, if he slept anywhere else.

The most remarkable antipathies are those affecting the special senses. Nearly all persons have a loathing at reptiles, but some few *faint* on seeing a toad or lizard, others on seeing insects. 'The Duke d'Epéron swooned at the sight of a leveret—a hare did not produce the same effect. Tycho Brahé fainted at sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert, at a pig.'—*Millingen*.

Hearing a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen how articles of food affect others—often, no doubt, owing to perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Zimmerman records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety skin of a peach.—This subject will be further considered under IDIOSYNCRASIES.

ANTIPIHLOGISTIC (Gr. *anti*, against, and *phlego*, I burn), a term applied to remedies, and also to regimens, that are opposed to inflammation; such as blood-letting, purgatives, low diet, &c.

ANTIPHON, the earliest of the ten Attic orators in the Alexandrine canon, was the son of Sophilus the Sophist, and born at Rhamnus in Attica 480 B. C. In his youth, the reputation of Gorgias, the most showy and insincere of all the Greek rhetoricians, was at its height. A. soon became convinced of the worthlessness of that oratory which the fashion of the time so highly valued, and resolved to introduce a new and better kind. He laboured to make his arguments clear, solid, and convincing, so that it might be impossible for the judges who listened to the speeches he wrote to refuse their assent to his propositions. His success was unmistakable. Although he never made a public appearance as a pleader in the courts of justice, but contented himself with writing speeches for others to deliver, he acquired great influence, which he did not fail to exert for the furtherance of his political principles. To him must be attributed the overthrow of the Athenian democracy (411 B.C.), and the establishment of the oligarchical government of the Four Hundred; for although Pisander figured prominently before the people in this revolution, the whole affair, according to Thucydides—one of A.'s pupils in oratory, and a man admirably fitted to judge of such a point—was secretly planned by him. The oligarchical government did not prosper. Dissensions quickly broke out among the Four Hundred, and six months after, Alcibiades, the brilliant demagogue, was recalled. A. was brought to trial for treason, in having attempted to negotiate peace with Sparta. He is said to have made a noble defence of himself. Thucydides affirms that an abler was never made by any man in a similar

position. It was his first and last oration. He was condemned to death: his property was confiscated, his house razed to the ground, his remains forbidden interment in Attica, and his children for ever declared incapable of enjoying civic privileges. Of the 60 orations of A. which the ancients possessed, only 15 have come down to us. Three of these are written for others, and are greatly admired for their clearness, purity, and vigour of expression; the remaining 12 appear to have been intended as specimens of school-rhetoric for his pupils. They are not held in equal estimation with the others.

ANTIPHONY, a name given by the ancient Greeks to a species of musical accompaniment in the octave, by instruments or voices, in opposition to that executed in unison, which they called *Homophony*. A. is also the name of a species of sacred song, sung by two parties, each responding to the other; a practice which was cultivated in the early ages of the Hebrews, Greeks, and Romans. Many of the Psalms of David show that antiphonal singing was then in use. Its introduction into the Greek Church is ascribed to Ignatius, Bishop of Antioch, in the 2d c.; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western Church, in the 4th c. The dividing of the antiphonies into verses, with rules regarding the same, is attributed to Pope Celestin in 432. Pope Gregory I., in 590, prepared the first regular *Antiphonarium* (see *Durandi Rationale Divinorum Officiorum*, Mainz, 1459). It was early a custom, which became especially common after the 13th c., to date deeds with the beginning words of the A. (*Introitus*), which in these times served for the day of the month and of the week. The Reformed Christian Churches of Germany and England have still retained a certain degree of antiphonal singing. The chanting of the Psalms in the English cathedral service is an imitation of the ancient antiphony.

ANTIPODES, a word of Greek origin, signifying, literally, those who have their feet over against each other. As applied to geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation, there necessarily arise many secondary relations. A. must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in long. exactly 180°, with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equi-distant from the equator in opposite directions. Take Edinburgh, as an example, in lat. 55° 57' N., and long. 3° 11' W.; its A. must be in lat. 55° 57' S., and in long. 183° 11' W., or rather in 176° 49' E—which is merely an undistinguishable spot in the Antarctic or Southern Ocean. Take, as another example, London, in lat. 51° 30' N., and long. 0° 5' W. Its A. must be in lat. 51° 30' S., and in long. 180° 5' W., or rather 179° 55' E.—coinciding pretty nearly with a small island to the south-east of New Zealand. This small island, in honour rather of London than of itself, has appropriated the term A. as its own peculiar name.

Between A. in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. With respect, however, to the former contrast, some explanation may be required. This,

for instance, being Wednesday in London, was last midnight in that city the noon of Tuesday or of Wednesday at A. Island? The answer is, that according to circumstances, it may be held to be either the one or the other. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4° of time to 1° of long., or of 12 hours of time to 180° of long.; so that, on reaching A. Island from London by the Cape of Good Hope, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Wednesday. In going westward, again—that is, in leading, as it were, the sun—one, from day to day, postpones every noon and every midnight in the same proportion as above; so that, on reaching A. Island from London by Cape Horn, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Tuesday. In fact, navigators in opposite directions, meeting at any intermediate point whatever of the earth's circumference, always differ in their computation of time by a whole day, or 24 hours. In two cases, this has been permanently exemplified: the Spaniards at the Philippines, who have come from the east, are a day behind the Portuguese in Macao, who have come from the west; while, on the north-west coast of America, the Russians from the west are a day in advance of the British from the east.

ANTIPOPE was a pontiff elected by the will of a sovereign, or the intrigues of a faction, in opposition to one canonically chosen. The emperors of Germany were the first to set up popes of their own nomination against those whom the Romans had elected without consulting them. Otto the Great displaced successively two bishops of Rome; and when Sylvester III. had expelled from the capital of Christendom Benedict IX., whose profligacy had compromised in the eyes of all men the honour of the sovereign pontificate, Conrad II., king of Germany, brought back this worthless pastor, who hastened to sell his dignity to Gregory VI. There were now, consequently, three popes, and their number was increased to four by the election of Clement II. in 1046. Shortly after, Alexander II. found a rival in Honorius II.; and in 1080 the same unseemly spectacle was witnessed, when Henry IV. emperor of Germany, elevated to the papal chair Guibert of Ravenna, under the title of Clement III., in opposition to his implacable adversary, Gregory VII. But after the death of Gregory, Clement was himself opposed successively by Victor III. and Urban II., and at last died at a distance from Rome, having just beheld the exaltation of Pascal II. as the successor of Urban. During the 12th c., several antipopes flourished, such as Gregory VIII. and Honorius III. On the death of the latter, France began to intermeddle in these disgraceful strifes, and upheld the cause of Innocent II. against Anaclet; while the kings of Sicily, on the other hand, frequently set up a pontiff of their own against the choice of the emperors. The 13th and 14th centuries swarm with antipopes; but what specially deserves notice is 'the great schism of the West,' produced by these shameless rivalries in 1278—a schism which divided the Church for fifty years. It broke out after the death of Gregory XI., at the election of Urban VI., whom the voice of the Roman people, demanding an Italian pope, and not one who should fix his pontificate, like several of his predecessors, at a distance from Rome, had elevated to the papal throne. The French cardinals objected, withdrew to Provence, and elected a new pope, under the name of Clement VII., who was recognised by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe,

supported Urban VI. These two popes excommunicated each other; nor did they even fear to compromise their sacred character by the most cruel outrages and the most odious insults. The schism continued after their death, when three popes made their appearance 'in the field,' all of whom were deposed by the Council of Constance in 1415, and Cardinal Colonna elected in their room, under the title of Martin V. The last antipope was Clement VIII. With him the schism ceased; but the evil was done, and nothing could remedy it. The dogma of papal infallibility had received a mortal wound 'in the house of its friends,' and the scepticism induced on this point rapidly extended to others. See POPES.

ANTIQUARIES, SOCIETY OF. Under this name, associations of learned men, established for the exclusive purpose of cultivating the study of antiquities, exist in the principal countries of Europe and in America—at London, Edinburgh, Paris, Rome, Vienna, Copenhagen, &c. The London Society of A. received its charter in 1751, but had commenced its meetings as early as 1707; minutes began to be kept in 1718. Long previous to this, in 1572, an Antiquarian Society was established by Archbishop Parker and Sir Robert Cotton. It was dissolved about the year 1604 by King James, whose weak and narrow mind regarded the inquiries of the A. with suspicion. The present 'Society of A. of London' consists of a President, a Council of 21, and several hundred Fellows. It has published a large number of curious and valuable works, among the most interesting of which is a series of Anglo-Saxon and early English literary remains. The Scottish Society of A. was founded in 1780. It has published four volumes of Transactions, and collected a valuable museum, which is now become national property, and is arranged for permanent exhibition at the expense of the government. The *Société des Antiquaires de France* took that name in 1814, having been founded in 1805 as the *Académie Celtique*. With the change of name, the sphere of the Society's labours was greatly enlarged. It has published many important works. A similar institution is the *Société des Antiquaires de Normandie*, founded at Caen in 1824. The Copenhagen Society of A. is a body of high reputation. See ARCHEOLOGY.

ANTIQUE. As the term ancients is commonly applied to the Greeks and Romans, the word A. is used with reference to their works of art, especially their incomparable sculptures. The A. Style in works of art is distinguished by critics from the Romantic or Medieval, and also from the Modern. The sculpture of the Greeks is characterised by freshness, originality, and ideality; and the phases it underwent have their parallels in the development of the literature and general culture of that people. In the earliest times, the statues had a rigid, formal character, and looked more like the idols of barbarous nations than deities in human form; then came stern, Titan-like forms, corresponding with the Prometheus of Æschylus; next the sculptures of Phidias, Polycletus, and Polygnotus—like the characters in the dramas of Sophocles—present to us humanity in its purest and noblest ideal forms. Then, as Euripides in poetry left the old domain of destiny, and derived motives and action from ordinary human passions, so statuary descended from the ideal to a closer resemblance to the forms of actual life; as we see in the works of Praxiteles and Lysippus. Afterwards, when Aristophanes introduced comedy, forms of everyday-life began to appear in sculpture; and thus a gradual transition was made from the art of the Greeks, which was ideal, in the true sense of the word to that of the Romans, which was real, monumental, and portrait.

like. The Romans were the realists of the ancient world; their indigenous philosophy was of a popular kind; their poetry, so far as it was national, was satire; and their works of art may be regarded as monuments and portraits of real life, quite suitable for a nation of soldiers, lawyers, and politicians, but vastly inferior to the ideal beauty displayed in the best period of Grecian art.

ANTIQUITIES. See ARCHÆOLOGY.

ANTIRRHINUM. See SNAPDRAGON.

ANTISCORBUTICS. See SCURVY.

ANTISEPTICS are substances which arrest the putrefactive changes that dead vegetable and animal matter is liable to undergo when exposed to air, warmth, and moisture. A. are therefore antiputrescents; and the term itself indicates the office which the members of the class fulfil (*anti*, against, and *septikos*, putrefactive). The theory of the action of all A. is, the tone or two of the three indispensable conditions of putrefaction—viz., 1, a moderate warmth, 2, access to air, and 3, moisture—are arrested or neutralised. Thus, in the preservation of fish in stores or during transport by railway, they are packed in barrels with ice, which keeps down the temperature; and though air and moisture gain admittance, yet the putrefactive processes cannot proceed. The same preservative power of cold is observed naturally in the discovery of remains of elephants and other animals imbedded in the ice of the polar regions, and which doubtless have been locked up there for ages. In a less degree, the influence of cold as an antiseptic is observed in the longer time that meat, eggs, and other animal matters keep fresh in winter than in summer.

Again, warmth and moisture may be present, but if the air be excluded, putrefaction does not go on. The ordinary mode of preparing *preserved meats* affords the best illustration of this point. The substance to be preserved is placed in a tin dish covered over, and leaving a very small opening. When the can with its contents is heated, the air which fills up the pores of the solids, and is dissolved in the liquids, is driven off, and escaping by the aperture in the cover of the dish, leaves the contents devoid of air. If the opening be now closed with solder, the air is kept from returning; and whatever climate the can of preserved meat be sent to, yet so long as the tin casing remains good, and refuses to admit the air, so long will the contents continue wholesome and palatable. The common plan of preserving eggs by rubbing over the shell with tallow or oil, is founded on the principle of filling up the pores of the shell, so as to deny the admission of the air. Moisture is likewise necessary for the process of putrefaction. Thus, if the contents of an egg be thrown out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistence, and may be kept in this state for years without exhibiting the slightest symptom of passing into a putrescent or rotten condition. In the same way meat may be kept quite fresh by depriving it of moisture. Eggs dried up in this manner require only to be soaked in cold water, and then boiled, when they will present themselves in a condition hardly differing in flavour and taste from an ordinary boiled egg.

The more important chemical A. are—Alcohol, wood-spirit, creosote, pitch-oil, coke-oil, sugar, tannic acid, sulphurous acid, common salt, nitre, alum, chloride of zinc, sulphate of copper (blue vitriol), corrosive sublimate, arsenic.

The manner in which these A. act is very different—1. Sulphurous acid acts by combining with the oxygen, and thereby deoxidising the substance.

2. Sirup of sugar acts by combining with the water of the substance to be preserved. 3. Creosote, tannic acid, alum, chloride of zinc, sulphate of copper, corrosive sublimate, and arsenic, are useful in forming compounds with the organic matter, which are not so liable to become putrescent as the uncombined organic substance. 4. Alcohol, wood spirit, common salt and nitre, act in a double way, by combining with the water of the putrescible substance, and by combining with the substance itself, so as to form a more durable compound.

Some of the more important uses to which the chemical A. are applied are—1. In the preservation of anatomical specimens, where alcohol, and less often, chloride of zinc, are the agents; 2. In the curing of herring and other fish, where common salt is generally used; 3. In preparing corned or salted meat and tongues, where common salt and nitre are jointly employed; and 4. In the manufacture of size for writing-papers, where the paper-maker uses sulphate of soda or antichlore (containing sulphurous acid) to arrest the decomposition of the scraps of hides used in the manufacture of size. In the preservation of timber, A. are also taken advantage of. The wood is placed in a steam-box, and the air contained in its pores being replaced by steam, the whole casing is closed tight, and allowed to cool, when the steam condenses, and leaves a vacuum in and around the block of wood. On the introduction thereafter of one of the A., it finds its way into the innermost pores of the timber. Wood thus prepared is not nearly so liable to decay as it ordinarily is; and the A. seem to act here not only directly in withdrawing water, and forming durable compounds, but in offering a poisonous dose to minute plants and animals which tend to house themselves in the wood. The use of sulphate of copper for this purpose was suggested by Bonchar-dat; of corrosive sublimate, by Kyan (hence the process was called *Kyanising*); and of chloride of zinc, by Sir W. Burnett (hence the term *Burnettising*).

ANTISTHENES, founder of the Cynic school of philosophy, was the son of A., an Athenian. The date of his birth is not known, but he fought in his youth at Tanagra (426 B.C.), and he survived the battle of Leuctra (371 B.C.), and died at Athens at the age of 70. After listening to the teaching of Socrates, he gave up the profession of rhetoric, which he had followed at first as a disciple of Gorgias, in order to apply himself wholly to the study of moral philosophy. He was present at the death of Socrates, and never forgave his persecutors. A. held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honours, and even learning. Opinions of still greater extravagance are ascribed to A., but it is probable that they were rather extreme views, which he put into the mouths of the interlocutors in his dialogues, than expressions of those which he himself entertained. Even in his condemnation of pleasure, he excepted such as springs from the soul, or is founded on true friendship. In consistency with his teaching, A. appeared as a beggar, clad in ragged garments—an eccentricity which Socrates is said to have reproved by saying, 'I see your pride through the holes in your cloak.' The singularity affected by A. gained many imitators, and among them Diogenes, who chose to live in a tub, and surpassed the master himself in Cynic practice. After the death of Socrates, A. taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which, it is said, his school derived its title. His writings—among them a polemical work against Plato—have mostly perished. Such fragments as remain have been collected by

Winckelmann (*A., Fragmenta*, Turici, 1842). Ritter classes A. with the 'imperfect Socraticists.'

ANTI'THESIS (*tithēmi*, to place, *anti*, against), a figure of speech in which words are placed in direct opposition to each other, to produce a strong contrast. Thus Lessing, in criticism on a book, says: 'It contains many good things, and many new; but the good are not new, and the new are not good.' A., when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated.

ANTITRINITARIAN, one who denies the doctrine of the Trinity. An A. differs from a Unitarian only in this respect, that his objection to the doctrine in question is made on philosophical, while that of the latter is made on theological grounds. A Unitarian is one who accepts the Bible as inspired, but does not find in it the doctrine of the Trinity; an A. is, or may be, a philosophical theist, who denies the inspiration of Scripture. Mohammed, from the stand-point of a new and hostile religion, also denied this great Christian dogma. He announced himself, with fierce emphasis, an A.; and his followers to the present day are characterised by the intensity of their monotheism. See UNITARIAN and SOCINIAN.

ANTITYPE, a Greek word, literally signifying a type or figure which corresponds to some other type or figure. In its theological sense, it denotes, not a type, but the person in whom any prophetic type is fulfilled; thus, Christ is called the A. of the paschal lamb. See TYPE.

ANTIUM, one of the most ancient cities of Latium, stood on the coast 34 miles S.S.E. from Rome. Being favourably situated for commerce and piracy, it became, under the Volscians, into whose hands it had fallen, one of the most powerful enemies of rising Rome, until finally subdued (338 B.C.). It became a favourite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the Emperors Caligula and Nero; and the latter constructed a splendid port by means of two moles enclosing a basin two miles in circumference. Remains of the moles still exist, although the basin is mostly filled up with sand.

Antium was completely destroyed by the Saracens during the middle ages; and it was only in the 17th c., when the port was very partially restored, that the modern village of Porto d'Anzo arose, the population of which does not exceed 500. Near the village Nettuno, in the neighbourhood, the ruins of a temple of Neptune are discernible under the sea.

ANT-LION, the larva of an insect (*Myrmoleon formicarium*) of the order Neuroptera, remarkable for its habits, which have been carefully observed by some of the ablest naturalists of Europe. It inhabits sandy districts, is not known in Britain, and is more common in the south of Europe than in the north. The perfect insect is about an inch long, and has a considerable general resemblance to a dragonfly. The larva is rather more than half an inch long; it has a very large abdomen, and a small head, which, however, is furnished with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally moves backwards. It feeds upon the juices of insects, particularly of ants, in order to obtain which it excavates with the greatest ingenuity a funnel-shaped hole in sandy ground, and lies in wait at the bottom, all but its mandibles buried in the sand. Insects which approach to near to the edge of the hole, then become its prey, by the loose sand giving way, so

that they fall down the steep slope. If they do not fall quite to the bottom, but begin to scramble up again, the A. throws sand upon them by jerking its

Ant-lion:

a, larva; b, perfect insect.

head, and so brings them back. It employs its head in the same way to eject their bodies from its pit, after their juices have been sucked, and casts them to a considerable distance; and by the same means throws away the sand in excavating its hole, first plunging it up with its body, and then placing it upon its head by means of one of its fore-legs. It always begins by working round the circular circumference of its future hole, and gradually narrows and deepens it; turning quite round after each time that it works round the hole, so as to employ next time the fore-leg of the other side. When it meets with a stone which it cannot remove, it deserts the excavation, and begins another. The pit, when completed, is usually about thirty inches in diameter by twenty in depth.

ANTOMMARCHI, FRANCESCO, a well-known physician and native of Corsica, was born in the second half of the 18th c. He owes his celebrity almost entirely to his intimacy with Napoleon Bonaparte during the exile of the latter in St. Helena. In 1818, he was induced to leave Florence, where he held the office of anatomical dissector in the Hospital of Santa Maria Nuova of Florence, and to become private physician to the banished emperor. There was at first little cordiality between the two; but subsequently Bonaparte conceived a high regard for his countryman, and at his death left him 100,000 francs. In 1821, A. returned to Europe, and in 1826 published at Paris *Les Derniers Moments de Napoleon*, a work which has been very extensively read. He now became involved in a dispute with the heirs of Mascagni—his old anatomical professor—regarding certain anatomical plates which he announced as on the eve of publication. The heirs affirmed that A.'s lithographed drawings were mere copies from the plates of Mascagni, and the controversy went on briskly for some time, till Paris grew tired of it, when it gradually died away and was forgotten. On the breaking out of the Polish revolution, A. departed for Warsaw, where he received the appointment of general inspector of military hospitals. He soon returned to Paris where he published a cast of Napoleon's head, which he affirmed to have taken when the emperor was on his death-bed. This declaration again involved him in a hot dispute with the phrenologists, who were not satisfied with the conformation of the cranium, and therefore cast suspicions—some of them apparently not altogether ill founded—on the veracity of A.'s statements. Harassed by the attacks of his adversaries, and sick of further controversy, A., about 1836, resolved to emigrate to America. He died at San Antonio, in Cuba, on the 3d of April 1838.

ANTON ULRICH, second son of Duke Ferdinand Albert of Braunschweig-Wolfenbüttel (till 1735, Braunschweig-Bevern, the title by which the prince was first known in Russia), was born in 1714. When the Russian Empress Anna was looking out for an alliance for her niece, Anna Carlowna, Princess of Mecklenburg-Schwerin, the influence of Austria led her to choose A. U. Accordingly, he came to Russia in 1733, was appointed colonel of a cuirassier regiment, and placed in the receipt of a considerable pension. The marriage was, however, long delayed. The princess shewed a decided distaste for the insignificant character of the bridegroom-elect, and only married him to avoid a still more hated union with the son of Biron. The birth of the Prince Ivan took place in 1740, a year after the marriage. About the same time, the empress falling dangerously sick, appointed the infant prince her successor, and Biron regent. After her death, A. U. made some feeble attempts to reverse this appointment, which only led to the punishment of those supposed to have instigated them, and to his own military degradation. Biron's conduct towards the parents of the infant prince becoming unbearably insolent, Anna appealed in despair to General Münnich, who put a sudden end to Biron's sway, and declared the grand-duchess and her husband regents. After a few months, Anna ungratefully overthrew Münnich. After his fall, as little unity prevailed between the ministers at the helm as between herself and her husband, and the government was looked upon as both a foreign and a contemptible one. Then came the revolution of the 5th December 1741, which in one night raised Elizabeth (q. v.) to the throne. A. U. and his consort were exiled, and lived long at Cholmogory, in the government of Archangel. Three children were born to them in exile. Anna died in 1746. Catharine II. offered A. U. his freedom, but he declined it. Ultimately, he grew blind. The exact year of his death is uncertain, but it is supposed to have taken place about 1780. Catharine offered to his children an asylum in Jutland, where they all died in comfortable circumstances.

ANTONE LLI, a Roman cardinal and secretary of state, descended from a family of bad reputation, of which several members had been notorious as robbers or *banditti*. A. was made a cardinal shortly before the succession of Pope Pius IX., by whom he was appointed Under-secretary of State for the Interior, and also Minister of Finance. In these offices, he gained the confidence of the pope, and though removed from office by the influence of the liberal party, who would not tolerate a priestly policy, he continued to be his constant adviser in all the troubles which followed the assassination of Rossi. After the flight of the pope to Gaeta, he was appointed his Chief Secretary, and has since held the helm at St. Peter's. A. is said to be less besotted in his admiration of despotism than several of his colleagues, but is accused of fierce rapacity. It is alleged that, conscious of the perils which environ the papal chair, and of its inability long to withstand the opposition of the intellect, morality, and enthusiasm of the *national*, as well as the *constitutional* party, he is secretly hoarding up immense sums, and lavishing lucrative offices on his relations.

ANTONE LLO, (of Messina), a painter who holds a prominent position in the history of Italian art, was born probably about 1414, in Sicily. In his day, the paintings of Johann van Eyck (of Flanders) enjoyed a wide celebrity, and several specimens were brought to Naples, where A. saw one of them. Admiring the new style of oil-painting, he travelled into Flanders and learned the secrets of the art from Van Eyck. Afterwards, he settled in Venice, and

was the first Italian who painted in oil-colours, in which he gave instructions to many artists. He died probably in 1493. His works are now rather scarce. One, in the Museum at Berlin, bears the date 1445.

ANTONINUS, MARCUS AURELIUS, the son of Annius Verus and Domitia Calvilla, was born at Rome on the 20th of April 121 A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who used to term him, not *Verus*, but *Verissimus*, and who conferred high honours on him, even while a child. When only seventeen years of age, he was adopted, along with Lucius C. Commodus, by Antoninus Pius, the successor of Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D. he was made consul; and from this period to the death of Pius in 161 A.D. he continued to discharge the duties of his various offices with the greatest promptitude and fidelity. The relation which subsisted between him and the emperor was of the warmest and most familiar kind. On his accession to the throne, he strikingly illustrated the magnanimity of his character, by voluntarily sharing the government (which Pius had left in his last moments, and the Senate offered to him *alone*) with young Commodus, who henceforth bore the name of Lucius Aurelius Verus, and to whom he gave his daughter Lucilla in marriage. Towards the close of 161 A.D., the Parthian War broke out, and Lucius, a young man of vigorous bodily habits, was sent to the frontiers of the empire, to repel the incursions of the barbarians; but intoxicated with the enervating pleasures of the East, he obstinately refused to go beyond Antioch, and intrusted the command of the army to his lieutenant Cassius, who gained several brilliant victories. Lucius returned to Rome (166 A.D.), and enjoyed a triumph to which he had no real claim; for all the great achievements of the war were accomplished by his officers, while he was revelling in the most extravagant licentiousness. In the meantime, Marcus Aurelius had distinguished himself by the prudence and energy with which he administered affairs at home. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself raged a pestilence, believed to have been brought home by the troops of Lucius; frightful inundations and earthquakes had laid large portions of the city in ruins, destroyed the granaries in which were kept the supplies of corn, and thus created almost universal distress, which stimulated to an incalculable degree the terror which the citizens entertained of their savage enemies. To allay the popular perturbation, Marcus resolved to go forth to the war himself. Hecatombs were offered to the offended gods, and the Roman legions set out for the north. Marcus and Lucius were, for the time, completely successful. The pride of the Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, was humbled, and they were compelled to sue for peace in 168 A.D.; in the year after which Lucius died. The contest was renewed in 170 A.D., and may be said to have continued with little intermission during the whole life of the emperor. Although fond of peace, both from natural disposition and philosophic culture, he displayed the sternest vigour in suppressing the revolts of the barbarians; but in order to accomplish this, he had to enrol amongst his soldiery vast numbers of gladiators and slaves,

for his army had been thinned by the ravages of the plague. His head-quarters were Pannonia, out of which he drove the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The same fate befell the Jazyges; but the most famous as well as the most extraordinary of all his victories, was the miraculous one gained over the Quadi (174 A.D.), and which gave rise to copious discussion amongst Christian historians and others. Dion Cassius's account is, that the Romans were perishing of thirst in the heat of summer, when suddenly the cloudless sky darkened, and abundant showers fell, of which the soldiers were taking advantage when the barbarians attacked, and would have cut them to pieces, if a storm of hail and fire had not descended on the former. That some extraordinary phenomenon occurred is evident, for there is a letter of Aurelius still extant in which he commemorates the event; and the emperor was a man incapable of uttering a falsehood, not to mention that there was an entire army living to disprove the statement, if untrue. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency; but the practical advantages that might have resulted from it were nullified by a new outbreak in the East, occasioned through the infamous treachery of his own wife, which demanded his presence; and though suffering from failing health, he was obliged to leave Pannonia. Before his departure, however, he learned that the ambitious governor, Avidius Cassius, who had rebelled against him, and seized the whole of Asia Minor, had perished by assassination. The conduct of Marcus Aurelius on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the Fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. Like Cæsar in similar circumstances, but in a more purely humane spirit, he received the head of his murdered adversary with quite opposite feelings to what had been anticipated, rejecting the bloody gift with all the loathing of a benevolent nature, and even shrinking from the presence of the murderers. On his arrival in the East, he exhibited the same illustrious magnanimity. He burned the papers of Cassius, without reading them, so that he might not be at liberty to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; disarmed the enmity, and dispelled the fears of the nobles who had openly favoured his insurgent lieutenant. While pursuing his work of restoring tranquillity, Faustina died in an obscure village at the foot of Mount Taurus; and her husband (and this was perhaps the single frailty of his character), though undoubtedly conscious of her glaring profligacy and infidelity, paid the most lavish honours to her memory.

On his way home, he visited Lower Egypt and Greece, displaying everywhere the noblest solicitude for the welfare of his vast empire, and drawing forth from his subjects, who were astonished at his goodness, sentiments of the profoundest admiration and regard. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew did the city of Jerusalem, he shewed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever laboured more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176 A.D., he reached Italy, and celebrated his merciful and bloodless triumph on the

23d of December. In the succeeding autumn, he departed for Germany, where fresh disturbances had broken out among the restless and volatile barbarians. He was again successful in several sanguinary engagements; but his originally weak constitution, shattered by perpetual anxiety and fatigue, at length sunk, and he died either at Vienna, or at Sirmium, on the 17th of March 180 A.D., after a reign of twenty years.

Marcus Aurelius A. was the flower of the stoical philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of heathen—we had almost said, Christian history, can shew. Perhaps, as a modern philosophic theologian suggests, it was because stoicism was the most solid and practical of the philosophic theories, and the one which most earnestly opposed itself to the rapidly increasing licentiousness of the time, that the chaste heart of the youth was drawn towards it. At twelve years of age, he avowed himself a follower of Zeno, Epictetus, &c. Stoics were his teachers—Diogenes, Apollonius, and Junius Rusticus; and he himself is to be considered one of the most thoughtful teachers of the school. Oratory he studied under Herodes Atticus and Cornelius Fronto. His love of learning was insatiable. Even after he had attained to the highest dignity of the state, he did not disdain to attend the school of Sextus of Chaeronea. Men of letters were his most intimate friends, and received the highest honours both when alive and dead. His range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. Nor must we forget that these were cultivated not merely in the spring time of his life, when enthusiasm was strong, and experience had not saddened his thoughts, and when study was his only labour, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an empire. The man who loved peace with his whole soul, died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained uncorrupted to the end of his noble life his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, every Roman citizen, and many others in distant portions of the empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship, and was believed to appear in dreams, like the saints of subsequent Christian ages.

There is one feature in his character, however, which it would be dishonest to pass over—his hostility, namely, to Christianity. He was a persecutor of the new religion, and it is clearly demonstrated, was cognizant, to a certain extent at least, of the atrocities perpetrated upon its followers. Numerous explanations have been offered of his conduct in this matter. The most popular one is, that he for once allowed himself to be led away by evil counsellors; but a deeper reason is to be found in that very earnestness with which he clung to the old heathen faith of his ancestors. He believed it to be true, and to be the parent of those philosophies which had sprung up out of the same soil: he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition, and a mysterious political conspiracy, was secretly spreading throughout the empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms. It was, therefore, comparatively easy, even for so humane a ruler, to imagine it his duty to extirpate this unnaturally hostile

sect. Mr. John Stuart Mill finds in this tragical error of the great emperor a most striking warning against the danger of interfering with the liberty of thought. What he says is so completely in harmony with the above conception of the motives of Marcus Aurelius, and is in itself so eloquent, that no apology is required in quoting the passage: 'If ever any one possessed of power had grounds for thinking himself the best and most enlightened among his contemporaries, it was the Emperor Marcus Aurelius. Absolute monarch of the whole civilised world, he preserved through life not only the most unblemished justice, but what was less to be expected from his stoical breeding, the tenderest heart. The few failings which are attributed to him were all on the side of indulgence; while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian, in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open unfettered intellect, and a character which led him, of himself, to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw, or thought he saw, that it was held together, and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces, and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion aimed openly at dissolving these ties: unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch, then, as the theology of Christianity did not appear to him true, or of Divine origin; inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable, could not be foreseen by him to be that renovating agency which, after all abatements, it has in fact proved to be; the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorised the persecution of Christianity. To my mind, this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire, under the auspices of Marcus Aurelius, instead of those of Constantine. But it would be equally unjust to him, and false to truth, to deny, that no one plea which can be urged for punishing Anti-Christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that atheism is false, and tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wise and better man than Marcus Aurelius—more deeply versed in the wisdom of his time—more elevated in his intellect above it—more earnest in his search for truth, or more single-minded in his devotion to it when found—let him abstain from that assumption of the joint infallibility of himself and the multitude which the great A. made with so unfortunate a result.'

ANTONINUS PIUS, TITUS AURELIUS FULVUS, a Roman emperor (138—161 A.D.), was born in the

reign of Domitian (86 A.D.). The family of A. was originally from Nemausus, now Nîmes, in Gaul. A. inherited great wealth, and early gave proof of excellent qualities. In 120 he was made consul; afterwards was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. By his wife Faustina he had four children, of whom three died, leaving a daughter, Faustina, afterwards wife of Marcus Aurelius. In 138 he was adopted by the Emperor Hadrian, in consequence of merit alone, and came to the throne in the same year. The reign of A. was proverbially peaceful and happy. In his private character, he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued during his reign, was partly stayed by his mild measures. He was little engaged in war, excepting in Britain, where he extended the power of Rome, and built a wall between the Forth and the Clyde, as a defence against invasions by the predatory inhabitants of the north; but he was frequently employed in arbitration and general counsel on the affairs of foreign states. 'Happy the nation which has no history.' The reign of A. illustrates this saying, for by the justice, wisdom, kindness, and courtesy of the emperor, his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the recording of which formed the largest part of the historian's work in the dark centuries of the Roman empire. It is said that only one senator was impeached during A.'s lifetime.

Copper Coin of Antoninus Pius, commemorative of his Victories in Britain, from one in the British Museum.

Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads, bridges, &c.; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet Pius was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonouring measures brought forward by the senate. A. died in 161 A.D. The column raised to his memory by his adopted son and successor, Marcus Aurelius Antoninus (q. v.), was discovered in 1709, and now exists only in fragments. The so-called Pillar of Antoninus, now in the Piazza Colonna at Rome, is that raised by the senate in honour of Marcus Aurelius, after his victory over the Marcomanni.

ANTONINUS, ITINERARY OF (*Antonini Itinerarium*), a valuable geographical work, containing the names of all the places and stations on the principal and cross roads of the Roman empire, with their distances from each other in Roman miles. It has been usually attributed to the Emperor M. Aurelius Antoninus, whence its name. The testimony, however, of the Greek geographer Ethicus, author of the *Cosmographia*, assures us that

a general survey of the Roman empire was commenced 44 B.C., in the consulship of Julius Cæsar and M. Antonius, and completed in the reign of Augustus, when the results of the survey received the sanction of the state. These results, it is with some probability inferred, are embodied in this *Itinerary*, which, it is further supposed, received additions and amendments in the time of the Antonines. Subsequent improvements were made down to the reign of Diocletian. The best editions are those of Wesseling (Amst. 4to, 1735), and Parthey (Berl., 1848).

ANTONINUS, WALL OF (*Antonini Vallum*), a barrier erected between the Firths of Forth and Clyde by the Romans, in the reign of Antoninus Pius, to restrain the encroachments of the native tribes. A fragment of a Roman pillar, which was at one time in the university of Edinburgh, fixes the date of its execution to 140 A.D. The superintendence of the work is generally attributed to the imperial legate Lollius Urbicus. Its length was about 27 English miles—the eastern termination being, according to two different suppositions, at Carriden, or at Kinniel, on the Forth; the western, at Old Kirkpatrick, or at Douglass Castle, on the Clyde. The work consisted of a ditch about 20 feet deep and 40 wide, a rampart of earth and stone about 20 feet high and 24 feet thick at the base, and on the inner or south side of the rampart a paved military road. It was protected by a chain of nineteen forts, with watch-towers between. The line of the wall may still be traced to a considerable extent. The most perfect fragments are at Elf Hill, on the moor of Bonnieside, about a mile and a half from Castlecary; within the park of Callander House, near Falkirk; and on the slopes at Inveravon, not far from the railway station at Polmont. It is commonly designated *Graham's Dike*—a name given also to more than one ancient ditch and rampart in England. The best accounts of the Wall of Antonine are in Roy's *Military Antiquities of the Romans in North Britain* (Lond., 1793), and in Stuart's *Caledonia Romana* (2d. ed., Edin., 1852).

ANTONIUS, MARCUS (MARK ANTONY), the Roman triumvir, born in 83 B.C., a descendant of one of the oldest patrician families, was the son of the Prætor M. Antonius Creticus, and, on the side of his mother Julia, was related to Julius Cæsar. His youth was wasted in dissipation, and finding himself pressed by numerous impatient creditors, he escaped to Greece in 58 B.C., where, for a short time, he listened to the teaching of Athenian philosophers and orators. His studies here were soon interrupted by the Proconsul Gabinius, who appointed him as leader of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, A. distinguished himself by his courage and activity, and ingratiated himself with the soldiers. After assisting Cæsar in Gaul, he went to Rome in 50 B.C., to advance the interests of the former, who stood in great danger from the hostility of the oligarchical party, and was appointed an augur, and chosen one of the tribunes of the people. In the following year, on account of his adherence to the party of Cæsar, he was expelled from the curia, and fled to Cæsar, who made use of this event as a pretext for his war against Pompey. At the outbreak of this war, A. received the appointment of commander-in-chief in Italy. In the battle of Pharsalia, he commanded the left wing of Cæsar's army. In 47, he was made master of the Horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself; got perpetually drunk; divorced his wife, and married an actress, with whom he paraded

offensively through the chief towns of the peninsula. In 44 B.C., he married Fulvia, the widow of Clodius; was made consul, and vainly endeavoured to prevail on the Romans to recognise Cæsar as emperor. After the assassination of Cæsar, he played the part so well described by Shakspeare; and by his funeral oration, and the well-timed display of Cæsar's bloody robe, so wrought on the passions of the people, that the conspirators were compelled to escape from Rome, leaving the successful orator for a while in possession of almost absolute power. Next, we find A. occupied in disputes and reconciliations with Octavianus (Cæsar's heir), besieging Mutina, and then denounced by Cicero as an enemy of the state. In 43 B.C., his troops were defeated at the battle of Mutina, when he escaped beyond the Alps; visited the camp of Lepidus, who commanded in Gaul; and gained the favour of the army, of which he took the command. Planens and Pollio joined him with their troops; and A., who so recently had escaped as a helpless fugitive from Italy, returned to Rome at the head of seventeen legions and 10,000 cavalry. Octavianus, who had pretended to maintain republican principles, now threw off the mask, and held a consultation with A. and Lepidus on the island of Reno (or Lavino), near Bologna, when it was determined that these triumviri should share the whole Roman world among themselves. To secure their spoil, they returned to Rome, and began their course of murder and robbery throughout Italy. Among their first victims fell Cicero, the orator whose eloquence they dreaded. According to Appian, not less than 300 senators and 2000 knights fell under the power of the triumviri. After making Italy safe for themselves, and raising an enormous sum of money to carry on their war abroad, A. and Octavianus led their troops into Macedonia against Brutus and Cassius, and defeated the republican forces. A. next paid a visit to Athens, and then went into Asia, to arrange his dispute with Cleopatra, queen of Egypt, whose conduct had offended the triumviri. The queen herself appeared to answer his challenge, and captivated A. by her beauty and address. The general who had overcome Brutus and Cassius was now made a prisoner, though not of war. He followed Cleopatra into Egypt, and lived with her in idleness and luxury, until he was aroused by tidings of the quarrel which had taken place in Italy between his own relatives and Octavianus. This dispute gave rise to a short war, which came to an end before A. arrived in Italy. A new division of the Roman world now took place between the triumviri, and was soon quietly arranged at Brundisium. A. took the East, and Octavianus took the West; while the ambition of the feeble Lepidus was appeased by his having the whole of Africa for his portion. Even this shadow of dominion was taken from him in 36 B.C. Meanwhile A. had confirmed his friendship with Octavianus by a marriage with Octavia, his sister. He now returned to Cleopatra, resumed his former voluptuous mode of life, squandered the wealth of Rome in gifts to his royal mistress, and became guilty of gross acts of injustice. Octavianus made use of these facts to excite the indignation of the Roman people against A. and a war between the rivals became unavoidable. A., in his idleness, tried to postpone the trial of strength which he saw inevitably approaching, and filled the island of Samos (where his troops were quartered) with musicians, jugglers, and buffoons. Meanwhile, at Rome, he was deposed from the triumvirate, and war was proclaimed against Cleopatra. Each party collected his forces, and in the naval engagement which took place (31 B.C.), near Actium (q. v.), A. was defeated. His subsequent hope

of finding troops still faithful to him in Libya was disappointed. He returned to Egypt, where, with Cleopatra, he once more forgot political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavianus at Alexandria. A. now roused himself, made a charge with his cavalry, and repelled the enemy; but the advantage was only momentary. Deserted by the Egyptian fleet, as by his own army, and suspecting that even Cleopatra had conspired against him, he went to her palace, from which the queen had escaped. Deceived by a false message informing him of the death of Cleopatra, A. committed suicide by falling upon his sword, in the year 30 B.C.

ANTONIUS or ANTONY OF PADUA, SAINT, was born at Lisbon, August 15, 1195, and, on the father's side, was related to Godfrey of Bouillon. He was first a monk of the Augustine order, and in 1221 became one of the most active propagators of the order of Franciscans. On his missionary voyage to Africa, being cast on the coast of Italy, he preached with great success at Montpellier, Toulouse, Bologna, and Padua, where he died, June 13, 1231. The legends of A. of P. are full of absurd fables. Among others, we are told that his eloquence as a preacher was so great that even the fish in the sea were deeply affected by it! His anniversary falls on June 13. His monument, a fine work of statuary, is in the church which bears his name at Padua.

ANTONY, SAINT, surnamed THE GREAT, and also ANTONY OF THEBES, the father of monachism, was born about the year 251 A.D., at Koma, near Heraklea, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having, in obedience to what he believed to be a divine injunction, sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic Church, and formed the model of the monastic life. When 30 years of age, however, desirous of obtaining a deeper repose than his situation afforded, he penetrated further into the desert, and took up his abode in an old ruin on the top of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305, he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded the monastery of Faioum, which at first was only a group of separate and scattered cells near Memphis and Arsinoë; but which, nevertheless, may be considered the origin of cenobite life. The persecution of the Christians by Maximian in 311 A.D., induced St. A. to leave his cell, and proceed to Alexandria, in the hope of obtaining the crown of martyrdom; but having failed in this, he returned to his solitude in the course of a year, which, however, he soon left, and plunged yet deeper into the desert. At length he found a lodgment on a hill, about a day's journey from the Red Sea; but his disciples discovering his retreat, so pressed him with their affectionate importunities, that he ventured to accompany them back. After many pious exhortations, he once more left them, and soon became the mighty oracle of the whole valley of the Nile. In 355, the venerable hermit, then 104 years of age, made a journey to Alexandria to dispute with the Arians. He had interviews with Athanasius and other distinguished persons; but feeling his end approaching, he retired to his desert home, where he died, 356 A.D.

Athanasius states, in his Life of St. A., that the saint wore only a coarse shirt of hair, and never washed his body, which is more credible than the stories he relates of his encounters with the devil, or

his miracles. His whole conduct indicates the predominance of a glowing and yet gloomy fancy, which is the proper condition of religious asceticism. Although the father of monachism, St. A. is not the author of any monastic 'rules'; those which the monks of the eastern schismatic sects attribute to him are the production of St. Basil. He is perhaps the most popular saint in the Catholic Church. Accounts of his life and miracles are given in the *Acta Sanctorum* of the Bollandists, under the date of the 17th January, on which day his festival was kept.

ST. ANTHONY'S FIRE.—The Rev. Alban Butler, in his *Lives of the Saints*, gives the following account of the origin of this name: 'In 1089, a pestilential erysipellatous distemper, called the *sacred fire*, swept off great numbers in most provinces of France; public prayers and processions were ordered against this scourge. At length, it pleased God to grant many miraculous cures of this dreadful distemper, to those who implored His mercy through the intercession of St. A., especially before his relics; the church [of La Motte St. Didier, near Vienne, in Dauphiné] in which they were deposited was resorted to by great numbers of pilgrims, and his patronage was implored over the whole kingdom against this disease.' The 'order of Canons Regular of St. Anthony,' a religious fraternity, founded about 1090, for the relief of persons afflicted with the fire of St. A., survived in France till 1790.

ST. ANTHONY'S WELL, a small fountain near the ruined chapel of St. A., on the northern slope of Arthur's Seat (q. v.), near Edinburgh. This interesting fountain, which consists only of a stone basin, into which water trickles from under an incumbent rock, is celebrated in the Scottish song—

'O, waly, waly.'

ANTRAIGUES, EMANUEL-LOUIS-HENRI DE LAUNAY, COUNT OF, a great politician, but very ambiguous character, was born at Vivarais, in the department Ardèche, in 1765, and was educated under the Abbé Maury. His superior talents were first displayed in his *Mémoire sur les Etats-généraux, leurs Droits et la Manière de les convoquer* (1788). This book, full of daring assertions of liberty, was one of the first sparks of the fire which afterwards rose to such height in the French Revolution. In 1789, when A. was chosen as a deputy, he not only defended the privileges of the hereditary aristocracy, but also ranked himself with those who opposed the union of the three estates; while in the discussions on the constitution, he maintained that the royal veto was an indispensable part of good government. After leaving the Assembly in 1790, he was employed in diplomacy at St. Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803 he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, entitled *A Fragment of the 18th Book of Polybius, discovered on Mount Athos*. He afterwards came to England, and acquired great influence with Canning. Despite his attachment to the interest of the Bourbons, he could never win the confidence of Louis XVIII. In 1812 he was murdered, with his wife, at his residence near London, by an Italian servant, who, immediately after the act, committed suicide.

ANTRIM, a maritime county in the north-east of Ireland, in the province of Ulster; bounded, N., by the Atlantic; W., by the north part of the river Bann, dividing it from Londonderry, and by Lough Neagh; S., by Lagan river, separating it from the county of Down; S.E., by Belfast Lough; and E. by the Irish Channel. It stands third among the Irish counties in population, but in extent only ninth. Its greatest length is 56 miles; its greatest

breadth, 20; its extent of sea-coast, 90 miles. Area, 1164 square miles. About two-thirds of this is arable; a fourth, barren; and a seventy-fourth in woods. Pop. in 1861, 247,414. Off the north coast lie Rathlin Isle and the Skerries; and off the east coast, the Maiden Rocks. The east coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch south-west a considerable way into the interior, forming a series of valleys, opening seaward, called the Glens of A. The interior of the country slopes towards Lough Neagh. The highest eminences are—Trostan, 1810 feet; and Slieveane, 1782 feet. The principal streams are—the Bann, running north from Lough Neagh into the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into Lough Neagh; and the Bush, flowing north into the Atlantic. Large and numerous peat-bogs occur in the county. Six-sevenths of the surface of A. consists of basaltic trap, often alternating with beds of red ochre, and overlying strata of hardened chalk, green-sand, new red sandstone, and mica-slate. The surface, and especially the edges towards the sea and Lough Neagh, of the trap-field, present basaltic columns of varied and impressive outlines. The green-sand and new red sandstone crop out along the east and south-east borders of A., and a patch of millstone grit occurs in the north-east corner. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' Causeway, on the north coast, near the mouth of the Bush, is one of the most perfect examples of columnar basalt in the world. Fine salt mines occur at Duncrue and Carrickfergus; and a small coal-field near Ballycastle. The soil of A. is mostly light, and the chief crop is oats. In 1858, 249,086 acres were under crop, two-fifths being in oats, one-fourth in potatoes, and one-fifteenth in wheat. The land is very much subdivided; and the rearing of flax, and the various branches of the linen, cotton, and coarse woollen manufacture, employ a great portion of the people, who unite mechanical and agricultural occupations with the best results. In 1851, A. had 339 National Schools, attended by 15,746 boys, and 13,017 girls. The principal towns are—Belfast, Lisburn, Ballymena, Carrickfergus, Larne, and Antrim. A. county returns two members to parliament; Belfast burgh, two; and Carrickfergus and Lisburn burghs, each one. The inhabitants are mostly Presbyterians, the county having been extensively colonised from England and Scotland between the reigns of Queen Elizabeth and William III. The original possessors were the O'Neills, who, in 1533, revolted against the English government, and regained the whole country, except Carrickfergus and part of the Glens—held by the Bissets of Glenarm, an Anglo-Norman family. It was reduced to allegiance during the reign of Elizabeth, when the forfeiture of Shane O'Neill terminated the dominion of his race.

ANTWERP (in French, ANVERS), formerly the chief city of a province in the Netherlands which was formed, in 1814, by a union of the old margravate of A. with the province of Mechlin, now the capital of the province which bears its name, and the chief commercial city of Belgium, is situated on the Scheldt, and contains 120,669 inhabitants. Its chief public institutions are—the Academy of Sciences, Academy of Painting and Sculpture, formerly known as the Academy of St. Mark, a Medical and Surgical School, Naval Arsenal, Museum, and Zoological Gardens. The cathedral, one of the noblest Gothic structures in Europe, is 500 feet in length by 240 in breadth, with a roof supported by 125 pillars, and a very lofty spire. The interior is enriched by the two greatest of all the pictures of

Rubens, the Elevation of, and the Descent from the Cross. The Church of St. James contains the monument of the Rubens family. The trade and manufactures of A. are considerable. The latter consist chiefly of sugar, white-lead, cotton goods, point-lace, linen thread, carpets, gold and silver lace, &c. It is still celebrated for its sewing-silk, black silk stuffs, and printers' ink, as it was in former times for its velvets, damask, and satins. The three annual fairs, formerly held at A., have lost all commercial importance, and are now represented by two popular festivals.

A. is mentioned as early as the 8th c.; in the 12th and 13th it gave signs of considerable prosperity, and, in 1550, numbered more than 200,000 inhabitants. The union of Belgium with Holland in 1815 was very favourable to the commerce and general prosperity of A. By the revolution of August 1830, it was linked to the destiny of Belgium. When the revolutionary party gained possession, the commandant, General Chasse, retreated to the citadel, and, exasperated by the breach of truce, commenced a bombardment, which destroyed the arsenal and about thirty houses. In 1832, a French army of 50,000 men, under Marshal Gérard, appeared before A., to demand the surrender of the citadel, which General Chasse refused. After considerable injury, and the loss of several lives among the citizens, General Chasse capitulated, Dec. 23, 1832. On the 30th of the same month, the Flemish fortification, and the forts Burght, Zwindrecht, and Austroeweel, were surrendered to the Belgian troops, and the Dutch troops were taken to France, as hostages for the surrender of the forts Lillo and Liefkenshoek, according to an article in the negotiation of Nov. 15, 1831, which stipulated that the five citadels held by the Dutch troops in Belgium should be surrendered. From these adversities A. has never fully recovered under the Belgian government. Its once considerable commerce with the colonies of Holland has gradually been transferred to Amsterdam and Rotterdam.

ANUBIS, an Egyptian deity, styled Anepu on hieroglyphic monuments, was, according to mythology, the son of Osiris and Nephthys. By the Greeks, he was frequently styled Hermes or Herm-anubis, combining the Egyptian with the Grecian name. He is represented on monuments as having the head of a jackal, with pointed ears and snout, which the Greeks frequently changed to those of a dog. Sometimes he is seen wearing a double crown. A white and yellow cock was sacrificed to him. His office, like that of Hermes Psychopompus among the Greeks, was to accompany the ghosts of the deceased into Hades (Amenthes), and there to assist Horus in weighing their actions, under the inspection of Osiris. As, in the time of the Romans, the Egyptian worship had spread beyond Egypt itself, the two conceptions of A. and Hermes were blent together, and the dog's head of the former was found united to the insignia of the latter.

Anubis.

ANVILLE, JEAN BAPTISTE BOURGIGNON D', a celebrated French geographer, born at Paris in 1697, died in 1782. He devoted his whole life to geographical science. Such was his natural taste for map-drawing, that his first study of the ancient authors induced him to publish, at the age of fifteen, a map of Greece. His rare qualities gained him the friendship of the Abbé de Songuerie, from whom he received those instructions which were the source of that profound and extensive knowledge he

subsequently acquired. He read the Greek and Latin historians and philosophers, as well as poets, specially noting the names and positions of cities and nations. He advanced the science of geography, not only by the vast number of maps which he executed, but also by the treatises, full of erudition and of historic and critical details, in which he discussed numerous interesting questions. The works of A. announced by M. de Maine many years ago, were to have been contained in six volumes, exclusive of the volumes of maps. The principal portion was published in 1834 by Levrault. But the death of M. de Maine in 1832 stopped the quarto edition near the end of the twelfth volume, to which the map of Africa was however wanting, although the text had been added, with notes digested from the most recent investigations in that country. A. has left 211 maps and plans, and 78 memoirs, the most of which are inserted in the *Recueil des Mémoires de l'Académie des Inscriptions et Belles-lettres*. His best map is that of Ancient Egypt. His *Orbis Veteribus Notus*, and *Orbis Romanus*, are also invaluable. The same remark applies to his maps of Gaul, Italy, and Greece, both ancient and medieval. His maps of modern countries contain all the knowledge attained in his time. His valuable collection of maps was purchased in 1779 by the French government for the Royal Library.

ANWARI, a celebrated Persian poet, who flourished during the 12th c., was born in the province of Khorassan, and educated at the college of Mansur, at Tus. He emerged from obscurity in the course of a night. The story goes that the Seljukide sultan, Sanjar, happened on one occasion to visit Tus, when the imagination of the youthful poet was so excited by the presence of the monarch and his glittering retinue, that he resolved to write a poem in his praise. By next morning, it was finished, and presented to Sanjar, who instantly placed the fortunate youth among his courtiers. A. now began to devote himself to astrology, which was his ruin; for having predicted that in 1185 or 1186 A.D. a hurricane would burst over all Asia, overthrow the most solid edifices, and shake the very mountains, and nothing of the sort really occurring, but, on the contrary, an entire year of remarkably tranquil weather, he fell into disgrace, and had to retire to Balkh, where he died in 1200—1201 A.D.

His poems consist chiefly of lengthy panegyrics, and shorter lyrical effusions. The latter (*ghazels*) are characterised by simplicity, ease, and naturalness; but the *kasidas*, or long poems, are disfigured, like many other eastern poems, by glittering imagery and historical conceits. His *Elegy on the Captivity of Sanjar taken Prisoner by the Ghurides*, has been translated into English by Captain Kirkpatrick in the 1st volume of *Asiatic Miscellanies* (Calcutta, 1785).

A'ORIST, a form of the Greek verb by which an action is expressed as taking place in an indefinite (Gr. *aoristos*) time. The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages—namely, the imperfect, perfect, and pluperfect—the A., which is peculiarly adapted to the narrative style of writing. The distinction of first and second A. is purely formal.

AORTA is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The A. in man is subdivided by anatomists into the Arch, the Thoracic A., and the Abdominal A. The arch is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the second piece of the breast-bone, and

then descending to the left side of the third dorsal vertebra. Five arteries arise from the arch—viz., two coronaries, for the supply of the muscular tissue of the heart itself; the innominate; and the left carotid and left subclavian arteries. At the commencement of the arch are three small swellings or

Aorta:

a, ascending arch of aorta; aa, coronary arteries; b', innominate artery; b, right subclavian; c, right carotid; d, left carotid; e, left subclavian; f, thoracic aorta; gg, diaphragm; hh, phrenic arteries; i, celiac axis; k, coronary or gastric; l, splenic; m, hepatic; n, superior mesenteric; oo, renal arteries; p, inferior mesenteric; p', spermatic; q, common iliac; r, middle sacral.

pouches, the aortic sinuses, below which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood back into the heart. The thoracic A. extends from the third dorsal vertebra to the diaphragm, gradually getting into the middle line of the spine. The thoracic A. gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (ten on left, and nine on right side). The abdominal A. passes from the diaphragm to the fourth lumbar vertebra, opposite the lower margin of which it divides into the two common iliac trunks. The abdominal A. gives off the two phrenic arteries to the diaphragm; the celiac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric for the small, and part of the large intestine; the renals (two); the supra-renal (two), one for each kidney; the spermatic; the inferior mesenteric, for the part of the large intestine not supplied by the superior mesenteric; and four or five lumbar arteries, which supply the lower part of the abdominal walls (the loins).

Where the A. bifurcates, a small artery, the *sacra-media*, or *caudal* artery, arises, and passes along in the middle line; in fish and in animals with large tails, this branch is a continuation of the A.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the A. will be given under ARTERY; and the comparative anatomy under HEART and CIRCULATION.

During foetal life, there is a communication between the arch of the A. and the pulmonary artery called the *ductus arteriosus*, the canal of which becomes obliterated after birth. It has been calculated that the velocity of the blood in the ascending part of the arch is $2\frac{1}{2}$ inches in a second. The pressure of the blood in the A. of a horse has been estimated to be 11 pounds; and in man's, 4 pounds 6 ounces.

The coats of the A. are very subject to fatty disease termed *Atheronia* (q. v.), and in advanced life, to calcareous degeneration or deposit of earthy particles, which destroys their elasticity. This change renders them very liable to *Aneurism* (q. v.), which, as may be expected, is generally situated at the curves of the A., especially at the arch. Sufferers from this disease in the arch or thoracic A., suffer from palpitation within the chest, difficulty of breathing, occurring in paroxysms and during sleep, and shoots of pain through the chest. If the aneurism is on the arch, it generally presses forward, and may completely destroy the breast-bone, forming a pulsating tumour, covered only by the skin, or it may press up into the neck. If low in the chest, the aneurism may compress the thoracic duct, and cause emaciation. In the abdomen, the symptoms are pulsation and pain; but in both situations aneurism may exist for a length of time without attracting attention.

In some cases, the A. has been found obliterated, shewing that the lower extremities can be supplied with blood by the anastomosing branches. Sir Astley Cooper and other surgeons have tied the A. for aneurism, but without success.

AOSTA, a northern province in the kingdom of Sardinia, surrounded by the highest elevations of the Alps, and watered by the river Dora-baltea. It contains an area of 1233 square miles. The dense pine-woods on the hills, the alpine pastures, on the slopes, the plantations of vines, almonds, olives, figs, and mulberry trees in the valleys, and the ores of silver, copper, and iron in the bosom of the mountains, supply occupation and means of subsistence to a population of about 81,000; but the land generally is not adapted to the growth of corn, though maize, barley, oats, &c., are produced in the lowest portions of the valleys. The disease styled *Cretinism* (q. v.) prevails to a lamentable extent, and few persons are altogether free from *Goitre* (q. v.). Great numbers of the poorer class emigrate during winter into the richer countries in their vicinity, and earn a livelihood as chimney-sweepers, masons, and smiths.—AOSTA, the principal town, 49 miles N.N.W. of Turin, contains 7500 inhabitants, and has a large trade in cheese, hemp, leather, &c. It was in ancient times the chief residence of the Salassi, a brave race of mountaineers, with whom Appius Claudius (134 B.C.) had to contend on his way into Gaul. They were finally destroyed by Terentius Varro in the time of Augustus. Monuments of the Roman times—a well-preserved arch, two gateways, the ruins of an amphitheatre, and a bridge—still remain. The celebrated baths and mines of St. Didier are in the neighbourhood. St. Bernard, the founder of the famous hospice which bears his name, was Archdeacon of A.; and Anselm, Archbishop of Canterbury, was born here.

APA'FI, MICHAEL I., Prince of Transylvania, was born in 1632, of an old but decayed family. He accompanied Prince George II. in an expedition against the Poles in 1656, but was taken prisoner at the irruption of the Tatar hordes under their khan, Mohammed Girai. After his release, he went and lived for a short time at his paternal estate; but in 1661 he was chosen Prince of Transylvania, at the instigation or desire of Ali Pasha, generalissimo of

the Turkish forces under Sultan Mahmoud IV. During the peace concluded with Austria, he reigned peaceably under the protection of the Porte, and acquired the towns of Clausenburg and Zathmar. He remained faithful to the Ottoman power till the siege of Vienna in 1683. Fortune then changed. The imperial troops penetrated into the country; and on the 12th of August 1687, A. made a treaty with the emperor at Harkany, by which Transylvania was declared to be freed 'for ever' from Turkish suzerainty, and placed under German protection. At Fogaras, on the 1st of July 1688, the Transylvanian deputies assembled at the national Diet, took the oath of fealty to the Hapsburgs as legitimate monarchs of Hungary. Ever since the death of his wife, Anna Bornemitz, in 1688, A. had been sorely afflicted both in body and mind, and died (April 15, 1690) on the eve of a fierce retributive war, commenced by his old allies the Turks, who considered themselves ill used by his desertion of them. His son, Michael II., succeeded to the throne and its perils. The Turks, under the vizier Cuprili, overthrew the imperial army, and took several places, such as Nissa, Widdin, Semendria, Belgrade, &c.; but the intestine troubles of the Ottoman empire hindered them, or rather Count Tekeli, the adventurer whom they were helping, from retaining these towns. The imperial troops subsequently regained everything; and at length the young Transylvanian prince was inveigled to Vienna, and cajoled into giving up his dominions to Austria in lieu of a pension of 12,000 or 15,000 florins. He died in 1713.

A'PANAGE is not an English legal term, but is a technical word in the French law, in which system it signifies the assignment or conveyance by the crown of lands and feudal rights to the princes of the royal family, that they may be enabled to maintain themselves according to their rank. (See a long article on this subject in Knight's *Political Dictionary*, which refers to Rotteck and Welcker, *Staats-Lexicon*, art. by P. A. Pfizer. See also Merlin's *Répertoire de Jurisprudence* under this head.) The word A., however, is sometimes found in Scotch law-books, the Scotch lawyers having most probably derived it from France, whose system of laws was so largely imported into Scotland—the Court of Session itself having been modelled after the plan of the Parliament of Paris. Mr. Erskine, in his *Principles of the Law of Scotland*, book i. tit. 4, sec. 8, says: 'The A., or patrimony of the Prince of Scotland, has been long erected into a regality jurisdiction, called the principality. It is personal to the king's eldest son, upon whose death or succession it returns to the crown. The prince has, or may have, his own chancery, from which his writs issue, and may have his own chamberlain and other officers, for receiving and managing his revenue;' and the late Professor Bell, in his *Principles of the Scotch Law*, calls this principality the prince's 'perpetual A. and personal provision.' In England, the duchy of Cornwall may be said to be an A. of the Prince of Wales, in whose person, also, since the junction of the two kingdoms under the same crown, now merge the rights of the Prince of Scotland. His royal highness, in fact, when he goes north, ought strictly to be called, not Prince of Wales, but Prince of Scotland.

In common parlance in England, the word A. is loosely used to denote any extra-territorial jurisdiction or sovereignty by governments or states; and even any dignity or right enjoyed by persons of rank.

A'PATITE is the scientific and commercial name applied to a mineral mainly consisting of phosphate

of lime (bone-earth), and which is in the course of being introduced into the agricultural market as a valuable material in the preparation of artificial manures. A. is found in many rock masses, but is especially disseminated in the igneous and older crystalline rocks, such as granite, basalt, and greenstone. The clay and soil formed naturally by the disintegration of these rocks, contain, of necessity, the A. in a fine state of division, and thus are enabled to supply plants growing thereon with one of the most important articles of the mineral diet of the members of the vegetable kingdom. The most extensive natural sources of A. are in Norway, where it is found largely in veins or fissures in the Syenitic rocks, and from which it is now mined on a large scale, by a British company, and transported to England; and in the island of Sombbrero, where the A. appears to compose the greater part of the island. Sombbrero is only one and a half miles long, by an average breadth of three quarters of a mile, and is situated amongst the West India Islands, about 60 miles from St. Thomas, and in lat. $18^{\circ} 35' N.$, and long. $68^{\circ} 28' W.$ Many cargoes of A. have already been abstracted from the island, and used, after being ground to powder, in the United States as a manure. Very large quantities are introduced into England under the name of Sombbrero Guano, and are extensively employed by the manufacturers of artificial manures, in place of ordinary bone-ash. The general treatment to which it is subjected is to reduce it to powder, and act upon the pulverised matter with sulphuric acid, which renders the phosphoric acid in the A. soluble in water, and thereby facilitates its introduction into the plant. In the greater number of cases where the A. or Sombbrero Guano is treated in this way, it is mixed with other manures, such as Peruvian Guano, blood, or true bones, and thus a complex substance is manufactured, which is much more acceptable to the plant than the simple A. or *mineral phosphate* itself. The A. from Norway, known in commerce as *Norwegian A.*, is also made up in a similar manner.

The great importance of mineral phosphate, in an agricultural point of view, arises from the fact that no mineral substance possesses more influence over the growth of the edible plants, such as wheat, barley, oats, turnips, &c., than phosphoric acid does; any cheap source of that substance, therefore, is a great boon. When the Norwegian A. was discovered in quantity, it was welcomed by the agricultural public, and immediately influenced the price of all manures. Phosphatic rock has within a very few years been imported from numerous islands in the West Indies and elsewhere. One of the most valuable deposits is that found in the Post-pliocene marls of South Carolina, and recently brought to the notice of the public by Dr. N. A. Pratt, of Charleston. The Ashley beds extend at an accessible depth over 1000 acres, and abound in nodules containing from 25 to 30 per cent. of phosphoric acid. The stratum of nodules appears also on the Stono, Edisto and Ashepoo R., and in heavy deposits near St. Helena sound. These beds may have originated from immense accumulations of animal remains upon a coral island, combined with the guano-like deposits of birds, reptiles and fish, which, subsequently depressed beneath the sea, have been broken up, rolled and transported to where they now appear. Vast quantities of the nodules are now converted into "superphosphate of lime" at Charleston, S. C., and at Camden, N. J. Upwards of 7000 tons of phosphatic guano from islands in the West Indies, and 5500 tons from the N. coast of S. America, were imported into the U. States in 1868. These deposits are invaluable aids in recuperating the soils of the Atlantic border depleted by exportation of exhaustive crops of wheat, corn, cotton and tobacco.

The different varieties of A. contain a little carbonate of lime, fluato of lime, muriate of lime, &c. One of these varieties is known as *Phosphorite*, another as *Morozite*, a third as *Asparagus Stone*. It occurs both massive and in crystals—which are generally small, and are often six-sided prisms, or six-sided tables—and is found in some of the tin mines in Cornwall, Saxony, Bohemia, &c., and in granite and gneiss in different parts both of Europe and America, sometimes forming beds associated with beds of limestone, as in Estremadura in Spain. It is found of various colours, more or less green, blue or red, sometimes white, and often gray. In St. Lawrence Co., N. Y., apatite occurs in very large crystals in white limestone; also in New Jersey near the Morris canal, and at Hurdstown, Sussex, Co., where it is mined in masses occasionally weighing 200 lbs. Coprolites, or fossil excrement of reptiles, also furnish a valuable supply of phosphoric acid, and occur in many fossiliferous rocks in England and Scotland.

APE, a name commonly given to the tailless monkeys. (See BARBARY APE, CHIMPANZEE, GIBBON, GORILLO, ORANG-OTANG, &c.) It was originally commensurate in signification with monkey, and the terms were indiscriminately used. The origin of the word is uncertain. See MONKEY.

The worship of apes or monkeys has been common among pagan nations from a period of remote antiquity, and still prevails very extensively, being practised in Japan, in India, and by some of the African tribes. The source of it is perhaps to be found partly in the doctrine of the transmigration of souls, and partly in the qualities which apes have been supposed to possess in a conspicuous degree, and of which they have been made symbolic. An A.'s tooth, kept in a temple in Ceylon, was regarded with extraordinary veneration, and immense wealth was accumulated through the continual offerings of the worshippers; but the temple was plundered, and the tooth carried away by the Portuguese in 1554.

A-PEAK, or A-PEEK, a maritime term signifying the position of an anchor when the cable has been drawn so tight as to bring the ship directly over it; the sailors then say that 'the anchor is a-peak.'

APELLES, the most celebrated painter in ancient times, was the son of Pythias, and was probably, in accordance with the statement of Suidas, born at Colophon, on the Ionian coast of Asia Minor; though Pliny and Ovid call him a Coan, and Strabo and Lucian an Ephesian. This, however, may simply refer to the fact that he was made a Burgess of that town. He flourished in the latter part of the 4th c. B.C., received his first instruction in art in the Ionian school of Ephesus, then studied under Pamphilus of Amphipolis, and latterly at Sicyon, under Melanthius, and thus he united the fine colouring of the Ionian with the accurate drawing of the Siccyonic school. During the time of Philip, A. visited Macedon, where he became the intimate friend of Alexander the Great. It was probably at the Macedonian court that the best days of A. were spent. Pliny relates that on one occasion when Alexander visited A. in his studio, the king exhibited such ignorance of art, that A. recommended him to be silent, as the boys who were grinding the colours were laughing at him. But the same story is told of Zeuxis and Megabyzus. He afterwards visited Rhodes (where he was familiar with Protogenes), Cos, Alexandria, and Ephesus. The period of his death is not known; but as he practised his art before the death of Philip, and as his visit to Alexandria was after the assumption of the regal title by Ptolemy, he probably flourished between 352 and 308 B. C. The most celebrated paintings of

A. were his Anadyomene, or Venus Rising from the Sea, with a shower of silver drops falling round her like a veil of gauze, the Graces, and similar subjects; but he cultivated the heroic as well as the graceful style. His ideal portrait of Alexander wielding a thunderbolt was highly esteemed, and preserved in the temple of Diana at Ephesus. With reference to this painting, Alexander said: 'There are only two Alexanders—the invincible son of Philip, and the inimitable Alexander of A.' A. is said to have left an incomplete painting of Venus, to which no other painter would presume to give the finishing-touches. The disposition of A. was remarkably free from envy, and he willingly acknowledged the merits of his contemporaries. Amphion, he said, excelled him in grouping, and Asclepiodorus in perspective, but *grace* was his alone. On coming to Rhodes, and finding that the works of Protogenes were not appreciated by his countrymen, he at once offered him fifty talents for a picture, and spread the report that he intended to sell it again as his own. The industry with which he practised drawing was so great as to give rise to the proverb, *Nulla dies sine linea*. Many other anecdotes are related of A. When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is said that A. instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to the shoes; or, in the Latin version, which has become proverbial, 'Ne sutor supra crepidam.'

A PENNINES (Ital. *Appennini*; anciently, Lat. *Mons Apenninus*), a mountain-chain extending uninterruptedly throughout the whole length of the Italian peninsula. It lies between 37° and 44° 30' N. lat., and 7° 40' and 18° 20' E. long., and belongs to the system of the Alps, from which it branches off at the Col de Tenda, near the sources of the Tanaro. From this point, the chain, under the name of the Ligurian A., girdles the Gulf of Genoa, in the immediate vicinity of the sea, and then runs inland to a considerable extent, forming the watershed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a south-western direction through Naples, dips under the sea at the Strait of Messina, and reappears on the northern coast of Sicily. Recent geographers divide the A. as follows: 1. *The North A.*, from the Col de Tenda in the Maritime Alps to the pass of Borgo San Sepolcro, in the neighbourhood of Arezzo, on the eastern border of Tuscany. 2. *The Central A.*, from Arezzo to the valley of the Pescara, which flows between the two Abruzzi. 3. *The South A.*, from the valley of the Pescara to Cape Spartivento. 4. *The Insular A.*, or the Sicilian range. The leading feature of the A., wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long terraced plateaus, lower ranges, and finally, extensive coast-plains, mark their gradual descent on the west. The general name for these lower ranges is *Sub-Apennine*; but they have a variety of particular designations, such as, the Mountains of Carrara and Seravezza, Pratomagno and Monte Amiata, in Tuscany; the Sabine, Alban, and Volscian mountains, in the Papal States; Monte Gargano on the south-east coast, north of Manfredonia, &c. The main chain of the A. does not send off spurs into the Apulian peninsula, or heel of Italy, which, for the most part, is rather level, or only interspersed with detached groups of hills.

The direction of the great chain of the A. is favourable to the formation, on the west side, of important river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while, on the east side, we find nothing but small streams, in most cases, destitute of affluents, hurrying down to the sea through wild precipitous valleys. In Northern Italy, the Ligurian A. almost overhanging the Gulf of Genoa, can only develop on the south puny streams, while the north sends down, through the plains of Piedmont, large tributaries to the Po.

The average height of the entire chain of the A. is about 4000 feet, which, however, in the north, sinks down to little more than 3500 feet; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range known under the name of Gran Sasso d'Italia, they reach an elevation of 10,200 feet, and in Monte Velino, of 7850 feet. The North A. attain, in Monte Cimone, situated in the south of Modena, a height of 6973 feet; the South A., in Monte Amara, a height of 9000 feet; the Insular A., if we exclude the isolated peak of Ætna—in Pizzo di Case, a height of 6500 feet.

The A. are crossed by thirteen principal passes; these are, proceeding from N. to S.—1, The Pass of Savona; 2, of Bocchetta; 3, of Cisa; 4, of Monte Cimone; 5, of Porretta; 6, of Pietramala; 7, of Borgo San Sepolcro; 8, of Furlo; 9, of Serravalle; 10, of Aquila; 11, of Isernia; 12, of Arcano and Troja; 13, of Potenza. The prevalent stone is a species of compact limestone, of a whitish-gray colour, belonging to the Jura formation. Resting on the limestone is found a more recent formation of sandstone and marl, which is especially abundant in the middle region of the Sub-A., contains an extraordinary number of petrifications, and must be reckoned as belonging to the upper division of the Parisian limestone. Older formations, however, frequently crop out. Thus, for instance, on the watershed of the North and Central A. there are found transition clay-slate, grauwacke-slate, &c. The A., especially the Roman and Neapolitan, are distinguished from all other mountain-chains by the rich variety of marbles which they contain. In some places, the quarries seem inexhaustible. Volcanic rocks are numerous in the middle and southern regions, where the agency of fire has caused very wonderful formations, as for instance, the crater-lakes of Albano, Nemi, Vesuvius, Solfatara.

The principal chain exhibits, for the most part, a dreary and barren appearance; it looks like a vast wall, with very few projecting peaks to break the dull monotony of the scene, and therefore seldom furnishes any salient points on which the eye of the spectator can rest with pleasure. Naked, riven, covered with thick *débris*, the declivities seem as if scorched by the southern sun. Only in the Abruzzi, in the Sub-A., and above all, in the marble mountains of Carrara and Seravezza, do the bold and magnificent forms of the Alps reappear. Where the A.—in general so poorly supplied with streams—exhibit a trace of Alpine abundance of water, there is no lack of rich pastures and dense forests, but usually only thin grass and wild scrubby bushes cover the stony slopes. The greater number of the roaring forest brooks, in the deep rocky ravines, display, during summer, only a dry bed. Where the mountains dip down to the sea, as at the Riviera of Genoa and the Gulf of Naples, a rich, peculiarly southern vegetation clothes the declivities. Gigantic agaves, Indian figs (*Cactus Opuntia*), myrtle-bushes, orange-groves, hint in these northern lands of the splendours of the tropics. Up to 3000 feet of elevation, cornfields, fruit-bearing chestnuts, and deciduous oaks are found. Beyond this, all vegetation often ceases

on the steep and stony sides of the mountains; but at other times the beech or the fir appears in dense forests. There is no region of perpetual snow; but the summits of the Abruzzi and the lofty peaks of Lunigiana, are often covered with snow from October far into May, and send their icy breath so suddenly down into the mild valleys, that the temperature in a few hours sinks 12° — 18° F., and a warm spring afternoon is succeeded by a bitter December evening.

APENRA'DE, a town in Northern Schleswig, situated at the bottom of a gulf in the Little Belt, has an excellent harbour, and a considerable amount of shipping. Long. $9^{\circ} 25' 12''$ E.; lat. $55^{\circ} 2' 46''$ N. Pop. 4100. The environs of the town are beautiful. The first historical mention made of A. relates to its destruction by the Slaves in 1148; and, indeed, its position has always laid it open to the casualties of northern war, whether on a large or small scale, as has been especially seen since 1848. Near the town stands the castle of Brundlund, built by Queen Margaret in 1411, in which the bailiff of the place resides.

APETALOUS, a term in Botany, applied to flowers or to flowering plants, and signifying that they are destitute of petals or corolla (q. v.). When both the calyx and corolla are wanting, the flower is said to be *achlamydeous* (from the Greek *chlamys*, a covering), or naked. The absence of the whorl of petals sometimes occurs in an exceptional manner in orders or genera ordinarily characterised by its presence. In some plants, as in certain species of the order *Caryophyllaceæ*, petals are sometimes present, sometimes absent, a tendency apparently existing to the suppression of this whorl.

APHELION, that point in the elliptical orbit of a planet which is most remote from the sun. The opposite point, or that nearest to the sun, is styled the PERIHELION. At the former point, the swiftness of the planet's motion is least, and begins to increase; at the latter, it is greatest, and begins to decrease. This irregularity of motion is most remarkable in comets whose orbits deviate most from the circle. The motion of the comet of 1680, at its perihelion, was calculated as 137,000 times more rapid than its motion in A. See APSIDES.

A'PHIS, a genus of insects belonging to the order Hemiptera, sub-order Homoptera—the type of a family called *Aphidii*. They are small insects,

to apple-trees, and when once it has found its way into a garden or orchard, is very difficult of removal. It is a minute insect, 'covered with a long cotton-like wool, transpiring from the pores of its body'—

Apple Aphis:
c, a branch with excrescences, reduced.

'a cottony excretion'—in which it differs from the ordinary aphides, and takes its place in the chinks and rugosities of the bark, multiplying rapidly, extracting the sap, causing diseased excrescences, and, ultimately, the destruction of the tree. It was first observed in England in 1787; but it is uncertain if it was, as has been supposed, accidentally imported from America. The Hop-fly (*A. Humuli*), and the A. of the turnip and cabbage (*A. Brassicæ*), have sometimes caused the destruction of entire crops. The price of hops varies from one year to another, very much according to the numbers in which 'the fly' has appeared. The potato A. (*A. vastator*) has been represented as the cause of the

Potato Aphis (*Aphis vastator*):
d, magnified fifty times.

Apple Aphis (*Eriosoma Mali*):

a, wingless insect, magnified: b, wingless insect in excrescence of the tree, magnified.

living by sucking the juices of plants, upon which they may be seen congregated in immense numbers, often doing serious injury, causing the distortion of leaves, and even the blight and decay of the plant. The woolly Aphis, or American Blight (*A. lanigera*; *Eriosoma Mali* of Leach), is sometimes very injurious

potato disease; but this opinion has few supporters. The aphides of the rose (*A. Roseæ*) and of the bean (*A. Fabæ*) are among the most familiarly known. Every one must have observed the leaves of trees and shrubs deformed by red convexities. In the hollows of the under side of these, aphides have their habitation, and there they find their food; the exhausted leaf at last curls up. Most of the species are green; the A. of the bean is black. They are generally called Plant-lice. They have a proboscis (*haustellum*), by which they pierce and suck plants; and at the extremity of the abdomen, two horn-like processes, from which exude frequent small drops of a saccharine fluid called *Honey-dew*, a favourite food of bees and ants. It has been seen even to fall in a kind of shower from trees much covered with aphides. Mention has been made in the article ANT, of the means which ants take to obtain this food. The legs of aphides are long, and they move slowly and awkwardly by them. The greater number of them never have wings; it is in the autumn that perfect winged insects generally appear. From the pairing of these result eggs, which produce female aphides in the following spring, and successive generations of wingless aphides are produced in a

viviparous manner without impregnation throughout the summer, the rapidity of multiplication being prodigious. Their increase, however, is restrained not only by birds, but by insects which feed on them. A family of coleopterous insects, to which the genus *Coccinella* or Lady-bird (q. v.) belongs, has received upon this account the name of *Aphidiphagi*, or aphid-eaters. There are also certain minute hymenopterous insects, which destroy them in great numbers by depositing their eggs in them; the larva feeds upon the living A., out of which it at last eats its way, leaving a mere desiccated skin.

APHORISM, a maxim, or any short and significant saying, such as, 'Custom is a second nature.' A whole piece or work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. In certain circumstances this aphoristic style has an impressive effect; but long continued, it becomes wearisome.

APHRODITÉ, the Greek name of Venus, according to various traditions, is derived from *aphros* (foam), in allusion to the old poetical myth which represented the goddess as springing from the foam of the sea. See VENUS and APOLLO. *Aphrodisia* were festivals celebrated in honour of A., in numerous cities of Greece, but especially in Cyprus. At Paphos, in this island, was her most ancient temple. Bloodless sacrifices alone were imagined to please A., such as flowers, incense, &c. Mysteries of an impure kind formed part of the ceremonial of the aphrodisia. Aphrodisia were no doubt held in the other places where A. was worshipped, such as Cythera, Sparta, Thebes, Elis, &c., though they are not mentioned. At Corinth and Athens, the aphrodisia were celebrated principally by prostitutes.

APIARY. See BEE.

APICIUS, a Roman epicurean—in the low and common sense of the word—lived in the times of Augustus and Tiberius, and was celebrated for his luxurious table and his acquirements in the science of cookery. When, in pursuit of his favourite study, he had consumed the greater part of his fortune, and had only some £80,000 left, he poisoned himself, in order to avoid the misery of plain diet. Two other gourmands—one in the time of Pompey, the other in the reign of Trajan—are mentioned under the name A. The Roman cookery-book, *Celii Apicii de Obsoniis et Condimentis, sive de re Culinaris* (libri decem), ascribed to A., obviously belongs to a much later time, inasmuch as it abounds in inaccuracies and solecisms. The unknown author has thought proper to recommend his work to gourmands by affixing to it the celebrated name of A.

A'PION, a Greek grammarian, was born at Oasis, a town in Libya, but educated in Alexandria, which he affected to consider his birthplace, from a desire of being thought a pure Greek. He studied under Apollonius, the son of Archibius, from whom he acquired an admiration of Homer, and afterwards went to Rome, where he succeeded Theon as teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge. He declared that himself, and every one whom he mentioned, would be held in immortal memory, that he was equal to the first philosophers of Greece, and that Alexandria should be proud of him. On account of his incessant bragging, Tiberius used to call him *Cymbalum Mundi* (the cymbal of the universe).

With the exception of one or two fragments, the whole of A.'s numerous writings are lost. He

composed a work on the text of Homer, partly in the form of a dictionary, which was frequently referred to by subsequent authors; a work on Egypt, which contained the far-famed story of *Androclus and the Lion*, preserved by Aulus Gellius; a work against the Jews; one in praise of Alexander the Great; another on the great epicurean Apicius; histories of various countries, &c.

A'PIOS TUBERO'SA, formerly included in the genus *Glycine*, and called *G. Apios*, a plant belonging to the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having tuberous roots, a twining stem, dark red flowers, leathery, 2-valvular legumes, and pinnate leaves, with seven pair of smooth ovato-lanceolate leaflets. This plant, which is a native of Virginia, has for a century been cultivated in botanic gardens in Europe, and has recently been brought into particular notice on the continent, in a great measure through the French traveller Lamare-Picquet, who, during his travels in North America, convinced himself of the value of the tubers as an article of food, for which they there are used to some extent. Various attempts have since been made to cultivate it like the potato; but its cultivation is found difficult, upon account of the length and weakness of the twining shoots and the length of the roots. The tubers cooked in steam are free from all acidity and bitterness, and very much resemble potatoes dressed in the same way. They contain more nitrogen than potatoes (4.5 per cent.), also more starchy farina (33.55 according to an analysis by Payen).

A'PIS, the bull worshipped by the ancient Egyptians, who regarded it as a symbol of Osiris, the god of the Nile, the husband of Isis, and the great divinity of Egypt. A sacred court or yard was set apart for the residence of A. in the temple of Ptah at Memphis, where a numerous retinue of priests waited upon him, and sacrifices of red oxen were offered to him. His movements, choice of places, and changes of appetite, were religiously regarded as oracles. It

Apis.—Golden Calf.

was an understood law that A. must not live longer than twenty-five years. When he attained this age, he was secretly put to death, and buried by the priests in a sacred well, the popular belief being that he cast himself into the water. If, however, he died a natural death, his body was solemnly interred in the temple of Serapis at Memphis, and bacchanalian festivals were held to celebrate the inauguration of a new bull as A. As soon as a suitable animal was found having the required marks—black colour with a white square on the brow; the figure of an eagle on the back, and a knot in the shape of a cantharus under the tongue—

he was led in triumphal procession to Nilopolis at the time of the new moon, where he remained forty days, waited upon by nude women, and was afterwards conveyed in a splendid vessel to Memphis. His Theophany, or day of discovery, and his birthday, were celebrated as high festivals of seven days' duration during the rise of the Nile. The worship of the golden calf by the Israelites in the wilderness, and also the employment of golden calves as symbols of the Deity by Jeroboam, have been very generally referred to the Egyptian worship of A.

A'PIUM. See CELERY.

APO'CALYPSE. See REVELATION, BOOK OF.

APOCALYPTIC NUMBER is 'the mystical number' 666, spoken of in the book of Revelation (xiii. 18). As early as the 2d c., the Church had found that the name, Antichrist, was indicated by the Greek characters expressive of this number, while others believed it to express a date. The most probable interpretation is that which was current in the days of Irenæus, and which found the number in the word *Lateinos* (*Latinus*). The Roman nation—the mightiest pagan power on earth—was the most terrible symbol of Antichrist, and the number 666 appears in the Greek characters which spell the name. Protestant controversialists very generally support their views by this interpretation, applying the prophecy to papal Rome.

APOCARPOUS FRUITS, in Botany, are those fruits which are the produce of a single flower, and are formed of only one carpel, or of a number of carpels remaining free and separate from each other. The term is derived from the Greek *apo*, implying separation, and *carpos*, fruit.

A POCO A POCO (Ital.) in Music, by degrees; by little and little.

APOCRENIC ACID is one of the products of the natural decay of wood and other plant textures, and is found wherever lignine or woody fibre is decomposing in soils, &c. As A. A. is soluble in water, it follows that rain-water falling on and percolating through soils containing this substance, becomes impregnated with it; and hence, in many natural waters, A. A. is a recognized constituent. A. A. performs an important function in the growth of plants, as there is every reason to believe that it forms one of the stages through which matter travels from dead plants again into the living vegetable tissue.

APO'CRYPHA, or APOCRYPHAL WRITINGS. The word originally meant *secret* or *concealed*, and was rendered current by the Jews of Alexandria. In the earliest churches, it was applied with very different significations to a variety of writings. Sometimes it was given to those whose authorship and original form were unknown; sometimes to writings containing a hidden meaning; or at other times to such as were objectionable; sometimes to those whose public use was not thought advisable. In this last signification, it has been customary, since the time of Jerome, to apply the term to a number of writings which the Septuagint had circulated amongst the Christians, and which were sometimes considered as an appendage to the Old Testament, and sometimes as a portion of it. The same name has been retained for them in Luther's translation of the Bible, where they are given as additions merely to the Old Testament.

The Christian Church has fluctuated in its acknowledgment and use of these writings. The Greek Church, at the council of Laodicea (360 A.D.), pronounced decidedly against them, excluding them from the canon; the Latin Church, on the

contrary, has always assigned them, at least since the council of Carthage (397 A.D.), a high place as worthy of reverence and esteem, without declaring them to be of equal authority with the other scriptures; which was first done by the council of Trent, although they had been in general use as part of the Sacred Scriptures long before. At the Reformation, the Protestants generally rejected them; but in some of the Protestant churches they soon began again to be read in public worship, although in some of them passages occur which decidedly favour Roman Catholic doctrines. The Church of England, in her Articles, enumerates the books of the A. as books which 'the church doth read for example of life and instruction of manners, but yet doth it not apply them to establish any doctrine.' Some portions of them are, therefore, included in the lessons of the church. By the other Protestant churches in Britain, as well as in America, they are completely rejected from public worship.

The controversy regarding the A., after slumbering for a long period, has been renewed in recent times both in Britain and in Germany. It arose in Britain very suddenly, about thirty years ago, in consequence of a discovery made by some of the most zealous supporters of the British and Foreign Bible Society, that the funds of that Society were in part expended in the circulation of the A. on the continent of Europe. This was defended on grounds of expediency, because the people of many parts of Europe had always been accustomed to see the A. in their Bibles, but was on the other hand denounced as contrary to the constitution of the society and to principle. Every question relative to the A. was opened up. Many members seceded from the British and Foreign Bible Society, and new Bible societies were formed. In this controversy, Mr. Robert Haldane and Dr. Andrew Thompson of Edinburgh, took a very prominent part as antagonists of the A. and of its circulation.

Impartially considered, these apocryphal writings, or at least a part of them, are not of very great importance. They have chiefly a historical value, throwing some light on the religious condition of the Jews, from the time when the old Testament ceases to be our guide, to the Christian era. They are distinguished into: 1st, Those which originated in Palestine, as *Jesus Son of Sirach*, valuable for its generally pure morality, written in Hebrew about 180 B.C., and translated into Greek about 130 B.C. *The First Book of Maccabees*, written about 135 B.C., which is of great historical value; and the valueless Book of *Judith*: 2d, Those which are of Egypto-Alexandrine origin, as the *Book of Wisdom*, the *Second of Maccabees*, and the addition to *Esther*: and 3d, those which bear traces of Chaldaic or Persian influence, as *Ezra*, *Tobias*, *Baruch*, and the addition to *Daniel*. *The Book of Wisdom* is the crown of the whole. In old editions of the Bible the A. is sometimes seen, being bound up between the Old and New Testaments. From the authorised editions in common use it is regularly excluded; and, except as a curiosity, it is little known to the generality of readers.

What is called the A. of the New Testament consists partly of histories, and partly of fragments of tradition, or of doctrinal teaching, belonging to the first three centuries, which have never claimed a place in the canon, nor been advanced by any one to that distinction even in the earliest times. They are of value chiefly to the historical critic. The most important among them are the pseudo-gospels; of these, a collection was made by Fabricius (Hamburg, 1719). A new edition of the *Codex Apocryphus, N. T.*, was commenced at Leipsic, 1832, by Thilo.

APOCYNACEÆ, or APOCYNEÆ, a natural order of Dicotyledonous plants, consisting of trees and shrubs, generally with milky juice, having entire leaves, and no stipules. The calyx is usually 5-partite, persistent; the corolla hypogynous, monopetalous, often with scales in its throat, regular, 5-lobed, twisted in bud. There are five stamens, which are inserted on the corolla; the anthers adhere firmly to the stigma, to which the pollen is immediately applied; the anthers are 2-celled, and open longitudinally; the pollen is granular. The ovaries are two, each 1-celled, or one, which is 2-celled; ovules usually numerous; styles 1 or 2; the stigma is contracted in the middle, and peculiarly characteristic of the order. The fruit is a follicle or capsule, or drupe or berry, double or single. The seeds have a fleshy or cartilaginous albumen, or (rarely) are ex-albuminous.—There are about 566 known species, chiefly natives of tropical countries. The *PERIWINKLE* (q. v.) is its only representative in the flora of Britain, a wanderer, as it were, from the tropics, yet hardy enough for the climate with which it has to contend; the *OLEANDER* (q. v.) and a few others are found in the south of Europe. Many species are poisonous; amongst which is the noted *TANGHIN* (q. v.) or *TANGHEENA* of Madagascar. Some are used in medicine, in India and other countries. A number of species yield *CAOUTCHOUC* (q. v.) The milk of others is bland and wholesome, as the *HYA HYA* or *COW-TREE* (q. v.) of Demerara. Some are used in dyeing; *Wrightia tinctoria* yields indigo of good quality.—A number yield eatable fruits, as *Willughbeia edulis* and *Carissa Carandas* in India; *Carissa edulis* in Arabia, and certain species of *Carpodinus*, called *PISHAMIN* in Sierra Leone, and *Hancornia*.—*Apocynum cannabinum*, Canadian hemp, a herbaceous plant about 4—5 feet in height, with unbranched stem, oblong leaves, and lateral cymes of whitish bell-shaped flowers, yields a very strong fibre, which the Indians of North America employ for making twine, cloth, fishing-nets, &c.

APODAL FISHES are fishes destitute of ventral fins. In the Linnaean system, the *Apodes* are an order of fishes, in which genera not otherwise nearly allied are brought together; but in the systems of Cuvier and other recent naturalists, a less important place is assigned to this distinctive character.—Eels are an example of A. fishes.

APODICTIC, a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No A. judgment can be founded on experience, because experience does not supply the idea of an absolute necessity.

A'POGEE (Gr. *apo*, from, and *ge*, the earth) properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's A. corresponding to the earth's aphelion, and the moon's A. being the point of its orbit most remote from the earth. A. is opposed to perigee.

APOLLINARIS, the Younger, Bishop of Laodicea in Syria (362), and one of the warmest opponents of Arianism. Both as a man and a scholar, he was held in the greatest reverence; and his writings were extensively read in his own day. His father, A. the Elder, who was presbyter of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavored to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions, after the manner of Homer, Pindar, and the

tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. It is not ascertained what share the father had in this work; but, as he had a reputation for poetry, he probably put the Old Testament into Greek verse. But it was chiefly as a controversial theologian, and as the founder of a sect, that A. is celebrated. He maintained the doctrine that the *logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualised and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread itself rapidly in Syria and the neighboring countries, and, after the death of A., divided itself into two sects—the Vitalians, named after Vitalis, Bishop of Antioch; and the Polemeans, who added to the doctrine of A. the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration. On this account, they were accused of *sarcolatria* (worship of the flesh) and *anthropolatria* (worship of man), and also were styled *synousiastoi* (*syn*, together, and *ousia*, substance), because they confused together the two distinct substances. The whole controversy, which occupied a great part of the 5th c., is an instance of human reason wandering out of its proper sphere. A. must not be confounded with Claudius A., Bishop of Hierapolis, in Phrygia (170 A. D.), and who wrote an *Apology* for the Christian faith, and several other works, all of which are lost.

APO'LLO (Gr. APOLLON). A. may be regarded as the characteristic divinity of the Greeks, inasmuch as he was the impersonation of Greek life in its most beautiful and natural forms, and the ideal representative of the Greek nation. His mild worship, with its many festivals, accompanied as they were by a cessation from all hostilities; his various shrines at sacred places, with their oracles, and the general idea of his character, had a wide, powerful, and beneficent influence on social and political life throughout the states of Greece. Homer and Hesiod mention that he was the son of Zeus and Leto, but neither states where he was born. The Ephesians believed that both he and Diana, his sister, were born in a grove near their city. The Tegyraens of Boeotia, and the inhabitants of Zoster in Attica, also claimed the honor of his birth; while the Egyptians seemed to think he properly belonged to them; but the most popular legend was that which made him a native of Delos, one of the Cyclades, where his mother Leto, followed by the jealous wrath of Juno over land and sea, at length found rest and shelter, and was delivered of him, under the shadow of an olive-tree, at the foot of Mount Cynthus. To spite the Queen of Heaven, who was far from being a favourite with the other goddesses, these hastened to tender their services to the weak and wearied Leto. The young A. was much made of. Themis fed him with nectar and ambrosia, the food of the gods, which seems to have suddenly excited the conceit of the infant deity, inasmuch as he surprised his nurse by starting to his feet, demanding a lyre, and announcing his intention of henceforth revealing to mortals the will of Jove. The island, proud of having been the birthplace of A., adorned itself with a robe of golden flowers.

In ancient literature A. is described as possessed of many and various powers, all of which, however, are seen on closer inspection to be intimately related to each other. He is spoken of: 1. The god of retributive justice, who, armed with bow and arrows, sends down his glittering shafts upon insolent offenders. In this character he appears in the

opening of the *Iliad*. 2. As the instructor of bards, and the god of song or minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. 3. As the god of prophetic inspiration, especially in his oracle at Delphi. 4. As the guardian deity of herds and flocks. 5. As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (*Æsculapius*), the god of the healing art. 6. As a founder of cities. According to Homer, he assisted Neptune in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated A. as their founder. By the latter

Apollo.

writers, A. was identified with Helios, the sun-god, though Homer describes the latter as a distinct deity. Several critics, however, have regarded Helios, or the sun-god, as the true original A.—an opinion which may be supported by many probabilities. The supposition that A. was identical with the Egyptian deity Horus was rejected by the learned O. Müller, who generally opposed all attempts to deduce Grecian from Egyptian mythology. According to Müller's theory, A. was a purely Doric deity, whose first residence was in Tempe, and who afterwards removed to Delphi, whence the fame of his oracle was spread abroad, and made him to be recognised as the national divinity of Greece. The introduction of his worship into Attica appears to have been contemporaneous with the immigration of the Ionians, and that worship would seem to have spread over the Peloponnesus, immediately after it was conquered by the Dorians. Much controversy has taken place, both with reference to the idea which lies at the root of the whole myth of the A. worship, and also as to whether this myth had its origin in the north of Greece or in Egypt. Even on the supposition that the original conception was derived from the latter source, it was to Greek art and philosophy that it owed its development into the ideal of humanity. The most celebrated oracles of A. were at Delphi, Abæ in Phocis, Ismenion in Thebes, Delos, Claros, near Colophon, and Patara in Lycia. Among the Romans, the worship of A. was practised as early as 430 B.C., and prevailed especially under the emperors. But there can be no doubt that the Romans derived their conceptions of A. entirely from the Greeks. It was in honour of A. and his sister Diana that the *ludi saculares* were celebrated every hundred years. The attributes of A. are the bow and quiver, the cithara and plectrum, the snake, shepherd's crook, tripod, laurel, raven, &c.; less frequently, the grasshopper, cock, hawk, wolf, and olive-tree. In sculpture, he is generally represented with a face beautifully oval, high forehead, flowing hair, and slender figure.

APO'LLO BELVEDE'RE, a celebrated statue of antiquity, which has generally been regarded as embodying the highest ideal of manly beauty. It is generally supposed to represent the 'lord of the unerring bow' in the moment of his victory over the Python, but numerous other explanations have been suggested. The figure (upwards of 7 feet in height) is naked, but a cloak fastened round the neck hangs gracefully over the extended left arm; the expression of the face is one of calm and godlike triumph, mixed with 'beautiful disdain.' This great work of art was discovered in 1503,

amid the ruins of the ancient Antium, now Capo d'Anzo, and purchased by Pope Julius II., who

Apollo Belvedere.

placed it in the Belvedere of the Vatican, whence the name it bears. The date of its execution is with probability referred to the reign of Nero, but the name of the artist is a matter of mere conjecture. The left hand and the right fore-arm, wanting in the statue as discovered, were restored, by G. A. da Montorsoli, a pupil of Michael Angelo.

APOLLODORUS, an Athenian painter, who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved colouring and distribution of light and shade.—A., a celebrated architect in the time of the Emperor Trajan, by whom he was employed to construct a bridge over the Danube in Lower Hungary. His severe censure, boldly pronounced on a design for a temple of Venus, which the Emperor Hadrian had sent to him, caused A. to be sentenced to death in 129 A.D.—A., a Greek grammarian, lived about 140 B.C., studied philosophy in Athens, and grammar under Aristarchus; wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The mythology, which begins with the origin of the gods, probably went down as far as the Trojan cycle, but a portion of it has perished. It has been reckoned by some only an extract from a larger work by A., though this is a mere hypothesis, based on the fact that the legends are given with extreme simplicity and brevity. The work is one of great value to classical scholars. An edition of the *Bibliotheca* of A., in 4 vols., was published at Göttingen, 1782—1783, by C. H. G. Heyne.

APOLLO'NIUS, the name of several celebrated Greek grammarians and rhetoricians. A., surnamed DYSCOLOS (or ill-tempered), of Alexandria, lived in the 2d c. Some of his grammatical works were edited by Bekker. A. was the first who reduced grammar to a system. His reputation was so high that Priscian calls him *grammaticorum princeps* (the prince of grammarians).—A., son of Archebulus, also of Alexandria, lived in the time of Augustus, and was the author of a lexicon of Homeric words.—A., surnamed Molon, was a teacher of rhetoric at Rhodes, and also gave lectures at Rome, where he was highly esteemed by Cicero and Caesar.—A. OF PERGA, 240 B.C., is classed with Euclid, Archimedes, and Diophantus, as one of the founders of the mathematical sciences. His work on conic sections has been preserved,

partly in the original Greek, partly in an Arabic translation.—A. OF RHODES (or of Alexandria, say some authorities), born 235 B.C., wrote many works on grammar, and an epic poem, entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. It was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated, not only in a wholesale manner by Valerius Flaccus, but even by Virgil in some passages. It has been edited by the German scholars Brunck and Wellauer (Leipsic, 1813—1828).

APOLLO'NIUS, OF TYANA, in Cappadocia, who lived in the time of Christ, was a zealous follower of the doctrines of Pythagoras. He soon collected a considerable number of disciples, travelled through a great part of Asia Minor, and endeavoured to find his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reached the Court of King Phraortes, in India, who recommended him to Jarchas, the principal Brahmin. When A. returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. From Rome he was expelled on a charge of having raised a young woman from the dead. After extensive travels in Spain, Italy, Greece, and Ethiopia, he was accused of having taken part in an insurrection against Domitian; but appeared before the tribunal, and was acquitted. Ultimately, he appears to have settled in Ephesus, where he opened a Pythagorean school, and continued his teaching until he died, nearly one hundred years old. His history was written about a hundred years after his death by Philostratus (q. v.). It contains a mass of absurdities and fables, through which an outline of historical facts and the real character of the man are sufficiently discernible. Hierocles, a heathen statesman and opponent of Christianity, wrote, in the 3d c., a work on the life and doctrines of A., with a view to prove their superiority to the doctrine of Christ. In modern times, the English freethinkers Blount and Lord Herbert, and Voltaire in France, have renewed the attempt.

APOLLO'NIUS, OF TYRE, the hero of a Greek romance, which enjoyed great popularity in the middle ages, and was translated into almost all the languages of Western Europe. In it are related the romantic adventures which befell A., a Syrian prince, previous to his marriage with the daughter of King Alcistrates, of Cyrene. To these are added the adventures of his wife, who was parted from him by apparent death, as well as those of his daughter, Tarsia, who was carried off by pirates, and sold in Mitylene. The poem closes with the reunion of the whole family. The original Greek work no longer exists; but there are three very early Latin versions, of which one was published by Welser (Augsburg, 1595); another is to be found in the *Gesta Romanorum*; and the third in the *Pantheon* of Gottfried of Viterbo. From this Latin source have proceeded the Spanish version of the 13th c., printed in Sanchez' *Collecion de Poesias Castellanas* (2d edition, Paris, 1842), several French versions, in prose and verse, as well as several Italian. As early as the 11th c. there was an Anglo-Saxon adaptation of the work, and subsequently various English ones appeared. Shakspeare has treated the subject in his

drama of *Pericles*; he substantially follows Gower, in his *Confessio Amantis*, who bases his narrative on the *Pantheon* of Gottfried of Viterbo. Three popular English stories, drawn from a French version of this romance, appeared in London in 1510, 1576, and 1607; while the Dutch, in 1493, derived theirs from the German. The romance was rendered into German, probably from the *Gesta Romanorum*, by a certain 'Heinrich von der Neuenstadt' (i. e., Vienna), about the year 1300, in the form of a long, and, as yet, unpublished poem. Later, we have a *Histori des Küniges Appolonii*, translated from Gottfried of Viterbo, and first published at Augsburg in 1476. Simrock, in his *Sources of Shakspeare*, narrates the story as it is given in the *Gesta Romanorum*. A modern Greek translation of the Latin romance, undertaken in 1500 by Gabriel Contianus, of Crete, and several times reprinted at Venice, must not be confounded with the lost Greek original.

A'POLOGUE, a fable, parable, or short story, intended to serve as a pleasant vehicle of some moral doctrine. One of the oldest and best apologies or parables is that by Jotham, as given in the Book of Judges (ix. 7—15). Another celebrated A. is that of the 'Limbs and the Body,' related by the patrician Menenius Agrippa. Æsop's fables have enjoyed a world-wide reputation. Luther held such an opinion of the value of the A. as a vehicle of moral truth, that he edited a revised Æsop, for which he wrote a characteristic preface. He says: 'In doing this, I have especially cared for young people, that they may receive instruction in a style suitable to their age, which is naturally fond of all kinds of fiction; and I have wished to gratify this natural taste without indulging anything that is bad.'

APO'LOGY. The term is now commonly understood as synonymous with an excuse for breach of an engagement, &c., but was originally used as the title of any work written in defence of certain doctrines, as in the *A. of Socrates*, ascribed to Plato and Xenophon; the *A. for the Christians*, by Tertullian, and in many other defences of the Christians written by Justin Martyr, Athenagoras, Tatian, Theophilus, Origen, Eusebius, Minucius Felix, Arnobius, Lactantius, Augustine, Orosius, and others. The attacks parried or retorted in these apologetical works are such as charges of atheism, want of philosophical knowledge, anti-social tenets, &c. Both the charges and the refutations brought forward serve to give us an insight into the character of the times when these works were written. Thus, in the A. by Tertullian, it is curious to find a formal argument employed to refute the assertion that the spread of Christianity was the cause of 'earthquakes,' and other natural phenomena which had occurred in some parts of the Roman empire. After the fourth century, when the church was made dominant under the Roman emperors, apologetical writings were less called for; but Bartholus Edessenus and Raymundus Martinus wrote against the Jews and the Mohammedans. In the 15th c., when the revival of learning placed Christianity in apparent opposition to the Platonic philosophy, Marsilius Ficinus wrote in defence of revelation; and some time after the Reformation, the spread of freethinking and scepticism in England was opposed by a variety of apologetical works, chiefly maintaining the points that Christianity is a divine revelation, Christ a divine messenger, and his church a divine institution. The defence of Christianity on grounds of reason came now to be treated as a distinct branch of theology, under the name of *Apologetics*. Among the numerous apologetical works by Protestants, may be mentioned those by Grotius (*De Veritate*, &c.), Butler (*Analogy of Religion, Natural and Revealed*),

Barclay (*Apology for The true Christian Divinity*), Addison, Soame, Jeynys (*Internal Evidences of the Christian Religion*), Hugh Farmer, Bishop Watson (*A. for Christianity*), Paley (*Evidences of Christianity and Horæ Pauline*), &c. Among Roman Catholic apologetic writers, the most eminent are Pascal, Hauteville, Guenée, Bergier, Mayr, and Chateaubriand.

Recently, in Germany, a great number of apologetic works by Neander, Tholuck, and others have appeared, in reply to the *Life of Jesus* by David Friedrich Strauss.

APONEUROSIS is an anatomical term for an expansion of strong fibrous tissue, of which there are many examples in the human body. For the sake of convenience it is generally confined to expansions from the tendons of muscles, as the lumbar A. If a tendon is very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered with a tendinous expansion, to which some of their fibres are attached; this is termed the aponeurotic *origin* of the muscle; it gives the muscle a more extensive attachment, without adding materially to weight. Aponeuroses stretch in some localities as protections over large arteries; thus, in bleeding from the vein nearest the inside of the bend of the elbow, the only structure between it, the lancet, and the brachial artery, is an aponeurotic expansion from the biceps tendon into the muscles of the fore-arm. See FASCIA.

APOPHTHEGM (Gr., an utterance), a term used to designate any truth or maxim sententiously expressed. The oracles of the heathen gods often took this form, as also the p̄verbs, memorable sayings, &c., of the sages of antiquity. In modern times, Lord Bacon has made a charming collection of apophthegms.

APOPLEXY is a term applied to an engorgement of blood, with or without extravasation, in or upon any organ, as the brain (*cerebral A.*), the spinal cord or lungs (*pulmonary A.*). As popularly used, the term denotes vaguely a condition arising from some disturbance within the head. A. occurs in *fits*, which may be sudden or come on by degrees. They are characterised by loss of sense and motion, speechlessness and heavy sleep, with stertorous respiration and a slow pulse. The fit may last from a few hours to two or three days, and passes off, leaving generally more or less paralysis, and recurs at intervals of months or years. The *age* at which A. occurs most commonly is from fifty to seventy, and is comparatively rare before and after these ages. Cerebral A. may arise from mere congestion of the blood-vessels of the brain, caused by impeded return of the venous blood, as from the military stock pressing on the jugular veins, keeping the head long in one position, or turning it quickly. Stout persons, with short necks, are more liable to this form of A.; thorough lean persons are also frequently its victims. But in addition to congestion, there may be an escape of the watery portion of the blood from the congested vessels, and this collecting, produces *serous A.*; or, owing to a diseased condition of the arterial walls, the vessels may burst, and A. from cerebral hemorrhage be the result; the latter is the most common, and is usually preceded by some softening of the brain substance itself. If this bleeding be to any great extent, death results; if only a small quantity escapes, it coagulates, and forms a clot, which is absorbed in time. Persons with diseased heart and lungs, and pregnant females, are liable to apoplectic fits. The attack is generally preceded by vertigo, headache, partial or temporary loss of

memory, and occasionally double vision. When these warnings occur, medical advice should be sought to correct the digestive functions; and by relieving the oppressed vein, ward off the fit. When the latter occurs, the patient's head should be raised, cold applied, and in some cases blood should be withdrawn from the temporal artery, or external jugular vein. As soon as possible, purgative medicines should be administered. For the results of A., see PARALYSIS. Tumours within the skull produce symptoms of A.

APOSTATE literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to renegade, or one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on speculative grounds (the Emperor Julian, for instance). After the 5th c., when heathenism was declining, many who had no sincere belief in Christianity, yet made profession of it, and were baptised: these also were styled apostates. The apostates in times of persecution were styled variously *Sacrificati*, *Thurificati*, &c., according to the modes in which they publicly made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. The Roman Catholic Church at one period imposed severe penalties on apostasy. The apostate was of course excommunicated; but sometimes also his property was confiscated, and he himself banished, or even put to death. It has often been of great moment to the fortunes of a nation that a prince has apostatised. The most renowned instance in modern history, is that of Henry IV. of France. In 1833 there was published, at Erlangen, *A Gallery of Important Persons who in the 16th, 17th, and 18th Centuries went over from the Protestant to the Roman Catholic Church*.—The term APOSTASY is now employed commonly, and often abusively, as a reproach for great or sudden changes in political opinions.

APOSTLE (Gr. *apostolos*, sent forth, sent on a mission), any messenger whatever, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew (called also Nathaniel), Thomas, Matthew (surnamed Levi), James (the son of Alphaeus), Thaddeus, Simon, and Judas Iscariot. Subsequently, Matthias was chosen in the room of Judas; and at a still later period, the number of the apostles was further increased by the calling of Paul to the apostleship. The term is sometimes used in the New Testament in its more general signification. Barnabas is styled an A. (Acts xiv.) It is a point of controversy between the supporters and opponents of episcopacy, whether or not the term A., as indicating an office, is applied to any except the original twelve, Matthias and Paul; it being maintained, on the one hand, that the office is perpetuated in bishops; on the other, that it was temporary and belonged exclusively to those who were witnesses of the resurrection of Christ, and were employed by him to found the Christian Church. The apostles were twice commissioned by their Master to go forth on their work of evangelization. First, during the third year of his public ministry. On this occasion, their labours were to be restricted to the Jews, properly so called. Not even the Samaritans, though natives of Palestine, were to be the objects of their religious solicitude. They were earnestly to seek out the lost sheep of the house of Israel. The second time was shortly before the Lord's ascension,

when their sphere of labour was indefinitely extended, 'Go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.' On the day of Pentecost the apostles received miraculous gifts, fitting them for their arduous work. And after evangelizing for some years in Palestine, they all departed, with the exception of St. James, into various quarters of the globe; but the region of their ministry seems to have principally comprised the civilized provinces and cities of the eastern part of the Roman empire—viz., Syria, Asia Minor, and Greece; though probably Peter, and after him Paul, visited Rome. There is no historical foundation for the tradition that the first apostles divided the then known world into twelve parts, each taking one of these for his special sphere of labour. This figment was very likely originated by two circumstances: 1. That the disciples were commanded to go into all the world and preach the gospel; and 2. That the disciples in point of fact had little personal intercourse with each other. Their zeal for the propagation of Christianity left them no time to gratify their social inclinations. As a consequence, we have very imperfect accounts of their lives or manner of death.

The several apostles are usually represented in mediæval pictures with special badges or attributes: St. Peter, with the keys; St. Paul, with a sword; St. Andrew, with a cross; St. James the Less, with a fuller's pole; St. John, with a cup and a winged serpent flying out of it; St. Bartholomew, with a knife; St. Philip with a long staff, whose upper end is formed into a cross; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias with a battle-axe; St. James the Greater, with a pilgrim's staff and a gourd-bottle; St. Simon, with a saw; and St. Jude, with a club.

APOSTLES' CREED. See CREED.

APOSTOLIC, or APOSTOLICAL, the general term applied to everything derived directly from, or bearing the character of the apostles. Either case constitutes apostolicity. The Roman Catholic Church declares itself the A. Church; the papal chair the A. chair, on the ground of an unbroken series of Roman bishops, from the chief apostle, Peter. The Church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be A.; so likewise do the Protestant Episcopal churches in Scotland and the United States. Apostolic Tradition (see TRADITION) claims to have been handed down from the apostles. In the same special sense, the name of A. Council belongs to that conclave of the apostles at Jerusalem (Acts xv.), about the year 51 or 52 A.D., occasioned by the disputes raised at Antioch by Judaizing Christians as to the admission of uncircumcised Gentiles into the church. Certain congregations or churches, also, which were the special scenes of the labours of the apostles, bore for centuries the title of A. Churches, more especially those of Jerusalem, Antioch, Ephesus, Corinth, and Rome. But with the ever-increasing spiritual power of the Romish hierarchy, the name A. came to be more and more exclusively applied to Rome, and is retained by her, despite the energetic protests of the Protestant Churches. Hence the term Apostolic See, i.e., the see of Rome; Apostolic Blessing, the blessing of the pope, as the successor of St. Peter; Apostolic Vicar, the cardinal who represents the pope in extraordinary missions; Apostolic Chamber, a council intrusted with the care of the revenues of the see of Rome; Apostolic Months—January, March, May, July, September, November—the months in which the pope, according to the Vienna Concordat of 1448, took possession of the vacant benefices in Germany,

&c. A papal brief or letter is styled A. in the same sense.

APOSTOLIC BRETHREN, or APOSTOLICI, the name given in Italy, towards the end of the 13th c., to one of those sects which, animated by the spirit of an Arnold of Brescia, felt constrained to oppose the worldly tendencies of the church. Its founder was Gerhard Segarelli, a weaver in Parma. Rejected, from some cause or other, by the Franciscan order, his long-continued and enthusiastic meditations led him to the profound conviction that it was above all things necessary to return to the simple forms of apostolic life. Accordingly, he went about (1260) in the garb of the apostles, as a preacher of repentance, and by his practical discourses gathered many adherents into a kind of free society, bound by no oaths. At first he managed to avoid any direct collision with the dogmas of the church; but after twenty years of undisturbed activity and growing influence, Segarelli was arrested by the Bishop of Parma; and in 1286, upon the occasion of his release, Pope Honorius IV. renewed a decree of Pope Gregory X. against all religious communities not directly sanctioned by the papal chair. In 1290, Nicholas IV. setting himself expressly to oppose the A. B., they, on their side, began avowedly to denounce the papacy, and its corrupt and worldly church, as the Babylon of the Apocalypse. In 1300, many, both men and women, and among them Segarelli, as having, after abjuration, relapsed into heresy, perished at the stake. But his cause survived him. Dolcino, a more energetic and cultivated man, brought up as a priest, who had previously taken an active part in the Tyrol against the corruptions of the church, now headed the orphan sect in Italy. He taught the duty of a complete renunciation of all worldly ties, of property and settled abode, &c. Having retreated into Dalmatia, he announced from thence the dawning of a new era, and in 1304, reappeared in Upper Italy, with thousands of adherents, as the enemy of the papacy—at that time humbled and impoverished by France. In 1305, a crusade was preached against him. He fortified the mountain Zebello, in the diocese of Vercelli, but was, after a gallant defence, compelled by famine to submit. After horrible tortures, which he bore with the utmost fortitude, he was burned. In Lombardy and the south of France, remnants of the A. B. lingered on till 1368. See Krone, *Fra Dolcino und die Patarerer*. (Leipsic, 1844.)

APOSTOLIC CATHOLIC CHURCH. See INVINGITES.

APOSTOLIC FATHERS, the name given to the immediate disciples and fellow-labourers of the apostles, and, in a more restricted sense, to those among them who have left writings behind them. The A. F., specially so called, are Barnabas, Clement of Rome, Ignatius of Antioch, and Polycarp of Smyrna. It is uncertain whether Papias of Hierapolis, and the author of the *Shepherd*, who gave himself out as the Heras spoken of in Rom. xvi. 14, were really disciples of the apostles. The writings of the A. F., as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them in spirit. Their main purpose is to exhort to faith and holiness before Christ's coming again. The writings of the A. F. have been brought within the reach of English readers by the translations of Archbishop Wake and Mr. Chevallier.

APOSTOLIC MAJESTY, a title held by the kings of Hungary, was conferred by Pope Sylvester II., in 1000 A.D., upon Duke Stephen of Hungary, who had not only much encouraged the progress of Christianity in Hungary, but actually preached

himself, in imitation of the apostles. In 1758, the title was renewed by Pope Clement XIII., in favour of Maria Theresa as Queen of Hungary, and continues to be used by the emperor of Austria as king of Hungary.

APOSTOLIC CANONS AND CONSTITUTIONS, both ascribed by tradition to Clemens Romanus, are notes of ecclesiastical customs held to be apostolical, written in the form of apostolic precepts. The *Constitutiones Apostolicæ*, consisting of eight books, were probably composed in Syria, and contain, in the first six books, a comprehensive rule for the whole of Christian life. These were probably written about the end of the 3d c.; while the seventh book, which is essentially an abridgment of them, may have belonged to the beginning of the 4th c. The eighth book was put together in the middle of the 4th c., for the use of the priests, and only relates to the sacred offices. Interpolations, however, were afterwards introduced. The *Canones Apostolici*, which were also recognised by the church, were composed at a later period. The first fifty, compiled in the middle of the 5th c., and translated from Greek into Latin by Dionysius the Younger, were acknowledged by the Latin Church alone. The Greek Church, on the other hand, accepted the thirty-five canons put forth in the beginning of the 6th c.; and this became a point of discord between the churches. Both collections were probably looked upon at first as apostolic tradition merely. Later, it came to be believed that they were written down by the apostles themselves, it being thought probable that they should have expressed themselves positively about the constitution as well as the dogmas of the church.

APOSTOLIC PARTY, the name given to a party who acted a conspicuous part in the modern history of Spain. They were composed of fanatical Catholics, who were also absolutists so far as the king consented to be their instrument. They formed themselves (soon after the revolution of 1819) into an A. P., whose leaders were fugitive priests, and whose troops were smugglers and robbers. After taking an active part in all the subsequent agitations, they finally merged (1830) in the Carlist party.

APOSTOLICAL SUCCESSION is a phrase used to denote one or both of two things—the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The former is necessarily a matter of fact, to be ascertained by history; the latter is rather a matter of opinion—the Roman and Protestant Churches, and again individuals and parties in either, differing widely from each other in their views. See **BISHOP AND ORDINATION**.

APOSTROPHE (Gr. *apostrophē*, a turning away, or breaking off) is a rhetorical figure by which a speaker changes the course of his speech, and addresses, with greater or lesser emotional emphasis, persons present or absent, the dead, or inanimate objects, either to invoke them as witnesses, or to pity, praise, or blame them. When the figure is well managed, it has a thrilling effect, both in oratory and poetry; but when extravagantly introduced, it becomes ludicrous. Examples of it abound in the writings and speeches of the great poets and statesmen both of ancient and modern times.—A. in grammar, is the omission of a letter or letters in a word, the omission being marked by a comma, as *'tis* for *it is*; the comma so employed is also called an A.

APOTHECARIES, in general acceptance, are skilled persons who keep shops or laboratories for the vending and compounding of medicines, and for the making up of medical prescriptions; but in

England, they may be not incorrectly described as an inferior branch of the medical profession. They are legally entitled to attend sick persons, and prescribe for them, as well as to make up and dispense medicines. It is not, however, usual for them to prescribe medicines to be prepared and supplied by others; and it may be doubted whether they can do so in London without incurring the penalties of the 14 and 15 Henry VIII. c. 5, by which the privileges of the London physicians are confirmed and extended—their ordinary practice, in addition to preparing medicines from a physician's prescription, being to advise the patient, to prescribe, and make up the required medicine in their own laboratory. But although an apothecary may attend sick persons, and prescribe for them, he cannot charge both for his attendances and his medicines, but must make his election between the two. It was so ruled by the late Chief-justice Best, in an action by an apothecary, who sought to recover on both grounds (see Wilcock on the *Medical Profession*, and the law-cases there collected). Although, therefore, the apothecary is inferior in professional rank and authority to the physician and surgeon, he is of a higher grade than the chemist and druggist, who merely vends drugs and medicinal compounds, but whose qualification, beyond the payment of a small annual tax by way of license, does not necessarily offer any test or guarantee of skill. Practically, however, although it may be matter of surprise and regret that the legislature has not interposed, by any stringent enactment, for the protection of the public against the unskilful and empirical druggist, little or no injury perhaps results from such a state of the law, for the rules of the 'Pharmaceutical Society of Great Britain,' incorporated in 1843 by royal charter, and the powers of which have been considerably enlarged by a recent statute, 15 and 16 Vict. c. 56, passed on the 30th June 1852, operate as a restraint on ignorance and want of skill. By a still more recent act called 'The Medical Act' (21 and 22 Vict. c. 90, s. 54), provision is made for the preparation of what the act calls 'the British Pharmacopœia,' an enactment which would be of value in the case of pharmaceutical malpractices, were it not that the next section of the same act expressly exempts from its operation, among others, the 'lawful trade or business of chemists or druggists,' an inconsistency of which perhaps poor persons, who cannot afford to consult a regular practitioner, have the chief right to complain. See **CHEMIST AND DRUGGIST**.

The business, or profession, as it may be called, of an apothecary in England, although neither regulated, nor, indeed, fully recognised, till modern times, has been made the subject of several ancient statutes, and is traceable to a remote period in the history of the healing art in England. Richard Fitznigel, who died Bishop of London, was stated to have been apothecary to Henry II.; and it is an accredited tradition, that in 1345 King Edward III. gave a pension of sixpence a day to Coursus de Gangland, an apothecary in London, for taking care of, and attending his majesty during his illness in Scotland. It is, however, improbable that A. were then common, indeed it may be doubted whether at that time they existed as a publicly known body at all, for, in 1511, there was passed an act of parliament, the 3 Henry VIII. c. 11, for regulating the admission of persons practising physic or surgery, but making no mention of the class now known as A. But in 1543, the parliament passed a very curious act, the 34 and 35 Henry VIII. c. 8, the preamble of which deals severely with the then ignorance and cupidity of the London surgeons; and as a remedy, it provides for the toleration and

protection of the irregular practitioners, who afterwards, as a body, acquired the distinctive name of A. This act, strange though it be in its language, may perhaps be regarded as the real foundation of the office of the modern apothecary. It certainly shews on its face sufficient cause for its recognition of the persons, to benefit whom it was passed, for it complains that the surgeons of London were not only unskilful and grasping, but that they 'have sued, troubled, and vexed dyers honest persons, as well men as women, whom God had endued with the knowledge of the nature, kind, and operation of certain herbs, roots, and waters, and the using and ministering of them to such as had been pained with custumable diseases, as women's breasts being sore, a pin and the web in the eye, uncomes of hands, burnings, scaldings, sore mouths, the stone, strangury, saucelim, and morpewh, and such other like diseases; and yet the said persons have not taken anything for their pains or cunning, but have ministered the same to poor people only for neighbourhood and God's sake, and of pity and charity.' The act, therefore, proceeds to ordain, 'That at all time from henceforth it shall be lawful to every person being the king's subject, having knowledge and experience of the nature of herbs, roots, and waters, or of the operation of the same, by speculation or practice, within any part of the realm of England, or within any other the king's dominions, to practise, use, and administer in and to any outward sore, uncome, wound, apostemation, outward swelling or disease, any herb or herbs, ointments, baths, pultess, and emplaisters, according to their cunning, experience, and knowledge in any of the diseases, sores, and maladies before said, and all other like to the same, or drinks for the stone, strangury, or agues, without suit, vexation, trouble, penalty, or loss of their goods, the foresaid statute in the foresaid third year of the king's most gracious reign, or any other act, ordinance, or statute to the contrary heretofore made in anywise notwithstanding.'

Anciently, the A. were not distinguishable from the grocers (the surgeons being, in like manner, undistinguishable from the barbers); indeed, it rather appears that A. and grocers were synonymous terms; and it was not till 1617, in the 13th year of James I., that these bodies were formed into two distinct corporations by a charter from the king, which, reciting a previous grant to the grocers in 1606, by which the two bodies were expressly united, declares that the A. shall, thenceforward, be separate from, and constitute a company distinct from the grocers. The privileges conferred by this charter upon the A. were afterwards considerably enlarged by an act of parliament, 55 Geo. III. c. 194, to which we shall presently refer. But even after the charter of James, the London A. appear to have been regarded merely as a trading company, occasionally prescribing the medicines which they sold, thus trespassing, as it was thought, on the province of the physician, until their right to do so was supported by a judgment of the House of Lords, in the case of the College of Physicians against Rose, reversing a previous decision of the Court of King's Bench. Rose, who was an apothecary and freeman of London, had attended one Seale, a butcher, and made up and administered what was not denied to be proper medicine to him. This, it was contended, on behalf of the physicians, was an infringement of their exclusive privileges, and the King's Bench being of the same opinion, unanimously gave judgment for the plaintiffs; but the judgment was reversed by the House of Lords. So generally established had this branch of the medical profession become, that, in 1815, the act of parliament, 55 Geo. III. c. 194, to which we have already

referred, was passed to provide for the sufficiency of their education; thus, for the first time, as it may be said, placing the A., as a body, on the footing of a liberal profession. This statute, which completely regulates the position, privileges, and responsibilities of the A., after reciting (and for the most part confirming) the charter of James I., by which the A. of London had been distinctively incorporated as a company, proceeds to enact that no person shall practise as an apothecary, or act as an assistant to an apothecary, in any part of England or Wales, unless he shall have been examined by a court of examiners (to be chosen by the master and wardens of the said company, in such manner as the act directs), and have received therefrom a certificate of his being duly qualified to practise as such. And with respect to what constitutes such practice as an apothecary, it has been judicially determined that courts of law will look to section 5 of the act, which defines certain of the duties and liabilities of the office, but which in noway deprives A. of any of their previously acquired privileges. The certificate—for which a sum is to be paid for the benefit of the company's funds—is not to be granted to any person below the age of twenty-one, or who has not served an apprenticeship of five years to an apothecary, and can produce testimonials of sufficient medical education and good moral conduct; and any person practising without such certificate, is disabled from recovering his charges, and for every such offence is, moreover, liable to a penalty of £20, which can be recovered in the county court. It is also provided that—inasmuch as it is the duty of every apothecary to prepare, with exactness, such medicines that may be directed for the sick by any physician lawfully licenced—any apothecary refusing to compound or sell, or negligently compounding or selling any medicines as directed by any prescription or order, signed by any physician, lawfully licensed, with his initials, shall incur such penalties and forfeitures as therein set forth. And further, that the master, wardens, and society of A. for the time being, or any persons by them appointed, and being not fewer than two, and properly qualified, may at all reasonable times in the daytime enter the shops of any A. throughout England and Wales, and search and examine whether the medicines and drugs be wholesome, and meet for the health of the subjects of the realm; and destroy such as they find to be otherwise; and report to the master and wardens of the society the names of the offenders, who are made liable to a fine of £5 for the first, £10 for the second, and £20 for the third offence. The act contains, however, a proviso that nothing therein shall affect the business of a chemist and druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicable compounds, wholesale and retail; nor interfere with the rights of the universities of Cambridge or Oxford, the College of Physicians or of Surgeons, or the Society of Apothecaries, respectively, except as altered by that act.

This act, which was passed on the 12th July 1815, provides for the exemption from its operation of such A. as may have been in practice on or before the first day of August of that year; a class, however, of whom it may reasonably be conjectured there are few now surviving. Still, it may without impropriety be asserted, that there are two classes of A. in England—first, the licentiates of the Apothecaries' Co., or, in other words, those qualified according to the provisions of the 55 Geo. III.; and second, a temporary class, namely, such A. as were in practice on the 1st day of August 1815.

The A. in Ireland are an exclusive corporation, whose privileges are expressly saved by the recent

medical act (the 21 and 22 Vict., c. 90). Although occupying a position corresponding in many respects to that of the same body in England, the Irish A. do not appear to have established their rights as medical practitioners to the extent to which the English A. have succeeded in carrying their pretensions, the privileges of the Irish A., under their charter, being limited to the vending, preparing, and administering drugs and medicines according to a physician's prescription, although they probably would incur no penalty by giving advice to patients in their own shops.

The existing law relating to A. in Ireland is contained in an act of the Irish parliament, the 31 Geo. III. c. 34, passed in 1791, and entitled 'An Act for the more effectually Preserving the health of his Majesty's Subjects, for erecting an Apothecaries' Hall in the City of Dublin, and regulating the Profession of an Apothecary throughout the Kingdom of Ireland.' The preamble—turning the tables on the English act, the 34 and 35 Henry III., which reflects so severely on the London surgeons—recites that 'whereas not only many but great inconveniences have arisen from the want of a hall amply supplied with medicines of the purest quality, prepared under the inspection of persons well skilled in the art and mystery of such preparations, but also frequent frauds and abuses having been imposed and practised on many of his majesty's subjects within the city of Dublin, and the liberties thereof, and in other parts of the kingdom of Ireland, by the ignorance and unskilfulness of divers persons pretending to the art and mystery of an apothecary, to the injury of the fair trader, the disappointment of the physician, and the imminent hazard of the lives of his majesty's faithful and loyal subjects throughout the realm.' The act proceeds to incorporate the A. as a company, and to erect their hall; the officers of the corporation being a governor, deputy-governor, and thirteen directors, elected from among the members, or any five or more of them, of whom the governor or deputy-governor should be one, shall be called a court of directors, for inspecting and directing all chemical and compound preparations and experiments. By section 18, no person, after the 24th June, 1791, shall be taken as an apprentice, foreman, or shopman to any apothecary in Ireland, until after examination by the company; and by the 22d section it is enacted that from and after the same date, 'no person shall open shop or act in the art or mystery of an apothecary, within the kingdom of Ireland, until such person shall have been examined as to his qualification and knowledge of the business, by such persons and in such manner as hereinbefore mentioned and required for the examination of persons applying to become apprentices or shopkeepers;' a provision that appears to give the Apothecaries' Hall in Ireland a complete monopoly in the vending and compounding of medicines.

In Scotland, there is no class of practitioners corresponding to the English A. The word apothecary does not appear, indeed, to be a generic term in the medical nomenclature of that country; the chemists and druggists, who are in general an extremely well educated and respectable class, do all the business connected with the making up of prescriptions, vending and preparing medicines; but they are not medical practitioners as in England, although many of them are surgeons.

APOTHECIA. See LICHEN.

APOTHEOSIS, deification, or the raising of a mortal to the rank of a god (*Gr. theos*). From the polytheistic point of view there is nothing monstrous in this idea; on the contrary, it is quite natural, and a necessary part of the system. Among heathens

generally, and especially among the Romans, every departed spirit became a deity (see MANES); and as it was common for children to worship (privately) the manes of their fathers, so was it natural for divine honours to be publicly paid to a deceased emperor, who was regarded as the parent of his country.' (See SMITH'S *Dictionary of Greek and Roman Antiquities*.) At the *Consecratio*, as it was called, of a Roman emperor, the body was burnt on a funeral pile, and as the fire ascended, an eagle was let loose to mount into the sky, carrying, as was believed, the soul of the emperor from earth to heaven. Many medals are found with the word *consecratio* surrounding an altar, with fire on it, and an eagle rising into the air.

APPALACH'CHIANS, the general appellation of the great mountain-system—called also the Alleghanies—which stretches from the interior of Maine to the borders of Alabama, its distance from the sea gradually ranging between about 100 miles in the north, and about 300 in the south. Speaking generally, this chain may be regarded as the parent of the Atlantic rivers of the United States on the one side, and on the other of the southern tributaries of the St. Lawrence, and of the eastern feeders of the Mississippi: it is not, however, the actual water-shed during its entire length, for it is crossed by the Connecticut, the Hudson, and the Delaware, just as the Himalayas are pierced by the Ganges, and the Andes by the Amazon. The chain, in fact, consists of several ranges generally parallel to each other, which, along with the intermediate valleys that occupy two-thirds of the breadth, form a belt 100 miles wide—its multiform character, however, developing itself only to the west and south of the Hudson. To take the chief ridges by name, and to begin from the north: the White Hills of New Hampshire present the loftiest elevations, Moosehillcock and Washington being respectively 4636 and 6634 feet above the sea. Next in order, the Green Mountains, which, true to the name, almost cover Vermont, attain, in Killington Peak, a height of 3924 feet; then come the Highlands, on the east of the Hudson, so striking an object to the voyagers on its waters; immediately beyond that river, again, we find the Catskill Mountains, which, though of inconsiderable length, contain two eminences—Round Top and High Peak—respectively of 3804 and 3718 feet; while, on a terrace of another member of the group, Mountain House, a favourite refuge from the heats of summer, is perched 2500 feet above the level of the Hudson. Proceeding onwards, the Kittatinnies extend from the north of New Jersey as far as Virginia; while nearer to the sea, the Blue Ridge, stretching from about the same parallel down to North Carolina, or rather below it, is crowned, within the limits of Virginia, by the Peaks of Otter, at an altitude somewhat greater than that of any point between themselves and New Hampshire. Lastly, there lie, more to the westward, the Alleghanies proper in Pennsylvania and Virginia, and the Cumberland Mountains on the east border of Kentucky and Tennessee.

Of all these elevations not one at all approaches the limit of perpetual snow. Yet France, while struggling with England in North America, regarded the A. as a wall that was physically to exclude her rival from the basins of the St. Lawrence and the Mississippi. Anglo-Saxon energy, however, has virtually levelled the supposed barrier from end to end. Through Maine, New Hampshire, and Vermont runs a railway from Portland to Canada; by canal or by railway, or even by both abreast, New York has reached the waters of the St. Lawrence on at least four principal points between Montreal in the east, and Buffalo in the west; Pennsylvania has carried to

Pittsburg a railway of 248 miles from Harrisburg, and a canal of 312 miles from Columbia; while, with the necessary exception of little Delaware alone, the remaining states along the coast have each its iron-way through the A.

The chain abounds in coal and iron, those gifts of nature to industrious man, which in all ages have done so much for civilisation, and which, in our own age, have, with the aid of steam, more than doubled all that they had done before; and it is a curious instance of the adaptation of the two worlds to each other, that, while the Spaniard met, in the south, the gigantic counterparts of the central plateau of his own romantic land, the Englishman, in the north, stumbled, as it were, on those same elements of almost creative energy which, within two centuries, were to be so instrumental in placing the daughter next to the mother among the nations of the earth. As an evidence of the actual value of the coal and iron of the A., Pennsylvania—where, hitherto, they have been chiefly found—has recently made more rapid strides than any other state of the Union, having, between the census of 1840 and that of 1850, outstripped in growth of population the previously more progressive states of Ohio and New York. Nor are iron and coal the only valuable products of the A. To say nothing of the valleys—many of them as fertile as they are lovely—which separate the parallel ranges from each other, the mountains themselves yield limestone, marble, slate, building-stone, copper, zinc, chrome, &c.

Geology.—During the Azoic and Palæozoic periods of the earth's geological history, the district now occupied by the A. was a level plain. These mountains date their origin from a period subsequent to the Carboniferous epoch. The Coal measures are the newest upturned beds associated with the Appalachian range; and as the stratified rocks, with few exceptions, are laid down horizontally, these strata must owe their inclined position to the dislocating agency which elevated the mountains; they, consequently, supply a date anterior to its activity. At the base of the A., on their eastern side, there are a series of red sandstone beds, unconformable to the upturned strata, and occupying the valleys in their original horizontality, thus evidently unaffected by the disrupting agency which must have been active prior to their deposition. These beds have been referred by geologists to different ages. That they are Old Red Sandstone, as conjectured by Maclure and others, is now universally denied. Hitchcock's supposition that they were Permian, is also considered as referring them to too remote a geological age. W. B. Rogers considered them first as members of the Triassic period; but has since, from evidence adduced from the contained organic remains, shown reason for relating them to the beginning of the Jurassic period. We thus obtain two grand limiting dates—the Carboniferous and Jurassic periods—within which the A. must have been formed. There are grounds for being even more specific, and referring the period of the dislocating agency to that immediately subsequent to the Carboniferous, represented in the stratified rocks of other districts by the Permian series; for the older upturned rocks had not only been ruptured and plicated, but also denuded into the various shapes they now present, before the horizontal rocks were deposited.

Professor H. D. Rogers has, after many years of persevering and devoted study, enunciated a theory of mountain formation based on his examination of the A., which not only explains their structure, but admits of a more or less complete application to the mountain systems of the world. The many proposed theories of mountain elevation are based upon assumptions which, unfortunately, are not true;

but that is an unimportant matter to the majority of our speculating geologists, and one never seen by the inventors of the theories, who allow themselves to be led captive by a poetic imagination, instead of building their inductions on field observations. Thus, to suppose that mountains are elevated by a wedge-like intrusion of melted matter, is to give to a fluid functions incompatible with its dynamic properties. So also the supposition that the igneous rocks were intruded as solid wedges, separating and lifting the crust, is opposed to the fact, that no apparent abrasion, but generally the closest adhesion, exists at the line of contact of the igneous and stratified rocks. Equally fatal objections can be adduced against the other theories. Professor Rogers observing that the A. were formed of a series of enormous waves, and comparing this appearance with other elevated districts, especially in Belgium and Britain, has enunciated a theory of their structure, of which the following is a condensed view.

Disturbed strata have a wave-like arrangement, their dip being in curved, and never in straight planes; and in extensive areas the varying angles of dip exhibit one or more wide regular curves. These undulations are in the form of long parallel waves, their parallelism being in the line of the general trend of the part of the mountain system to which they belong. When different grades of magnitude, as regards length, height, and amplitude, occur, the waves of the same grade are parallel, while the different grades are not necessarily so. The waves assume three different forms, which are characterised as—

Symmetrical flexures (a), equally steep on the two slopes; *normal flexures* (b), having an excess of incurvation on the one side compared with the other; and *folded flexures* (c), or those with a doubling under of their more incurved slopes, and among which the steepest slopes are generally directed to the same quarters. These three forms, representing different gradations in the flexure, are regular in their succession in disturbed regions, the order being the same as in the diagram—that is, when we start from the most disturbed side, we go from the folded waves to the normal ones, and from these to the symmetrical; and in the same order, the waves, as they recede from the folded side, become progressively wider apart and flatter. Resting on these facts, Professor Rogers has given his view of the structure of elevated regions in the following words: 'The wave-like structure of undulated belts of the earth's crust, is attributed to an actual pulsation in the fluid matter beneath the crust, propagated in the manner of great waves of translation from enormous ruptures occasioned by the tension of elastic matter. The forms of the waves, the close plication of the strata, and the permanent tracing of the flexures, are ascribed to the combination of an undulating and a tangential movement, accompanied by an injection of igneous veins and dikes into the rents occasioned by the bendings. This oscillation of the crust, producing an actual floating forward of the rocky part, has been, it is conceived, of the nature of that pulsation which attends all great earthquakes at the present day.'

This theory having originated as an explanation of the phenomena of the A., is easy of application to these mountains. They are composed of a series of

parallel waves, having a general direction similar to the coast-line of the Atlantic Ocean. The line of maximum disturbance is on their eastern limits; consequently, the folded flexures, with the inversion of their steep sides, are chiefly confined to the great Appalachian valley, and the Atlantic slopes south of it. The flexures of this type impart a prevailing south-east dip to the whole outcrop; their number, and the excessive difficulty of detecting and continuously tracing them, frustrates every attempt at mapping them individually. The flexures of the second type which curve more rapidly on the one side than on the other, prevail wherever the forces that disturbed the crust were neither excessively intense nor very feeble. It is the characteristic form everywhere between the great Appalachian valley and the Alleghany Mountains. It distinguishes not only those larger waves which separate the coal-containing strata east of the Susquehanna into special basins—but the minor undulations which throw the coal measures of these basins into groups of lesser saddles and troughs. Undulations of the first or symmetrical type occur beyond the Alleghany Mountains, where two groups of them may be distinguished; the one subdividing the bituminous coal-fields, with its five very broad waves, into six successive basins; the other, composed of four equidistant and very straight undulations, traversing parts of Cambria, Indiana, Somerset, and Fayette counties.

The strata thus elevated, and forming the A., belong entirely to the oldest or Palæozoic division of the fossiliferous rocks. Metamorphic rocks, consisting of felspathic, hornblendic, and micaceous gneiss, and mica-slate, exist on the eastern base of these mountains, but have not been noticed as forming part of the plicated strata of the A. Extensive formations of talcose and micaceous slates, indurated clay-slates, and chloritic and steatitic slates, exist in the more disturbed districts. These are highly metamorphosed members of the older fossiliferous, and must not be confounded with, though they so much resemble, the azoic metamorphic rocks.

The Palæozoic rocks constitute a vast succession of fossiliferous strata, commencing with the lowest deposits resting on the Metamorphic rocks, and terminating with the highest of the Coal strata. Their aggregate thickness, as measured in Pennsylvania, amounts to 35,000 feet. While exhibiting a remarkable variety of mineral character, they may be classed under the three great divisions of the sedimentary rocks—viz., sandstones, slates and limestones. Intercalated with them, as subordinate layers, there occur deposits of coal, chert, and iron ore. They are all more or less fossiliferous.

Coal Measures.—The character of the rocks of the Appalachian district of North America indicates that during the Carboniferous epoch an immense continent existed on the present site of the Atlantic, which supplied materials for the sandstone and slate. It seems to have had an extensive shallow marshy shore, of such a character as to be able to support the vegetation, which has become, in the course of ages, converted into coal. The coal-fields to the far west of the A., in Michigan, Indiana, Illinois, and Missouri, have been connected with the Appalachian coal formation, which includes all the detached basins, both anthracite and semi-bituminous, of the mountain-chain of Pennsylvania, Maryland, and Virginia, and also the vast bituminous trough lying to the north-west, in Pennsylvania, Ohio, Virginia, Kentucky, Tennessee, and Alabama.

On the eastern slope of the A., the coal, from its proximity to the region of greatest disturbance, has lost nearly all its volatile constituents, and is converted into hard shining anthracite (q. v.). In the

troughs to the westward of the great Appalachian valley, where the forces that disturbed the crust were not so intense, the coal has not parted with such a large proportion of volatile matter, but still is so much altered as to be characterised as semi-anthracite. Both the anthracite and semi-anthracite are extensively mined for economical purposes, but their extent as well as their value is of little importance compared with the enormous Appalachian bituminous coal-field. From Northern Pennsylvania to middle Alabama, its length is about 857 miles, and its greatest breadth between Southern Pennsylvania and Northern Ohio is about 180 miles; it covers an area of about 56,000 square miles, and is almost the largest expanse of coal measures in the world. A single coal-seam in this field has been traced over an extent of country 225 miles long by 100 broad, showing a superficial area of 14,000 square miles. The actual depth of workable seams in the deepest part of this basin is estimated at 40 feet; but when the amount of denudation of the upper measures over large districts is taken into account, the average depth of the entire field cannot be more than 25 feet. Taking this as the thickness, the amount of coal in this great coal-field would be 1,387,500,000,000 tons. When this is compared with the estimated quantity of coal in the British coal-fields, viz., 190,000,000,000 tons, some conception may be formed of the enormous extent of coal existing in this district of North America.

Metals.—Extensive beds of magnetic, hematitic and fossiliferous iron-ores occur in many of the formations of the A., from the lowest Metamorphic gneiss to the highest coal measures. This ore is extensively wrought in Pennsylvania and Ohio, large quantities of the anthracite being used in the smelting furnaces of the former state. Veins of lead occur in the Metamorphic rocks, rarely stretching up into the red slate. In the Palæozoic beds, veins of copper and nickel occur in sufficient quantity to be wrought.

APPALACHICOLA, a river of the United States, rising in Georgia, and flowing through Florida into the Gulf of Mexico, or rather into a bay that bears its own name. Reckoning from its remotest sources, the head waters of the Chatahooche, the A. is about 400 miles long, being navigable for boats throughout nearly its entire course. It is, however, only at the junction of the Chatahooche with the Flint that the name of A. is applied to the stream; and up to this point, a stretch of about 70 miles, there is a sufficient depth of water for steam-navigation; while the tides also ascend for about two-thirds of the distance.—A. is also a seaport at the mouth of the stream above mentioned. Here is shipped the produce of the river-basin, consisting chiefly of large quantities of cotton.

APPARENT. This term is used to express a number of important distinctions, especially in astronomy. The *A. magnitude* of a heavenly body is the angle formed by two lines drawn from the ends of its diameter to the spectator's eye; this obviously depends upon the distance of the body, as well as upon its real magnitude. A planet seen from the surface of the earth seems lower than if seen from the centre of the earth—the former is its *A. altitude*, the latter its real. *A. noon* is when the sun is on the meridian; true or mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator. See **EQUATION OF TIME**. The daily and annual motions of the sun in the heavens are both *A. motions*, caused by two real motions of the earth.

APPARITIONS. The belief that the spirits of the departed are occasionally presented to the sight of the living, has existed in all ages and countries, and usually declines only when a people have

advanced considerably in the knowledge of physical conditions and laws. Not that A. then cease to be reported—for this is far from being the case—but that the more intelligent part of the community are then usually able to explain away the alleged occurrence in some way satisfactory to themselves, not involving the admission of a possible projection of a spirit upon the living sense.

Nothing is more certain than that there are conditions of the body when spectral appearances, such as occur to us in uneasy dreams, become sensible to the waking vision. One of these conditions is that of the patient under the disease of *delirium tremens*, who not only hears ideal enemies plotting against his life in adjacent rooms or behind hedges, but thinks he sees them preparing to do him mischief, and has been known to jump overboard of a vessel into the sea, in order to escape the apprehended danger. In such excitements it is, though arising from different causes, that an intending murderer thinks he hears the prince of fallen angels tempting him on to crime, or sees before him a 'dagger of the mind' wherewith to end the life of his victim. There are also instances of spectral illusions traceable to a simply disordered state of the digestive organs. M. Nicolai, an eminent bookseller in Berlin, fell, in the early part of the year 1791, into a depression of spirits, and in that condition neglected a course of periodical bleeding which he had been accustomed to observe. The consequence was his becoming liable for some months to seeing trains of phantasmata or spectral figures, which moved and acted before him, nay, even spoke to, and addressed him. He was fortunately able, not merely to coolly observe the phenomena, but to describe them in an ample paper which he presented to the Philosophical Society of Berlin. This case may be said to have formed the basis of a theory of A., advanced by Dr. Ferrier, Dr. Hibbert, and others, amounting merely to this, that they are all to be accounted for by peculiar conditions of the organism of the individual sensible of them.

There is certainly a large class of cases which fall readily under this explanation: but, if we are to accept the whole that have been, on more or less good authority, reported, it must be admitted that a theory of a more comprehensive nature is still required in order to satisfy the duly cautious inquirer.

Let us take, for instance, an apparition story which Dr. Hibbert owns to be one of the best authenticated on record. It was thus written down in 1662 by the Bishop of Gloucester, from the recital of the young lady's father: 'Sir Charles Lee, by his first lady, had only one daughter, of which she died in childhood; and when she was dead, her sister, the Lady Everard, desired to have the education of the child; and she was by her very well educated, till she was marriageable, and a match was concluded for her with Sir William Perkins, but was then prevented in an extraordinary manner. Upon a Thursday night, she thinking she saw a light in her chamber after she was in bed, knocked for her maid, who presently came to her, and she asked why she left a candle burning in her chamber. The maid said she left none, and there was none but what she had brought with her at that time. Then she said it was the fire; but that, her maid told her, was quite out; and she said she believed it was only a dream; whereupon she said it might be so, and composed herself again to sleep. But about two of the clock she was awakened again, and saw the apparition of a little woman between her curtain and her pillow, who told her she was her mother, that she was happy, and that by twelve of the clock that day she should be with her. Whereupon she knocked again

for her maid, called for her clothes, and when she was dressed, went into her closet, and came not out again till nine, and then brought out with her a letter, sealed, to her father; brought it to her aunt, the Lady Everard, told her what had happened, and desired that as soon as she was dead, it might be sent to him. The lady thought she was suddenly fallen mad, and thereupon sent suddenly away to Chelmsford for a physician and surgeon, who both came immediately; but the physician could discern no indication of what the lady imagined, or of any indisposition of her body; notwithstanding the lady would needs have her let blood, which was done accordingly. And when the young woman had patiently let them do what they would with her, she desired that the chaplain might be called to read prayers; and when prayers were ended, she took her guitar and psalm-book, and sat down upon a chair without arms, and played and sung so melodiously and admirably, that her music-master, who was then there, admired at it. And near the stroke of twelve, she rose and sat herself down in a great chair with arms, and presently fetching a strong breathing or two, immediately expired, and was so suddenly cold, as was much wondered at by the physician and surgeon. She died at Waltham in Essex, three miles from Chelmsford, and the letter was sent to Sir Charles at his house in Warwickshire, but he was so afflicted with the death of his daughter, that he came not till she was buried; but when he came, he caused her to be taken up, and to be buried with her mother at Edmonton, as she desired in her letter.'

Dr. Hibbert, in treating of this case, concludes that the young lady was consumptive and about to die, and in this diseased frame of body became the subject of an illusion; but these are assumptions directly contrary to what the record bears, and there is, after all, the singular circumstance to be accounted for, that the young lady's death occurred exactly at the time predicted. To a similar purport is the case of the wife of Dr. Donne, related by Izaak Walton. Donne left his wife pregnant in London, and went with Sir Robert Drury to Paris. Two days after arriving there, he stated to Drury that he had had a vision of his wife, walking through his room with her hair hanging over her shoulders, and a dead child in her arms. So impressed were they by the incident that they immediately sent a messenger to London to inquire regarding Mrs. Donne's health. The intelligence brought by the man was, that she had been brought to bed of a dead child at the hour her husband thought he had seen her at Paris. In this case, too, if the requisite disordered state of Dr. Donne were granted, the coincidence of the distant event in its particulars, and in point of time, would remain unaccounted for by Dr. Hibbert's theory.

That there is an abundance of such cases reported, will not be disputed. In what direction speculation regarding them is to move, if the insufficiency of Dr. Hibbert's theory be acknowledged, will probably depend on the general tendency of the movements of science. If psychological study were more in repute, and the phenomena of dreaming in particular were diligently examined, there might be a hope of a satisfactory theory of what are called A. ere the world was many years older.

APPEAL, in the civic procedure of courts of justice, signifies the removal of a suit from one court or judge to another and higher court or judge, in order that the latter may examine the validity of the former's judgment, either affirming or reversing, altering or varying the judgment. A., however, is not a technical term in the procedure of the English and Irish common law courts, the judgments of these tribunals, as well as of other courts

regulated by the common law, being reviewed by a procedure which we shall presently explain. In England, the term *A.*, strictly and technically so called, is used in the business of the following courts:

1. In the Courts of *Equity* (or of Chancery), where there is an *A.* from the judgment of the Master of the Rolls, and from the Vice-chancellors to the Lord Chancellor himself, sitting alone, or concurrently with him, to the Lords Justices of *A.* in Chancery, or, if necessary, to the full court, consisting of the Lord Chancellor and of the two Lords Justices sitting together, and presided over by the former. The judgment of such Court of *A.* may then be itself appealed against to the House of Lords, whose determination is final.

2. In the Courts of *Bankruptcy*, the judgments of which may be appealed from now directly to the Court of *A.* in Chancery, and thereafter to the House of Lords, under certain restrictions.

3. In the Court of *Probate*, there is an *A.* to the House of Lords, with leave of the court. In the procedure of this tribunal there is also an *A.* from the county court, where such court has jurisdiction, to the Court of Probate itself, whose judgment is final.

4. In the Court of *Divorce and Matrimonial Causes*, the decision of the Judge Ordinary, sitting alone, may be appealed to the full court, whose judgment is final. But in the case of a decree dissolving a marriage, there may be an *A.* to the House of Lords.

5. In the Admiralty Courts there is an *A.* to the Privy-council; but when the Admiralty jurisdiction merges in that of the Court of Probate, under section 10 of the 20 and 21 Vict. c. 77, the course of *A.* will probably follow that prescribed for the latter tribunal, and the Lords will deprive the Privy-council of this appellate jurisdiction.

6. There is also an *A.* to the Privy-council from the following courts and matters: from the courts of India and from the colonial courts generally; and such *A.* includes the sentences, not only of courts of primary jurisdiction, but also of Courts of *A.* in the colonies; * from the Lord Chancellor in matters of lunacy or idiocy; in applications to prolong the term of patents for new inventions; and in making orders in certain cases relative to copyright, pursuant to the provisions of the copyright acts.

Practically, however, as we are told by Mr. Stephen in his Commentaries, all judicial authority of the Privy-council is now exercised by a *committee* of privy-councillors, called the Judicial Committee of the Privy-council; who hear the allegations and proofs, and make their report to Her Majesty in council, by whom the judgment is finally given.

In the practice of the common law courts of England—that is, the Court of Queen's Bench, the Court of Common Pleas, and the Court of Exchequer, or, as is put by Lord Coke, any court whose proceedings are regulated by the common law—the procedure by way of *A.* is, as we stated at the beginning of this article, technically not so called, but is said to be in *error*, the party complaining

of the judgment being called the plaintiff in error instead of appellant, and his opponent, the defendant in error, instead of respondent. Formerly, the proceedings commenced by suing out a writ of *erroi* first to a court of intermediate *A.*, called the Court of Exchequer Chamber, and afterwards by a further writ of error to the House of Lords. But by the common-law procedure act of 1852 (15 and 16 Vict. c. 76, s. 148), writs of error are abolished, and the mode of review regulated by legal forms which need not be here explained.

Error also lies to the Queen's Bench in criminal cases, when, *after judgment*, it is considered that the indictment is bad in substance, or that the judgment is erroneous, or in respect of any other substantial defect appearing on the face of the record. But now the usual and proper method of review in criminal cases is that prescribed by the 11 and 12 Vict. c. 78, constituting a new Court of *A.*, composed of the judges of the three common law courts, or of a quorum of five of them at least, of whom the three chiefs, or one of such chiefs at least, shall be part.

As to redress by way of *A.* and error against the judgments in the courts of Ireland, the procedure is so similar to that employed with respect to the English courts, that we need not here enter into particulars on the subject. We may simply remark, generally, that the Irish Chancellor, sitting alone, does not appear to exercise any appellate control over courts inferior to his own, such as that possessed by the Chancellor in England; for, according to the Irish practice, the *A.*, for instance, from the Master of the Rolls, and in the case of proceedings in bankruptcy, is not to the Chancellor himself alone, but to the Court of *A.* in Chancery, in which the Chancellor and a Lord Justice of *A.* are the appointed judges; and which Court of *A.* likewise reviews the Chancellor's own individual judgments. The judgments of this Court of *A.* itself, however, may afterwards be reviewed on *A.* by the House of Lords. In criminal procedure, the above act (11 and 12 Vict. c. 78) applies to Ireland as well as to England.

In the procedure of the Scotch courts, there are various appeals in the practice of the sheriff or county courts, and in the proceedings in bankruptcy; and the House of Lords reviews the judgments of the Court of Session, the supreme civil court of the country, and which tribunal, indeed, it may be said, supplies the House with the larger portion of its judicial business. This circumstance has frequently been remarked on as proving a litigious disposition on the part of the Scotch; but perhaps the greater number of Scotch appeals over English and Irish may be more fairly said to be occasioned by a natural feeling on the part of litigants and lawyers in Scotland, that there is a better chance of a nice and critical examination of the judgments appealed against by such judges as preside in the House of Lords, who are all lawyers of the greatest learning and eminence, and whose legal and judicial minds have been formed under a different and larger system of jurisprudence and procedure than prevails in Scotland, than there would be to a tribunal composed entirely, or for the most part, of Scotch lawyers. Indeed, it may be said, that although the judicial staff of the House of Lords are exclusively English lawyers, the system of *A.* to their lordships from the Scotch courts works extremely well, and gives entire satisfaction to the Scotch people. Some of the most valuable elucidations of the peculiar principles of Scotch law are to be found in the judgments in Scotch appeals by the chancellors and other law lords who, since the union with Scotland, have administered the jurisdiction of the House in the last resort, but who were never in a Scotch court, and, until called upon to discharge such responsible

* As to colonial causes, we are informed by Blackstone that the jurisdiction of the Privy-council is 'both original and appellate. Whenever a question arises between two provinces out of the realm, as concerning the extent of their charters and the like, the king in his council exercises *original* jurisdiction therein, upon the principles of feudal sovereignty. And so likewise, when any person claims an island or a province, in the nature of a feudal principality, by grant from the king or his ancestors, the determination of that right belongs to the king (or queen) in council, as was the case of the Earl of Derby, with regard to the Isle of Man, in the reign of Queen Elizabeth, and the Earl of Cardigan and others, as representatives of the Duke of Montague, with relation to the island of St. Vincent, in 1764.'

functions, had probably never opened a Scotch law-book.

There is no A. to the House of Lords from Scotland in criminal cases, nor does the above-mentioned act—11 and 12 Vict. cap. 78, creating a court of criminal A. for England and Ireland—extend to Scotland. But the High Court of Justiciary there, which is the supreme criminal tribunal, and is composed of seven judges of the Court of Session, presided over by the Lord Justice General, or Lord President, as he is otherwise called, reviews the procedure of all the criminal courts of the country (excepting where such jurisdiction is expressly excluded by statute); and it is believed that no inconvenience is experienced in consequence of there being no other or further A. from the sentences of these courts.

APPENZEL (from *Abbatia Cella*), a canton in the north-east of Switzerland. Area, 152 square miles. Pop., 60,431. It is divided into two districts—Innerrhoden and Auserrhoden, the former of which is peopled by Protestants, the latter by Roman Catholics, and noted for its dense population. The surface is mountainous, especially in the south, where Mont Sentis attains an elevation of 8232 feet. The chief river is the Sittren, which flows through the centre of the canton. A. holds the 13th place in the Swiss confederacy, and furnishes 972 soldiers to the national army. The inhabitants are chiefly employed in agriculture, cattle-keeping, cotton manufactures, and embroidery. They are fond of dancing, music, and athletic exercises, and have the reputation of being first-rate marksmen.

Appenzell, the capital of the canton of the same name, is situated on the left bank of the Sittren, in lat. 47° 29' N., and long. 9° 24' E. Pop., 3200. The town is ill built, and has only a small trade in linens. The other towns are Trogen (with a pop. of 2400), and manufactures of linen and muslin), Herisau, &c.

APPERLEY, CHARLES JAMES, the 'Nimrod' of the *Quarterly Review*, is a writer who deserves mention, if not from the intrinsic importance of the subjects on which he exercised his pen, at least from the perfection he attained in the department to which he confined himself. He was the son of a Welsh country gentleman, and was born in Denbighshire in 1777. His education at Rugby stimulated his love of field-sports more than his love of the classics. At the age of 24, he married, and went to reside at Bilton Hall, in Warwickshire, where he devoted his energies as exclusively to the chase as the great Nimrod himself could have done. He hunted everywhere in Great Britain. In 1821, he began to contribute to the *Sporting Magazine*. His clever, gossiping articles were so much relished, that in two years that periodical doubled its circulation. The proprietor, Mr. Pittman, was of course highly gratified. He remunerated Mr. A. handsomely, kept a stud of hunters for him, and paid the expenses of his sporting tours; but 'Nimrod' seems to have been of rather expensive habits, and to have occasionally required an advance of money from his employer. When Mr. Pittman died, his relatives entered into a lawsuit with the 'mighty hunter,' for the recovery of this money. Nimrod, however, prudently transferred himself to France, where he chiefly resided during the rest of his life. He died on the 19th of May 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827).

APPERT, BENJAMIN NICOLAS MARIE, a French philanthropist, was born in Paris, September 10, 1797. He began his course in 1816 by introducing into several schools a system of mutual instruction, and, in 1820, founded and conducted gratuitously a

school for the prisoners at Montagu. Being suspected of having aided the escape of two prisoners, he was himself confined in the prison of La Force, where he made good use of his opportunities of becoming acquainted with the moral and physical circumstances of prisoners. After his liberation, he prosecuted his benevolent plans with renewed zeal, and undertook a journey through the whole of France, in 1825, to inspect schools, prisons, hospitals, &c. The results were given in his Journal. After the July revolution, he was employed by Louis Philippe to superintend the measures taken for the relief of the indigent classes. In his travels, he visited Belgium, Prussia, Austria, Saxony, and Bavaria, and gave the results of his observations on the management of schools, hospitals, prisons, &c., in several works. He also wrote a work entitled *Deux Ans à la Cour du Roi Louis Philippe*, and, in his *Conférences contre le Système Cellulaire*, strongly opposed the system of solitary confinement. Though one-sided in some of his views, A. is a sincere, warm-hearted, and practical philanthropist.

APPERT, FRANÇOIS, a French technologist, the inventor of a method of preserving meat, vegetables, and other articles of food without the use of salt or other chemical application. This method is fully described in his work *L'Art de Conserver toutes les Substances Animales et Végétales* (4th edition, Paris, 1831). See ANTISEPTIC.

APPETITE. See HUNGER and THIRST.

APPIANI, ANDREA, styled in his day 'the Painter of the Graces,' was born at Milan, May 28, 1754. His poverty compelled him to gain a subsistence by decorative painting; but in the course of his travels, he studied the works of great masters, and formed for himself an original style, almost rivalling that of Correggio. At Rome, he devoted his attention to the frescoes of Raphael, and made such progress, that he soon excelled all living artists, in fresco-painting. The best evidences of his genius are found in the cupola of the church of *Sta. Maria di S. Celso* at Milan; and in the frescoes with which he decorated the villa of the Archduke Ferdinand in 1795. Napoleon I. appointed him court-painter. In return, he executed portraits of the French emperor and several of his generals. His most beautiful frescoes are the paintings on the ceilings of the palace of Milan, which consist of allegorical illustrations of Napoleon's career; and Apollo with the Muses in the Villa Bonaparte. Almost all the palaces in Italy contain frescoes by A. His finest oil-painting is Rinaldo in the garden of Armida. The fall of his patron, Napoleon I., left A. in indigent circumstances. He died November 8, 1817.

APPIANUS, a native of Alexandria, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He was author of a Roman history, in twenty-four books, of which only eleven are extant. It was not remarkable for anything except the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the empire, from its rude beginning on the Palatine Hill, to the period when its power held the whole world in awe, which is at once the popular and the philosophical method, he divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes, and afterwards followed the history of Sicily, Spain, Hannibal's wars, Libya, Carthage, and Numidia, Macedonia, Greece Proper and its colonies, Syria, Parthia, the Mithridatic war, the civil wars, and the imperial wars in Illyria and Arabia. As a historian, A. is a mere compiler, and not very accurate in his compilation. His geographical knowledge,

in particular, is singularly deficient, considering the age in which he lived. One specimen of his blunders will suffice: in his section on Spain, he states that it takes only half a day to sail from Spain to Britain.

The best edition of A. is that of Schweighäuser, Leipsic, 1785, in 3 vols.

APPIAN WAY (Lat. *Via Appia*), well named by an ancient writer *Regina Viarum* (the queen of roads), was formed, in part at least, by Appius Claudius Cæcus, while he was censor, (313 B.C.). It is the oldest and most celebrated of all the Roman roads. It led from the *Porta Capena* at Rome in a southerly direction to Capua, passing through Three Taverns, Appii Forum, Terracina, &c. Subsequently it was carried on to Beneventum, Tarentum, and thence to Brundisium. It had an admirable substructure or foundation, from which all the loose soil had been carefully removed. Above this were various strata cemented with lime; and, lastly, came the pavement, consisting of large hard hexagonal blocks of stone, composed principally of basaltic lava, and joined together with great nicety, so as to appear one smooth mass. The remains of it are still visible, especially at Terracina. The cost must have been enormous, for the natural obstructions are great. Rocks had to be cut through, valleys filled up, ravines bridged, and swamps embanked.

A'PPIUS CLAUDIUS CRASSUS, a Roman decemvir (451—449 B.C.). While the other decemviri were engaged in repelling an incursion made by the Sabines, A. C. and his colleague Oppius remained in Rome, with two legions to maintain their authority. Meanwhile A. C. had been smitten by the beauty of Virginia, daughter of a respected plebeian named Lucius Virginus, who was abroad with the army. By force and stratagem, representing that she was the born slave of Marcus Claudius, one of his clients, A. C. gained possession of the maid. His design was penetrated by Icilius, who was betrothed to Virginia, and who, aided by Numitorius, her uncle, threatened to raise an insurrection against the decemviri. Virginus, hurriedly recalled from the army by his friends, appeared and claimed his daughter; but, after another mock-trial, she was again adjudged to be the property of Marcus Claudius. To save his daughter from dishonour, the unhappy father seized a knife and slew her. The popular indignation excited by the case was headed by the senators Valerius and Horatius, who hated the decemvirate. The army returned to Rome with Virginus, who had carried the news to them, and the decemviri were deposed. A. C. died in prison, by his own hand (as Livy states), or was strangled by order of the tribunes; his colleague, Oppius, committed suicide; and Marcus Claudius was banished. The *Claudia Gens* (see GENS) was one of the most numerous and important of the patrician tribes or clans of Rome; and besides the sons and grandsons of the decemvir, there were numerous persons of distinction who bore the name of Appius.

APPLE (*Pyrus malus*. For the generic character see PYRUS). This well-known fruit has been very long cultivated, and by that means it has been very much improved. It was extensively cultivated by the Romans, by whom, probably, it was introduced into Britain. The wild A., or CRAB-tree, a native of Britain, and very generally found in temperate climates of the northern hemisphere, is a rather small and often somewhat stunted-looking tree, with austere, uneatable fruit, yet it is the parent of all, or almost all the varieties of apple so much prized for the dessert. The A.-tree, even in a cultivated state, is seldom more than 30—40 feet high. It has

a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced, 3—6 together, in sessile umbels, and are large, white, rose-coloured externally, and fragrant. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs, which spring from branchlets of two or more years growth, and continue to bear for a series of years. The fruit of the A. is, with regard to its structure, styled by botanists a *pome* (q. v.). The eatable part is what is botanically termed the *mesocarp* (See FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned at last by the dried 5-parted limb of the calyx; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as often to rattle when it is shaken.

The A. is now one of the most widely diffused of fruit-trees, and in the estimation of many, is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, &c., but there its fruit is as small and worthless as in high northern latitudes. The varieties in cultivation are extremely numerous. They have been classed with great care by recent German writers, by whom the classification and description of apples, pears, and similar fruits, has been treated as a sort of science, and dignified by the name of Pomology. Metzger, in his description of the pomaceous fruits of Southern Germany, describes 89 different kinds of A., all of which are constant, besides sub-varieties. New varieties are continually produced; and as they are chiefly preserved and propagated by grafting—although some

Apple-blossom.

of them also grow by layers and cuttings—the old ones gradually die out. The *costard*, from which dealers in apples received the name of costard-mongers, is no longer known. Many varieties are designated by the general names of *Pippins*, *Rennets*, *Codlins*, and *Culvilles*. Some kinds, not approved for the dessert, are in high esteem as baking-apples, and others still more acid or austere are preferred for the manufacture of CIDER (q. v.).

The A. is grown in Britain either as a standard,

an espalier, or a wall-tree, and is variously trained. It is usually grafted on A. or crab-stocks, but succeeds also on hawthorn-stocks, and is in this way sometimes introduced into hedges. A very dwarf variety, called the *Paradise A.*, is often used as a stock on which to graft it in order to produce dwarf-trees; and trees thus dwarfed are often very productive when little larger than currant or gooseberry bushes. Some of the varieties of A. are more hardy than others, and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others, both in flowering and ripening.

The wood of the A.-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit-tree, the A. requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, &c., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *Malic Acid*, which is extracted for medicinal purposes.—The fermented juice of the Crab A. is called *Verjuice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. Apples are an important article of commerce. Great quantities are imported into Britain, chiefly from France, Canada, and the northern parts of the United States. The A. keeps better than most kinds of fruit.

Beaufina or *Biffina* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat. They are prepared in great quantities in Norfolk.

The **SIBERIAN CRAB** is perhaps the parent, by hybridisation or otherwise, of some of the varieties of A. now in cultivation. Two species partake this designation, both natives of Siberia, and frequent in gardens in Britain, *Pyrus baccata* of Linnaeus, and *Pyrus prunifolia* of Willdenow, which, however, scarcely differ, except that in the former the sepals (leaves of the calyx) are deciduous, in the latter they are persistent—a circumstance of very doubtful importance as a specific distinction. The fruit is subglobose, yellowish, and rather austere, but is good for baking and for preserves.

The **AMERICAN CRAB** or **SWEET-SCENTED CRAB** (*P. coronaria*) is a native of North America, especially of the southern part of the Alleghanies. It is a small tree with broad leaves and white flowers, becoming purple before they drop off, and which have a powerful smell, resembling that of violets. The fruit is flatly orbicular, of a deep green colour, and sweet scented. It is very acid, but is made into cider, and also into preserves. *P. angustifolia*, a native of Carolina, much resembles this, but has much narrower leaves and smaller fruit.

The **CHINESE CRAB** (*P. spectabilis*) is a small tree, a native of China. It is very ornamental when in flower; the flowers being in sessile, many-flowered umbels, and of a bright rose-colour. The fruit is irregularly round, about the size of a cherry, yellow, and fit to be eaten, like the medlar, only when in a state of incipient decay.

APPLE OF SODOM. See SOLANUM.

APPLEBERRY. See BILLARDIERA.

A'PPLEBY, the county town of Westmoreland, lies in lat. 54° 35' N., long. 2° 28' W. It is in the north of the county, on the river Eden, which flows past Carlisle into the Solway Firth. A. has two parishes, one on each side of the river, which is here crossed by an old stone bridge of two arches. There

is a castle in the town, the keep of which, called Caesar's Tower, is still in tolerable condition. The Lent and summer assizes are held at A. Until the passing of the Reform Bill, it returned two members to parliament. It was then disfranchised, though it still possesses a municipal corporation. Pop. 2824.

A'PPLETON, a town of Outagamie co., Wisconsin, on the Grand Chute of the Fox River, and on the Chicago and N. W. R. R. 37 miles N. of Fond du Lac. The Grand Chute, affords immense water-power; and at the same time a series of dams renders the stream navigable for steamboats through its whole course—a navigation which, with the aid of a canal between the Fox on the north and the Wisconsin to the south, is carried all the way from Lake Michigan to the Mississippi. A. is the seat of Lawrence University. Population (1860) 2,345.

APPOGIATU'RA, an Italian musical term, designating a form of embellishment by insertion of notes of passage in a melody. The notes are printed in a smaller character than the leading notes of the melody, and should always be given with considerable expression. When they are extemporised by a performer or singer, they serve as an indication of good or of bad taste. The time of an A. is taken from the essential note to which it belongs, as in the following example:

Written.

Played.

For APPOGIA'to, see PORTAMENTO.

APPOINTMENT. In the law of England, there are frequently reserved in common law conveyances granted on a consideration, and in family settlements, certain *powers*, as they are called, such as powers of jointuring, selling, charging land with the payment of money; and the subsequent exercise of the power is called an *A.* This *A.*—which may be made either by deed or by will, is not considered as an independent conveyance, but is merely ancillary to the deed or instrument in which the power of A. is reserved, and from which the party in whose favour the A. is made for most purposes derives his title. The Courts of Equity give relief against a defective A., or defective execution of a power, where there is what is called a 'meritorious consideration' in the person applying for such relief. As to what amounts to such meritorious consideration, Lord St. Leonards, in his work on Powers, lays down that Equity will relieve the following parties: 1. A purchaser, including in such term a mortgagee and lessee; 2. A creditor; 3. A wife; 4. A legitimate child; and 5. A charity. But in the case of a defective A. by a wife in favour of her husband, there is no relief in Equity; nor is the Equity extended to a natural child; nor to a grandchild; nor to a father or mother, or brother or sister, even of the whole blood, much less of the half-blood; nor to a nephew or cousin. Against the legal consequences of an A., the courts of Equity give no aid.

In the Scotch law, the expressions *reserved power* and *faculty to burden* correspond to the English phrase 'power of A.;' and the deed or instrument subsequently executed in virtue of the reserved power, is simply described according to the nature and quality of the conveyance so made; but the term *A.* is not a technical word in Scotland.

APPOINTMENTS. The 'A.' of a ship are, collectively, all her various articles of equipment and furniture. In like manner, the 'A.' of a soldier, especially a trooper, comprise many miscellaneous necessities which can come collectively under no other name, but which, in part, will be found noticed under later headings. See **EQUIPMENT, KIT, KNAPSACK.**

APPORTIONMENT is a legal term derived from the 3 and 4 Will. IV. c. 22, called the Apportionment Act, which has given rise to much litigation in England and Scotland, and the principle of which may be stated to be this—that in the event of the termination of a life-interest by death, or of a more limited interest at a fixed period, the current rent or income shall be apportioned or paid over in such a way as to give the personal representatives of the party, or the party himself, as the case may be, a sum corresponding to the period that may have elapsed between the last date of payment and the death or other determination of the interest or estate. But the act has no application to annual sums payable by any policy of assurance, nor to any case in which a stipulation has been made that no A. shall take place.

This act was not understood to apply to Scotland till the year 1844, when it was decided by the Court of Session that it did so apply, and the judgment was afterwards affirmed by the House of Lords. But, in consequence of the act being expressed exclusively in the technical phraseology of the law of England, it has given much trouble and difficulty to the Scotch courts and Scotch lawyers, whose system of conveyancing, and of real property in general, is altogether different from the English. In the case referred to in the Court of Session, Lord Jeffrey, who was one of the judges, stated that he was Lord Advocate at the time the act was passed, but he had no knowledge of its passing. See an able article on this subject in the *Journal of Jurisprudence* (Scotch) for 1857, vol. i. p. 23.

In English law, A. also takes place where the tenant, under a lease, has been deprived of part of the land out of which the rent issues, by a person having a better title than that of the lessor, or proprietor, or where part of the rent has been surrendered by the tenant to the lessor, or where the lessor has disposed of the reversion as to part. But where the tenant has been wrongfully deprived by the act of the landlord himself, even of a part of the premises, there can be no A., but the whole rent will be suspended so long as such a state of things continues.

A. also obtains in the case of a conveyance of land to which the common of pasture is an appurtenance, the party getting the land being entitled to a proportionate use of the common.

APPOSITION, a term in Grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *My brother, the physician; Thomas, the Rhymist.* Whole sentences or clauses admit of A.: thus, 'Napoleon sought the way to India through Russia, a stroke of genius.' Sometimes a connecting word is used where logical propriety would require A.; as, *the city of London, for the city London.*

APPRAISERS AND APPRAISEMENT. An appraiser is a person employed to value property, but he must be licensed for the office. Formerly, under the 55 Geo. III. c. 184, this annual license cost only 10s.; but by the 8 and 9 Vict. c. 76, s. 1, on the preamble that it is expedient to increase this duty, the provision of the 55 Geo. III. is repealed, and a duty of £2 substituted for the 10s. Such a license must now be taken out yearly by every

person, except a licensed auctioneer, who shall exercise the occupation of an appraiser, or who, for any gain, fee, or reward, shall make any appraisement or valuation chargeable by law with any stamp-duty (see Tilsley on the Stamp-laws, 2d ed., p. 65).

By an old English statute, passed in the reign of Edward I., appraisers are enjoined to put a reasonable price upon goods; and if they appraise them too high, they are obliged to take them at their own valuation, and to be answerable accordingly to the creditor for his debt.

Appraisement, generally, is the act of valuation made by the appraiser; but in legal application in England, this term is used to signify a valuation of goods taken under a distress for rent by two appraisers, who are sworn by the sheriff, undersheriff, or constable, to value the goods truly, according to the best of their skill; and after such appraisement, the goods may be sold at the best price that can be procured.

The duties chargeable on appraisements are as follow: Where the amount of such appraisement or valuation shall not exceed £50, the duty to be 2s. 6d.; and where it shall exceed

£50, and not exceed £100,	£0	5	0
100, " " 200,	0	10	0
200, " " 500,	0	15	0
500,	1	0	0

The exemptions from such duties are appraisements or valuations made in pursuance of the order of any Court of Admiralty or Vice-admiralty, or of any Court of Appeal from any sentence, adjudication, or judgment of any Court of Admiralty or Vice-admiralty; and appraisements or valuations of any property made for the purpose of ascertaining the legacy-duty payable in respect thereof.

The corresponding proceeding in Scotland is known under the term *appreciation*, which has been defined as the valuing of *pounded* or *distrained* goods. And by the old Scotch law, these goods were valued twice by different valuers—once in the house or on the ground where the pouncing took place, and a second time at the market-cross of the local jurisdiction or chief county town. But by the 54 Geo. III. c. 137, s. 4, one valuation in the place where the goods are, is declared in every case to be sufficient.

APPREHEND. To A., in criminal law, means to arrest or seize, in virtue of a warrant or other legal authority, an offender taken in the act, or who is suspected. Arrest or apprehension by officers *without warrant* may be executed by the following persons: 1. By a justice of the peace, who may himself A., or cause to be apprehended, by word only, any person committing a felony or breach of the peace in his presence; 2. The sheriff; 3. The coroner; 4. The constable; 5. By the Larceny Act (the 7 and 8 Geo. IV. c. 29), and by the 7 and 8 Geo. IV. c. 30, called the Malicious Injuries Act, a person committing any offence under the same, except that of angling in the daytime, may immediately be apprehended without warrant; and 6. Watchmen—either those appointed by the statute of Winchester (13 Edw. I. c. 4), to keep watch and ward on all towns, from sunset to sunrise, or such as are mere assistants to the constables, may, in virtue of their office, arrest all offenders, and particularly night-walkers, and commit them to custody till the morning.

Any private person, and a *fortiori*, a peace-officer, that is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he is negligently permitted to escape; and by 14 and 15 Vict. c. 19, ss. 10 and 11, they may apprehend any person found committing any

offence against the provisions of that statute, or any indictable offence by night; that is, between nine in the evening and six in the morning of the next day. They may also, in the case of a person committing a felony in their presence, justify breaking open doors in pursuit of him. Upon probable suspicion, moreover, any one, even a private person, may arrest the felon or other person so suspected. But there is this distinction between the case of a peace-officer and that of a private person—that the former is protected, though it should turn out that no such crime as supposed has been in fact committed by any one, providing he had reasonable ground for suspecting the party arrested; but the latter acts more at his peril, and is not protected, unless he can prove an actual commission of the crime by *some one*, as well as a reasonable ground for suspecting the particular person. It is also to be observed that a private person cannot, on mere suspicion, justify breaking open doors, which a constable, though acting without a warrant, is competent to do. Within the metropolitan police district, a constable may take into custody, without warrant, all persons whom he may find, between sunset and the hour of eight in the morning, loitering or lying about and unable to give a satisfactory account of themselves; or persons charged with aggravated assaults; or persons offending against the metropolitan police acts, whose address cannot be ascertained. See 2 and 3 Vict. c. 47, ss. 36, 64, 65.

The Scotch law, with regard to the apprehension of criminals, is substantially the same as the English.

By the 13 Geo. III. c. 31, the 45 Geo. III. c. 92, and the 54 Geo. III. c. 186, facilities are afforded for the apprehension of criminals in England, Ireland, or Scotland, under warrants issuing from the respective authorities of the three countries, no further formality being necessary in the case of English and Irish warrants to be executed in Scotland, and *vice versa*, than that they should be endorsed by a judge of the territory where they are to be enforced. And by the 6 and 7 Vict. c. 34, provisions are made for the apprehension, in the United Kingdom of Great Britain and Ireland, of persons committing treason and felony in Her Majesty's dominions out of the United Kingdom, and *vice versa*, for the apprehension in such dominions of persons offending in England, Ireland, or Scotland. By section 3, offenders may be committed to gaol until they can be sent back to the place where the offence was committed; and information of the committal, in writing, under the hand of the committing magistrate, accompanied by a copy of the warrant, is directed to be given, in Great Britain, to one of Her Majesty's principal secretaries of state, and in Ireland, to the chief secretary of the lord-lieutenant; and in any other part of Her Majesty's dominions, to the governor or acting governor. By section 10, the important enactment is made, that it shall not be lawful to endorse any warrant for the apprehension of an offender under the act, unless it shall appear upon the face of such warrant itself, that the offence is such, that if committed within that part of Her Majesty's dominions where the warrant is endorsed, it would have amounted in law to treason, or some felony such as the justices of the peace in general or quarter sessions in England have not authority to try, under the 5 and 6 Vict. c. 38—by which the jurisdiction of general and quarter sessions is defined—or unless the depositions taken appear sufficient to warrant committal for trial. The effect of this enactment is, that the offences for which criminals may be apprehended, under the 6 and 7 Vict. c. 34, are as follow: Any treason, murder, or capital felony; or any felony which, when committed by a person not

previously convicted of felony, is punishable by transportation for life, or for any of the following offences:

1. Misprision of treason.
2. Offences against the Queen's title, prerogative, person, or government, or against either house of parliament.
3. Offences subject to the penalties of præmunire.
4. Blasphemy, and offences against religion.
5. Administering or taking unlawful oaths.
6. Perjury and subornation of perjury.
7. Making or suborning any other person to make a false oath, affirmation, or declaration, punishable as perjury or as a misdemeanour.
8. Forgery.
9. Unlawfully and maliciously setting fire to crops of corn, grain, or pulse, or to any part of a wood, coppice, or plantation of trees, or to any heath, gorse, furze, or fern.
10. Bigamy, and offences against the laws relating to marriage.
11. Abduction of women and girls.
12. Endeavouring to conceal the birth of a child.
13. Offences against any provision of the laws relating to bankrupts and insolvents.
14. Composing, printing, or publishing blasphemous, seditious, or defamatory libels.
15. Bribery.
16. Unlawful combinations and conspiracies, except conspiracies or combinations to commit any offence which justices or recorder respectively have or has jurisdiction to try when committed by one person.
17. Stealing, or fraudulently taking, or injuring or destroying records or documents belonging to any court of law or equity, or relating to any proceeding therein.
18. Stealing or fraudulently destroying or concealing wills or testamentary papers, or any document or written instrument being or containing evidence of the title to any real estate, or any interest in lands, tenements, or hereditaments.

On the 22d of August, 1843, an act of parliament (6 and 7 Vict. c. 75) was passed, by which provisions are made for carrying into effect a convention entered into between the British and French governments (determinable at pleasure) for the apprehension of offenders in the two countries respectively in *cases of murder, attempts to commit murder, forgery, or fraudulent bankruptcy*. On the same day, another act was passed (the 6 and 7 Vict. c. 76), containing regulations for carrying into effect a similar convention with the United States of America in cases of *murder, or attempts to commit murder, piracy, arson, robbery, forgery, or uttering forged paper*. Both these acts were afterwards amended by another (the 8 and 9 Vict. c. 120), the object of which is to give more immediate operation to these conventions, by facilitating the execution of the warrant, the committal, and detention in custody of the person apprehended, and his ultimate delivery into the hands of the French or American authorities, as the case may be.

The law encourages the apprehension of offenders by parties who simply act from a feeling of duty to assist justice. By the 7 Geo. IV. c. 64, s. 28 (amended and extended by the 14 and 15 Vict. c. 55), it is provided that when any person shall appear to any court of oyer and terminer, gaol delivery, superior criminal court of a county palatine, or any courts of sessions of the peace, to have been active in or towards the apprehension of any person charged with the various crimes contemplated by these statutes, every such court is authorised to order the sheriff of the county to pay to the person or persons who shall appear to the court to have been active in or towards the apprehension of any person charged with any of the said offences, such sum of money as to the court shall seem reasonable and sufficient to compensate such person or persons for his, her, or their expenses, exertions, and loss of time, in or towards such apprehension; but this power is to be exercised subject to such

regulations, as to the rate of allowance, as shall be made from time to time by a principal secretary of state. Provision is also made by the above statutes for compensation to the families of those who lose their lives in attempting to A. persons charged with criminal offences; but by the latter of these (14 and 15 Vict. c. 55, s. 7), this is not to interfere with the power of the criminal court to order payment to any person who shall have shewn extraordinary courage, diligence, or exertion, in the apprehension.

It only remains to be added, that any wilful obstruction of a lawful arrest or apprehension is esteemed an offence of a very aggravated nature. The modern enactments on this subject will be found in the acts the 9 Geo. IV. c. 31, s. 25, and 7 Will. IV. and 1 Vict. c. 85, s. 4; and see also the 14 and 15 Vict. c. 19, s. 12, already referred to. By the first of these acts, it is provided that where any person shall be convicted of any assault upon any peace-officer, or revenue-officer, in the due execution of his duty, or upon any person acting in aid of such officer, or of any assault upon any person, with intent to resist or prevent the lawful apprehension or detainer of the person so assaulting, or of any other person, for any offence for which he or they may be liable by law to be apprehended or detained; such assault shall be a misdemeanour, punishable with fine or by imprisonment, with or without hard labour, for any term not exceeding two years. By the second of these statutes it is enacted that whosoever shall unlawfully and maliciously shoot at any person, or shall, by drawing a trigger, or in any other manner, attempt to discharge any kind of loaded arms at any person, or shall stab, cut, or wound any person; with intent, in any of such cases, to resist or prevent the lawful apprehension or detainer of any person; shall be guilty of felony, and be punishable with transportation for life, or not less than fifteen years, or with imprisonment, with or without hard labour and solitary confinement, for not more than three years. And by the 14 and 15 Vict. c. 19, s. 12, passed for the prevention of offences at night, any one assaulting a person entitled to A. or detain him, shall be guilty of a misdemeanour, and on conviction, imprisoned, with or without hard labour, for any term not exceeding three years.

The same subject is treated in Scotch law-books under the head of *Deforcement*, which Sir Archibald Alison, in his work on the Criminal Law of Scotland (vol. i. p. 491), says, 'consists in the resistance to the officers of justice in the execution of their duty.' It is essential to such deforcement that it should be such as to defeat the warrant or other process which authorises the apprehension. Mere unsuccessful attempts with this view are charged under the name of *resisting and obstructing the officers of the law in the execution of their duty*. See WARRANT.

APPRENTICE is a person described in law-books as a species of servant, and called A. from the French verb *apprendre*, to learn, because he is bound by indenture to serve a master for a certain term, receiving in return for his services instruction in, or learning his master's profession, art, or trade; the master, upon the other hand, contracting to instruct the A., and according to the nature of the agreement, to provide food and clothing for the A., and to pay him small wages. Sometimes a premium is paid by the A., or on his behalf, to the master. By a provision of the 5 Eliz. c. 4, which remained in force until a recent period, it was in general required, that every person exercising a trade in England should have previously served as A. to it for seven years; but by 54 Geo. III. c. 96, that provision was abolished, with a saving of the customs and

by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the municipal act, 5 and 6 Will. IV. c. 76, s. 14 (which does not, however, extend to London), all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices, were also done away. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding. To the same effect it is the rule of the Scotch law that although a pupil—that is, a boy under 14, or a girl under 12 years of age—may be a party to an indenture as an A., yet he must have the concurrence of a parent or guardian, who alone can be liable to the master for the A.'s non-performance of the engagement. An A., on the other hand, who has passed the years of pupilarity, may effectually enter into an indenture by which he will be personally bound. It has been decided in England that the express assent of an infant A. to the indentures is essential to the contract; and therefore indentures of apprenticeship which had been executed by a father and master, but not by the A. himself, were held invalid. But an infant may bind himself A., because it is for his benefit; for the same reason, however, he cannot himself dissolve the contract. When an A. is bound to two partners, on the death of one of them he becomes the A. of the other.

There is a class who are bound out by the guardians of the poor, and are called *parish apprentices*, whose binding takes place under different circumstances. For the children of poor persons might formerly, even without becoming parties to the indentures, be apprenticed out by the overseers with the consent of two justices (and may now by the guardians, without such consent), till twenty-one years of age, to such persons as are thought fitting; and these persons were formerly also compellable to take them. But by 7 and 8 Vict. c. 101, s. 13, the reception of any poor child as an A. is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained; a subject which is besides now placed under the paramount control of the Poor-law Board, who have power to introduce new rules, from time to time, as they may think fit; and provisions are made by which the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shewn. Similar powers belong also to the justices, in the case of apprentices in general. (Stephen's *Commentaries*, vol. ii. p. 240, fourth edition.) It has been decided in England that a corporation cannot make a by-law limiting the number of apprentices which each member shall take, because such a regulation is deemed contrary to the laws of the land.

A mere agreement does not constitute an apprenticeship; there must be regular indentures formally executed. By statute 8 Anne c. 9, s. 39, indentures of apprenticeship in which the full sum or sums of money received, given, paid, secured, or contracted for, are not truly inserted, are void. But the act does not apply to cases where the sum is inserted in the indentures, though it is a less sum than that which was originally agreed for, and the reduction made to diminish the amount of the stamp-duty.

In the performance of the contract, a reasonable and equitable view is taken of the relative position of the parties. The master is not bound to the literal and uniform instruction of the A. by himself personally, but under his own superintendence, and by his own directions, he may avail himself of the

assistance of journeymen, or other persons serving in his place of business, and even of other apprentices—the object of the agreement being that the A. shall have the full benefit of all the master's arrangements in practising his art, craft, or trade. The A., on the other hand, although in the position of a servant to some extent, is not bound to serve as such, but may rather be said to be placed under the parental control of the master; and although the master may correct the A.'s faults and disobedience by moderate chastisement, he must not be vindictive or cruel; nor can he discharge the A. To that end, the master, under an unrepealed enactment of the 5 Eliz. c. 4, must complain to the Sessions, who decide whether the A. has merited his dismissal or not; the A., however, having a corresponding privilege in the case of his complaint against his master. But, by the Scotch law, a master can dismiss his apprentice in the case of his proving 'incorrigible.' By the custom of the city of London, a freeman may turn away his apprentice for *gaming*.

It was decided by the House of Lords, on an appeal from Scotland in 1837, and reversing the decision of the Court of Session, that a barber's A., whose indentures bound him 'not to absent himself from his master's business, holiday or week-day, late hours or early, without leave first asked and obtained,' could not be lawfully required to attend his master's shop on Sunday mornings for the purpose of shaving customers, because such employment was a violation of the old Scotch statutes still in operation, and which were enacted for enforcing the observance of the Sunday, particularly one passed in 1559, by which it is provided 'that na handy lauboring or winking be used on the Sondag.' The Lord Chancellor (Lord Cottenham) observed in his judgment that the English law on this subject was very similar, referring in particular to the 29 Charles II. c. 7, by which it is enacted 'that no tradesman, artificer, workman, labourer, or other person whatsoever shall do or exercise any worldly labour, business, or work, of their ordinary callings, upon the Lord's Day, or any part thereof, works of necessity and charity only excepted.'

An A.'s indenture is determinable by the consent of all the parties to it; and also by the death of the master. But the executor of the latter may bind the A. to another master for the remainder of his term; and he must also discharge any covenant or agreement for the A.'s maintenance, so far as he has assets. By the custom of London, if the master of an A. die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the A. to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the A., who, if he has paid an A. fee to the bankrupt, is entitled to be paid by the court a reasonable sum out of the estate.

By the Mutiny Act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretences*; and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

There is some curious historical matter on this subject, relating for the most part to a state of the law now obsolete or repealed, for which see Knight's *Political Dictionary*, under this head.

APPRIISING is the old technical term in the Scotch law, and now obsolete, for the process of adjudication. See ADJUDICATION.

APPROACHES, in military language, are the sunken trenches or excavated roads which are con-

structed by besiegers. The siege camp being usually at a considerable distance from the fortress or city attacked, the soldiers would be exposed to imminent danger while hastening across a belt of open country to enter any breaches made by the large siege guns, were it not that concealed roads are first constructed along which they may approach. In some cases the A. are not actual trenches, but merely paths shielded by a piled-up wall of sand-bags, fascines, gabions, woolpacks, or cotton-bales. The most tremendous combination of A. ever known in the history of military enterprise, was at the siege of Sebastopol in 1854—5; it comprised the digging of no less than 70 miles of sunken trench, and the employment of 60,000 fascines, 80,000 gabions, and 1,000,000 sand-bags, to protect the men working in the trenches and at batteries. See SAP, SIEGE, TRENCH.

APPROBATE AND RETROBATE. This is a technical expression in the law of Scotland, which signifies one of those rules of justice which commend themselves by their reasonable logic, and which are to be found in all enlightened systems of jurisprudence. It simply means, that no one can be permitted to A. and B.—that is, to accept and reject the same deed or instrument. Thus, if a will or settlement, purporting to dispose of real and personal property, all of which it directs to be converted into money, and in that form either to be equally divided or apportioned among the testators' children, consisting of a son or sons, and daughters, should, owing to some flaw or material defect, be invalid for the conveyance of the real estate, which, accordingly, by the operation of the law of descent, becomes the exclusive property of the eldest son as his father's heir—the law does not permit the latter to enjoy such estate, and at the same time to take benefit under the will in other respects, for this would be simultaneously to accept and reject the same instrument: he must elect between the two alternatives, and either avail himself entirely of his rights at law, as heir, or claim his share of the whole estate according to the testator's manifest intention—he cannot do both. Other illustrations might be given, shewing distinctions too nice perhaps for popular information. The analogous doctrine in the law of England is called ELECTION (q. v.). In one case decided by the House of Lords in 1819, the Lord Chancellor Eldon treated the rule in the Scotch and English legal systems as identical, observing that it was equally settled in Scotland as in England that no person can accept and reject the same instrument; and he puts the case of a testator giving his estate to A, but also giving the estate to which A would otherwise have been entitled, to B; in that case his lordship stated that courts of equity hold it to be against conscience that A should take the estate bequeathed to him, and at the same time refuse to effectuate the implied condition contained in the will of the testator. The court will not permit him to take that which cannot be his but by virtue of the disposition of the will, and at the same time to keep what, by the same will, is given, or intended to be given, to another person. It is contrary to the established principles of equity that he should enjoy the benefit while he rejects the condition of the gift.

It is chiefly in the case of wills and other testamentary dispositions that this legal doctrine most frequently arises in practice, although there can be no question that both in the English and Scotch systems of law it extends to all other writings, deeds, and instruments.

APPROPRIATION CLAUSE, THE. This is the name given to an innovation on the ecclesiastical law of Ireland, made by a statute passed in 1833,

the 3 and 4 Will. IV. c. 37, entitled 'An Act to alter and amend the Laws relating to the Temporalities of the Church in Ireland,' by which the temporalities of ten Irish bishoprics were suppressed and applied to other ecclesiastical purposes. The nature of the change it made with reference to these bishoprics may be thus stated. The first important section of the act on the subject is the 32d; it recites that 'his majesty has been graciously pleased to signify that he has placed at the disposal of parliament *his interest in the temporalities and custody thereof of the several bishoprics and archbishoprics mentioned in this act, and the schedule [B] thereto annexed:*' and the following is the schedule in question:

SCHEDULE B.

Bishoprics, when and as void, to be united to other Bishoprics or Archbishoprics.	Archbishoprics and Bishoprics to which the Bishoprics becoming void are to be united.
1. Dromore.	1. Down and Connor.
2. Raphoe.	2. Derry.
3. Clogher.	3. Armagh.
4. Elphin.	4. Kilmore.
5. Killala and Achonry.	5. Tuam.
6. Clonfert and Kilmacduagh.	6. Killaloe and Kilfenora.
7. Kildare.	7. Dublin and Glandelagh.
8. Ossory.	8. Ferns and Leighlin.
9. Waterford and Lisimore.	9. Cashel and Emly,
10. Cork and Ross.	10. Cloyne.

It then proceeds to enact that the bishoprics mentioned in the first column of this schedule (Dromore, &c.) when and as they severally become void, shall be thenceforth united to and held together with the bishopric or archbishopric mentioned in the second column (Down and Connor, &c.), and that thereafter the crown shall present the corresponding bishoprics in both columns to one and the same person (i. e., instead of there being, as formerly, a Bishop of Dromore, and a Bishop of Down, and Connor, the same person should be Bishop of Down and Connor and Dromore); and by section 33 it is further enacted, that if any bishopric in the second column of the schedule should become vacant before its union with the one mentioned in the first column, then the bishop of the latter shall become the bishop of both dioceses; i. e., for example, in the event supposed, if the Bishop of Derry were to predecease the Bishop of Raphoe, then the latter should become Bishop of Derry and Raphoe. This section, however, contains a proviso that it shall not authorise or empower any bishop of a diocese mentioned in the same first column to become Archbishop of Armagh or of Dublin; and, to complete the new arrangements, it is declared by section 46, that the provinces of Tuam and Cashel shall 'thenceforth and for ever cease to exist,' and that their archiepiscopal and metropolitan jurisdictions shall be transferred respectively to the Archbishops of Armagh and Dublin—a provision that is, perhaps, in principle the most serious inroad the act makes on the old law. In other respects, the sees of Tuam and Cashel—except in being enlarged under schedule B—continue as formerly.

But it is the 36th section that more immediately deals with the work of A. It enacts that the *temporalities* of the bishoprics in the first column of the same schedule shall be transferred to and vested in ecclesiastical commissioners, who, by section 2, are declared to be the Lord Primate of All Ireland, the Irish Chancellor being a Protestant, the Archbishop of Dublin, the Chief Justice of Ireland being a Protestant, all for the time being, and other persons

mentioned in the same section; and it declares that the commissioners shall have power and authority to take, purchase, and hold lands, tenements, and hereditaments for the purposes of the act, the statutes of mortmain, or any other act or acts to the contrary notwithstanding. Section 36 further provides that the said temporalities shall be received and applied by the commissioners to, for, and upon the several trusts, uses, and purposes in the act mentioned. These trusts, uses, and purposes are afterwards declared by section 63 to be as follow: 1. For the providing in such manner and proportions, and subject to such regulations as the commissioners shall deem fitting, things necessary for the celebration of divine service in the church or chapel of every parish, union, perpetual curacy, or chapelry, or chapel of ease in Ireland, as required and authorised by any rubric or canon in force in England or Ireland; 2. For the payment of the salaries of the parish clerks or sextons, or the clerks or sextons of any chapelry or chapel of ease; 3. For defraying such expenses of building, rebuilding, enlarging, or repairing any church or chapel, or fencing and maintaining any churchyard, as had been defrayed by vestry assessment in Ireland; 4. For supplying such parts or proportions of the expenses of providing for the said several matters; and 5. For putting into and keeping in repair cathedral and parish churches, to which purposes the commissioners are, by the following section, the 64th, empowered to contribute. Further, by section 71, the commissioners are authorised to advance money for extraordinary repairs of ecclesiastical buildings; and the act contains other provisions of a like nature, showing the intention of the legislature to be, that the revenues and other temporalities of the bishoprics before mentioned should be applied to strictly ecclesiastical purposes.

From this account of the above important statute (the 3 and 4 Will. IV. c. 37), and its celebrated 'appropriation clause,' it would appear, 1st, That the ten bishoprics themselves were not strictly, or in a spiritual sense, suppressed. The act nowhere provides that they shall cease to exist as separate and distinct dioceses, but it simply declares that they shall respectively be held by the same person in union with the other and corresponding dioceses mentioned. The only change, therefore, in this sense which the act makes is, that instead of having, as before, separate and independent bishops for themselves, the 'suppressed' bishoprics shall, under their old names, and having regard to all their peculiarities, have their ecclesiastical laws and spiritual duties administered and performed by a prelate, who shall also be the bishop of another diocese; and 2d, That even as regards the *temporalities* of the ten bishoprics, these are applied exclusively for the benefit of the Established Church of Ireland, in the strictest meaning of its ecclesiastical purposes. In fact, in regard to these temporalities, the act does no more, in principle, than many benevolent prelates themselves are known to do spontaneously in the charitable and conscientious application of their revenues. The munificent charities of the late Bishop of London (Dr. Blomfield), and of the present Protestant Archbishop of Armagh, the Irish primate (Beresford), are remarkable instances of the generous conduct we refer to.

The effect of the view we have explained respecting the position in which the 'appropriation clause' has put the Irish Church is very important; for the act of parliament containing it, simply leaves things in such a state, that should at any time hereafter the spiritual wants of the people of Ireland require the complete restoration of the ten bishoprics to their former administration and privileges, all

that it would be necessary to do, so far as the spiritual and ecclesiastical character of the said bishoprics are concerned, would be to repeal section 32 of the 3 and 4 Will. IV. c. 37, with all the other relative and dependent provisions; by which simple expedient the ten bishoprics would necessarily and of themselves revive in all their pristine vigour and authority, without the necessity of any new creation or canonical formation, according to the laws ecclesiastical. This could not be, however, had these ten bishoprics been finally and for ever suppressed. And this argument ought to some extent to give relief to the feelings and hopes of those jealous and ardent churchmen who, since the passing of the 3 and 4 Will. IV. c. 37, have never ceased to denounce its A. C.

It should, however, be stated, that no alteration of the ecclesiastical arrangements provided for by that act is at the present day anticipated.

APPROVER, or PROVER, in the law of England, is a person who had been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. It had not so simple and intelligible a meaning in the ancient practice of the criminal law, in which *approvement* was a kind of confession of a complicated nature. Where a person in a prosecution for treason or felony confessed the fact before pleading to the indictment, and, at the same time, accused others, his accomplices, of the same crime, in order to obtain his pardon, he was called an *A.* or *P.* But, as the condition of the pardon he thus expected was the conviction of the accomplice he accused, if that failed, the *A.* received judgment of death upon his own confession. If, on the other hand, the accused accomplice was found guilty, the *A.* was entitled to his pardon *ex debito justitiæ*. But 'this course of admitting approvements,' says Blackstone, writing about a century ago, 'hath long been disused; for the truth was, as Sir Matthew Hale observes, that more mischief arose to good men by these kinds of approvements, upon false and malicious accusations of desperate villains, than benefit to the public by the discovery and conviction of real offenders; and, therefore, in the times when such appeals were most frequently admitted, great strictness and nicety were held therein; though, since their discontinuance, the doctrine of approvements is become a matter of more curiosity than use.'

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to become *Queen's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. The admission, however, of an accomplice to give evidence against his fellows, requires the previous sanction of the judges of jail delivery, and a motion is usually made at the trial to the judge for leave to admit the accomplice for that purpose. The testimony of an accomplice is in all cases, however, regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as *Queen's evidence*, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation, or fraud, he then forfeits all claim to protection, and may be tried, convicted, and punished on his own confession. Accordingly, upon a trial at York, towards the commencement of the present century, before the late Mr. Justice Buller, the accomplice denied in his evidence all that he had before confessed, upon which the prisoner was acquitted. But the judge ordered an indictment to be preferred

against the accomplice for the same crime, and on his previous confession, and other circumstances, he was convicted and executed.

The term in the law of Scotland analogous to that of *A.* is *socius criminis*, and the principles on which such socius is admitted, and on which his evidence is left to the jury, are the same as in England. But the criminal courts in Scotland go further in protecting and assuring safety to the approver than the English practice does. Sir Archibald Alison, in his *Practice of the Criminal Law of Scotland*, vol. ii., p. 453, says: 'It has long been an established principle in our law, that by the very act of calling the *socius*, and putting him in the box, the prosecutor debars himself from all title to molest him for the future with relation to the matter libelled. This is always explained to the witness by the presiding judge as soon as he appears in court, and consequently he gives his testimony under a feeling of absolute security as to the effect which it may have upon himself. If, therefore, on any future occasion the witness should be subjected to a prosecution on account of any of the matters contained in the libel on which he was examined, the proceedings would be at once quashed by the supreme court. This privilege is absolute, and altogether independent of the prevarication or unwillingness with which the witness may give his testimony. Justice, indeed, may often be defeated by a witness retracting his previous disclosures, or refusing to make any confession after he is put into the box; but it would be much more put in hazard if the witness was sensible that his future safety depended upon the extent to which he spoke out against his associate at the bar. The only remedy, therefore, in such a case, is committal of the witness for contempt or prevarication, or indicting him for perjury, if there are sufficient grounds for any of these proceedings. In this respect the security of the *socius*, and the safeguard against the contamination of the sources of evidence, is much stronger in this country than in England, where it is held that the circumstance of having been adduced by the crown is not a bar to trial, but only the foundation for a recommendation to the crown for mercy, and is entirely dependent on the witnesses making a full and fair disclosure.' And Sir Archibald mentions a case where a soldier, who was adduced as an *A.* or *socius*, and who was under confinement as a military delinquent for the same offence, was nevertheless allowed to give evidence; and upon its being suggested as an objection to the soldier's being admitted as a witness, that he would still be open to be tried by a court-martial, the court declared that they had the power to protect him from such an ordeal, and that they would not fail to interfere on his behalf, if he were in any way endangered in consequence of his evidence.

It was chiefly on the evidence of an accomplice named William Hare, that Burke the notorious criminal was convicted before the High Court of Justiciary in 1828. See this case noticed previously in *ANATOMY*.

APPROXIMATION, a term commonly used in mathematical science to designate such calculations as are not rigorously correct, but approach the truth near enough for a given purpose. Thus in logarithmic and trigonometrical tables nearly all the numbers are mere approximations to the truth. The calculations of astronomy generally are of this nature. Even in pure mathematics there are parts in which approaches to the truth, by means of interminable series, are all we are able to gain. The solution of equations beyond the fourth degree can be got only by approximation.

APPUI (French), a stay or support. In military

tactics, the *points d'A.* are such parts of the field of battle as are suited to give support or shelter. As the wings of an army (like the extreme sides of a chess-board) are the weakest points of resistance to attack, they especially require support or protection, and are placed, when it is possible, in localities which serve to obstruct the attacking forces. Lakes, morasses, woods, streams, and steep declivities may thus serve as *points d'A.*

APPULEIUS, or, less properly, APULEIUS, a satirical writer of the 2d c., was born at Madaura, in Africa, where his father was a magistrate, and a man of large fortune. A. first studied at Carthage, which at that time enjoyed a high reputation as a school of literature. Afterwards he went to Athens, where he entered keenly upon the study of philosophy, displaying a special predilection for the Platonic school. The fortune bequeathed to him at his father's death enabled A. to travel extensively. He visited Italy, Asia, &c., and was initiated into numerous religious mysteries. The knowledge which he thus acquired of the priestly fraternities, he made abundant use of afterwards in his *Golden Ass*. His first appearance in literature arose from a lawsuit. Having married a middle-aged lady, named Pudentilla, very wealthy, but not particularly handsome, he drew down upon his head the malice of her relations, who desired to inherit her riches, and who accused the youth of having employed magic to gain her affections. His defence (*Apologia*, still extant), spoken before Claudius Maximus, proconsul of Africa, was an eloquent and successful vindication of his conduct. After this event, his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. He was so extremely popular, that the senate of Carthage, and other states, erected statues in his honor.

The *Golden Ass*, the work by which his reputation has survived, is a romance or novel, whose principal personage is one *Lucian*, supposed by some, though on insufficient evidence, to be the author himself. It is generally understood to have been intended as a satire on the vices of the age, especially those of the priesthood, and of quacks or jugglers affecting supernatural powers, though Bishop Warburton, and other critics, fancy they can detect in it an indirect apology for paganism. Its merits are both great and conspicuous, as are also its faults. Wit, humour, satire, fancy, learning, and even poetic eloquence abound, but the style is disfigured by excessive archaisms, and there is a frequent affectation in the metaphors, &c. which proves A. to have been somewhat artificial in his rhetoric. The most exquisite thing in the whole work is the episode of Cupid and Psyche (imitated by La Fontaine). It is supposed to be an allegory of the progress of the soul to perfection. Besides the *Apologia* and *Golden Ass*, we have from the pen of A. an Anthology in four books, a work on the *Dæmon* of Socrates, one on the doctrines of Plato, one on *The Universe*, &c. A considerable number of his works also are lost. The most recent and careful edition of the whole works of A. is that published at Leipsic in 1842, by G. F. Hildebrand. The *Golden Ass* was translated into English by T. Taylor (1822), and again by Sir G. Head (1851). An English version of the works of A. was published in London, 1853.

APRA'XIN, THEODOR MATVAYEVICH, a distinguished Russian admiral, was born in 1671. When hardly twelve years of age, he entered the service of Peter the Great, who conceived a great attachment for him, which lasted during the whole life of the monarch. In 1699, he took part in the first manœuvres of the Russian fleet at Taganrog on the sea of Azof. After the year 1700, he became

the most powerful and influential person at the court of the czar, who made him chief-admiral of the Russian navy, of which, in fact, A. may be considered the creator. While Peter was fighting the Swedes in the north, A. was building war-vessels, fortresses, and wharfs in the south. In 1707, he was appointed president of the Admiralty; in 1708, he defeated the Swedish general, Lübecker, in Ingermannland, and saved the newly-built city of Petersburg from destruction; in 1710, he captured the important town of Viborg, in Finland; and in 1711, commanded in the Black Sea during the Turkish war. The following year he returned to the north; and in 1713, with a fleet of 200 vessels, he sailed along the coast of Finland, took Helsingfors and Borgo, and defeated the Swedish fleet. The result of his great successes was, that at the peace of Nystadt, in 1721, Russia obtained some most valuable advantages, being confirmed in her possession of Finland, just conquered, and of Esthonia. In spite of his brilliant reputation, however, he twice suffered an apparent eclipse of imperial favour. In 1714—15 he was charged with embezzlement, tried, and condemned to pay a fine; and a few years later, was denounced by Peter himself as 'an oppressor of the people,' and again condemned to pay a fine; but his services were too useful to be dispensed with, and in both instances the czar neutralised the effect of the condemnation, by conferring upon him additional riches and dignities. In 1722, he accompanied Peter in his Persian war, and was present at the siege of Derbend. His last naval expedition was in 1726, when he repaired with the Russian fleet to Revel, to defend that place against an expected attack by the English. He died at Moscow, 10th November 1728, in the 57th year of his age.

A'PRICOT (*Prunus Armeniaca*), a species of the same genus with the PLUM (q. v.), is a native of Armenia, and of the countries eastward to China and Japan; a middle-sized tree of 15—20, or even 30 feet high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun, with yellow flesh. The A. was brought into Europe in the time of Alexander the Great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th c. It is only in the south of England that it is ever trained as a standard, nor is it grown in the more northern parts, even as an espalier, but almost always as a wall-tree. More than twenty kinds are distinguished, amongst which some excel very much in size, fine colour, sweetness, and abundance of juice. The *Moorpark* is generally esteemed the finest variety, and the *Breda* as best suited for standards in the south of England, and in Scotland even for the wall, except in the most favourable situations.—The A. is generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are brought from Italy as an article of commerce, in particular from Trieste, Genoa, and Leghorn: in the south of France, also, they are an article of export in a preserved and candied state. Dried apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably more natural, and the sweetness, as in the almond, the result of cultivation. Generally speaking, they may be used for the same purposes as

almonds. From the bitter kernels, which contain Prussic acid, the *Eau de noyau* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The BRIANÇON A. (*Prunus Brigantica*) very much resembles the common A. The fruit is glabrous. It is found in Dauphiny and Piedmont. At Briançon, an oil, called *Huile de marmotte*, is expressed from the seed.

The SIBERIAN A. (*P. Sibirica*) is also very like the common A., but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria.

The A. PLUM is an excellent kind of plum, much cultivated in some parts of France, and which, preserved in sugar, dried, and packed in shallow boxes, forms a considerable article of trade.

APRIL. The Romans gave this month the name of *Aprilis*, from *aperire*, to open, because it was the season when the buds began to open; by the Anglo-Saxons it was called Ooster, or Easter-month; and by the Dutch Grass-month. The custom of sending one upon a bootless errand on the first day of this month, is perhaps a travesty of the sending hither and thither of the Saviour from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a miracle-play (q. v.) at Easter, which occurs in the month of A. It is possible, however, that it may be a relic of some old heathen festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. In France, one thus imposed upon is called *un poisson d'Avril* (an A. fish). In England, such a person is called an A. fool; in Scotland, a gowk. Gowk is the Scotch for the cuckoo, and also signifies a foolish person. The favourite jest in Britain is to send one upon an errand for something grossly nonsensical—as for pigeon's milk, or the History of Adam's Grandfather; or to make appointments which are not to be kept; or to call to a passer-by that his latchet is unloosed, or that there is a spot of mud upon his face. When he falls into the snare, the term A. fool or gowk is applied with a shout of laughter. It is curious that the Hindus practice precisely similar tricks on the 31st of March, when they hold what is called the Huli Festival.

À-PRIO'RI reasoning or demonstration is that which rests on general notions or ideas, and is independent of experience. Reasoning from experience is called *a-posteriori* reasoning. A predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato may be taken as typical of the A-P. school, Locke and Bacon of the other. A-P. speculation is more in accordance with the genius of the Germans than with that of the practical British. A-P. philosophy claims for its conclusions the character of necessary truths, and denies that there can be a-posteriori proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which A-P. reasoning rests, are themselves the results of experience, and that, therefore, all truth rests really on *a-posteriori* grounds.

A'PRON. This word is employed both in military and in shipping affairs. The A. of a cannon is a piece of sheet-lead which covers the touch-hole, tied by two pieces of white rope. In ship-building, the A. is a piece of curved timber fixed behind the lower part of the stem, and just above the fore-

most end of the keel; its chief use is to fortify the stem, and connect it more firmly with the keel. The name of A. is also given to the plank-flooring raised at the entrance of a dock, a little higher than the bottom, to form an abutment against which the gates may shut.

APSE (Lat. *apsis*), a semicircular recess usually placed at the east end of the choir or chancel of a romanesque, or what is commonly called in England an Anglo-Saxon or Anglo-Norman church. The origin of this peculiar termination to the choir is so curious, and has been so clearly established by recent German writers, that we shall endeavour to state it in a very few words. It is well known that the heathen structure from which the early Christians borrowed the form of their churches, was not the temple but the Basilica or public hall which served at once for a market place and a court of justice. The Basilica, for the most part, was a parallelogram, at one of the shorter sides of which, opposite to the entrance, there was a raised platform destined for the accommodation of the persons engaged in, and connected with, the distribution of justice. This portion of the building was the prototype of the rounded choir, to which the name of A.

Church at Schwartz, Rheindorf.

was given, and which is still to be seen in so many of the Rhenish churches. For the prætor's chair, which was placed in the centre of this semicircular space, the altar was substituted; and the steps which led to the seat from which he dispensed justice, were destined henceforth to lead to the spot where the Fountain of all justice should be worshipped. Many A.'s are to be met with in English churches, an enumeration of which will be found in Mr. Parker's excellent Glossary of Architecture. But as the structure is not only much more frequent, but continued to be used to a much later period on the continent, we shall describe it as it may still be seen in almost every little village along the banks of the Rhine. The lower part of the A. is there usually pierced by two or three round arched windows, often of irregular size and height, over which there is invariably an external gallery supported by pillars, in the form of which the rude idea of a Roman pillar is at once apparent; and the whole is joined to the end of the nave, which rises considerably above it, by a roof in the form of the segment of a cone. Where the churches are larger, there is a

Vol. I., page 337.

APTERYX.

[From specimens in the London Zoological Gardens. These birds are fed upon minced mutton and worms, of which each consumes about half a pound daily.]

complete row of windows of the same rounded form, divided by pillars similar to those by which the gallery is supported, and under them frequently a line of arches of corresponding construction, whilst one or two small and irregular holes of the same form give a scanty light to the crypt beneath. Many of the smaller churches have no aisles; and the semicircular A. forms the termination of, or rather contains the chancel. The more complete specimens of the style, however, such as the minister at Bonn, afford—with the exception of the transepts and the towers, which are later additions—about the most perfect examples to be found on this side the Alps of the form of the Roman basilica, as first adapted to Christian uses. Several examples of the A. are to be seen in the earlier ecclesiastical

Church of Dalmeny.

structures of Scotland; as instances, we may mention the churches of Dalmeny and Kirkliston in Linlithgowshire, and of Leuchars in Fife.

A'PSIDES (Gr. *apsis*, connection), the two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term A. is also applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other furthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A right line connecting these extreme points, is called the line of A. In all the planetary orbits, this line has no fixed position in space, but makes a forward motion in the plane of the orbit, except in the case of the planet Venus, where the motion is retrograding. This fact in the orbit of the earth gives rise to the anomalistic year (q. v.). This advancing motion of the line of A. is especially remarkable in the orbit of the moon, where it amounts to $40^{\circ} 40' 32'' \cdot 2$ annually, an entire revolution thus taking place in rather less than nine years.

APSLEY, a river of Australia, in the north division of New South Wales. It flows into the open Pacific about 40 miles to the north-east of Port Macquarrie, appearing to assume at its mouth the name of the M'Leay.—A. is also a strait between Melville and Bathurst Islands, on the north coast of Australia. Its length is 48 miles, with a width varying from $1\frac{1}{2}$ to 4; and the depth of its channel is from 8 to 24 fathoms.

A'PTEROUS INSECTS are insects without wings. In the Linnæan system, the *Aptera* form an order of insects; but more important distinctive characters being found to belong to the insects included in it, it is no longer retained as an order or principal division in the most improved entomological systems.

A'PTERYX (from the Gr. *a*, priv., and *pteryx*, a wing), a genus of birds allied to the ostrich and

emu, and perhaps more nearly to the extinct dodo. It has a very long and slender bill, of which it

Apteryx.

makes a remarkable use in supporting itself when it rests. It has three anterior toes, and a posterior one which is scarcely developed. The legs are of moderate length, the wings merely rudimentary. The feathers have no accessory plume. The diaphragm is more complete than in any other known bird. Only one species is known (*A. Australis*), about the size of a goose, a native of New Zealand. It is a nocturnal bird, and preys on snails, insects, &c. It is much prized for its feathers. The natives call it *kivi-kivi*, from its cry.

A'PTHE are small vesicles formed of the superficial layer of a mucous membrane, elevated by fluid secreted by the latter. They are usually whitish in colour, and the fluid may be serous or puriform. At the end of a few hours or days, the apthous vesicle bursts at its summit, and shrivels up, exposing an inflamed and painful patch of the mucous membrane. The most common site of A. is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin.

Infants are liable to an apthous eruption termed *thrush* (q. v.). A. in adults are generally the consequences of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of A., a preparation of borax, or some astringent wash, generally effects a rapid cure.

APU'LIA, a part of ancient Iapygia (so named after Iapyx, son of Dædalus), now includes the south-eastern part of Italy as far as the promontory of Leuca, and also the extreme peninsula of Calabria. Here, in ancient times, lived three distinct peoples—the Messapians or Salentini, the Peuceni, and the Dauni or Apulians. According to old Latin traditions, Daunus, king of the Apulians, when banished from Illyria, settled in these parts of Italy. Later traditions say that Diomedes, the Ætolian, with several other heroes returning from the Trojan war, came to Italy, and, in his war with the Messapians was assisted by Daunus, but was afterwards deprived of his territory, and put to death. Roman poetry has preserved these old names; but in history, no mention is made of any king of A., though we find the names of its principal cities—Arpi, Luceria, and Canusium. The second Punic war was for some time carried on in A. In the present day, A. (now styled **PUGLIA**) is merely the name of a geographical district, and has no political meaning. The whole territory, including the Neapolitan provinces, Capitanata, Terra di Bari, Terra d'Otranto, &c., is but a shadow of its former self, in the time of the Greek colonies, under Roman dominion, or even under the Normans, who took possession of it in 1043 A. D. The towns are depopulated, industry

has disappeared, and commerce, once so flourishing, has passed away. Agriculture is in a very low condition, and the few roads are infested by banditti. The people are generally ignorant and superstitious, but deserve praise for their hospitality to travellers.

APURÉ, a river of New Granada and Venezuela, which rises in the East Andes, near lat. 7° N., and long. 72° W. After receiving the Portuguesa and the Guarico from the north, it joins the Orinoco, in lat. 7° 40' N., and long. 66° 45' W. It waters the towns Nutrias and San Fernando.

APURIMAC, a river of Peru, which, after a course of 500 miles, assumes the name, first, of Tambo, and then of Ucayali, which again, after a course of 500 miles more, joins the Tangaragua to form the Amazon. The A. proper rises to the north-west of the great table-land of Lake Titicaca, receiving from it, however, no portion of its waters. Among the tributaries of the Amazon, it is one of the most southerly; while among them, it approaches perhaps the nearest to the Pacific. The A., from its source in lat. 16° S., drains the eastern face of the Andes through about 5°, till it changes its name, as above, in 10° 45' S., meanwhile receiving several considerable affluents, more especially the Villcamayo, from the opposite quarter. The A. and its feeders partake of the nature rather of mountain torrents than of navigable rivers; and even for travelling by land, their rocky and rugged banks are always difficult, and often impracticable. The valleys vary in climate and productiveness according to their elevation. The upper ones yield wheat and barley, and most of the fruits of Europe; while the lower, or at least the lowest ones, abound in sugar and cotton, plantains and pine-apples. The basin of the A., as a whole, is said to be the finest part of Peru, and to contain the largest proportion of native population—the best specimens apparently of the aboriginal civilisation.

AQUA FORTIS, literally, *strong water*, was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

AQUA MARINE, a name sometimes popularly given to the Beryl (q. v.). Some green and blue varieties of topaz have also been styled A.

AQUA REGINÆ, literally, *queen's water*, is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves much fumes, and may be used as a disinfectant, as similar mixtures are sold under the name of *everlasting disinfectants*.

AQUA REGIS, or REGIA, literally, *royal water*, is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term aqua regia (royal water) was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

AQUARIUM, a tank or vessel containing either salt or fresh water, and in which either marine or fresh-water plants and animals are kept in a living state. The name was formerly sometimes given to a tank or cistern placed in a hot-house, and intended for the cultivation of aquatic plants. It is not long since the A., as now in use—originally called *Vivarium* or *Aquavivarium*, and intended chiefly for animals—was first invented; but it soon became extremely common, not only as an aid to scientific study, but as an ornament of drawing-rooms, and a source of rational amusement. It depends in principle upon the relations discovered by modern science between animal and vegetable life, and particularly upon the consumpt by plants, under the action of light, of the carbonic acid gas given forth by animals, and consequent restoration to the air or water in

which they live of the oxygen necessary for the maintenance of animal life. The A. must, therefore, contain both plants and animals, and in something like a proper proportion. Zoophytes, Annelides, Mollusca, Crustacea, and Fishes may thus, with due care, be long kept in health, and their habits observed. The water must be frequently aerated by agitation in some way, for which there are various contrivances, but which is very well accomplished by taking up portions of it and pouring them in again from a small height. The fresh-water A. is frequently provided with a fountain, so that in it there is a continual change of water; but even where this is the case, the presence both of plants and animals is advantageous to the health of both. When seawater cannot easily be procured for the marine A., a substitute for it may be made by mixing with

Simple form of an Aquarium.

rather less than 4 quarts of spring water, 3½ ounces of common table-salt, ½ ounce of Epsom salts, 200 grains troy of chloride of magnesium, and 40 grains troy of chloride of potassium. With due care, the water may be kept good for a long time. No dead animal or decaying plant must be permitted to remain in it. Salt water, artificially prepared, is not fit for the reception of animals at once; but a few plants must first be placed in it, for which purpose some of the green algæ, species of *Ulva* and *Conferva*, are most suitable. The presence of a number of molluscous animals, such as the common periwinkle, is necessary for the consumption of the vegetable matter continually given off by the growing plants, and of the multitudinous spores (seeds), particularly of *confervæ*, which would otherwise soon fill the water, rendering it greenish or brownish, and untransparent, and which may be seen beginning to vegetate everywhere on the pebbles or on the glass of the tank. In a fresh-water A., molluscous animals of similar habits, such as species of *Lymnæa* or *Planorbis*, are equally indispensable. For Aquaria of a large size, tanks made of plate-glass are commonly used; smaller ones are generally in the form of vases or basins, and are made of bottle-glass or of crystal.

Of course, the plants and animals with which the A. is stocked are various, according to the taste and opportunities of its owner, or the desire to make particular kinds the subjects of careful and continued observation. Blennies, gobies, and gray mullets are perhaps the kinds of fish most commonly seen in marine aquaria; gold-fishes, sticklebacks, and minnows are frequent enough in fresh-water ones. These have the advantage of being more easily kept in good health than many other kinds, and a further recommendation is found in their small size, and in the fine colours of the gold-fish. The nests of stickle-

backs are a subject of unfailling interest. Crabs of various species, and actinæ, or sea-anemones, are very generally among the larger inmates of the A. *Serpulæ* contribute much both to its interest and beauty, as they spread out their delicate and finely tinted branchiæ from the mouth of their shelly tube, and withdraw within it, quick as thought, upon the slightest disturbance. Balani, or acorn-shells, are very beautiful objects when they are seen opening their summit-valves, and rapidly stretching out and retracting their little nets. Even periwinkles and limpets are interesting, particularly when they are watched by the aid of a magnifying-glass, as they feed upon the spores of the confervæ which have just begun to vegetate on the glass of the A., moving slowly along, with continual opening and shutting of the mouth, like cows at pasture, when the structure and motions of their mouths may be observed, and the singular beauty and brilliancy of colours never fails to command admiration. The use of a good magnifying lens adds greatly to the

Aquarium, with fountain for aerating.

interest of the A., and zoophytes of exquisite forms and colours may be watched in the actual processes of life. The feeding of fishes, crabs, sea-anemones, &c., is a source of amusement, and it is interesting even to note how the inmates of the A. occasionally feed on their fellow-prisoners.

The idea of the A. seems to have originated from Mr. Ward's invention of the *cases* which bear his name (see *WARDIAN CASES*), and in which delicate ferns and other plants grow so well even in towns. Mr. Warrington appears to have been the first to make experiments on its practicability, and the name of Mr. Gosse is intimately connected with its early development and introduction to popularity. The largest aquaria in the world are those in the Zoological Gardens, Regent's Park, London. But private ones are so numerous, that not only the manufacture of them, but also the supplying of them with plants and animals, have become distinct branches of trade.

AQUARIUS, the *Water-bearer*, the eleventh sign of the zodiac, through which the sun moves in part of the months of January and February. It is also the name of a zodiacal constellation, whose position in the heavens may be found by producing a line in a southerly direction through the stars in the head of Andromeda and the wing of Pegasus.

AQUATIC plants and animals are those that live either wholly or partly in water. The term is very vaguely used, those plants being often called A. which grow in ponds, ditches, &c., although not only their inflorescence, but great part of their foliage, is above the surface of the water, as well as those which more completely belong to that element; and a similar latitude of meaning prevails with regard to animals. Few phanerogamous (or

Aquatic plant.

flowering) plants exist entirely under water, although there are a few, like the common *Zostera marina*, or Grass-wrack, which do so, and produce even their flowers in that condition; others, of which the greater part of the plant is usually under water, produce their flowers upon, or considerably above, its surface, as those of the genera *Valisneria*, *Anacharis* (q. v.), &c. The leaves, as well as the flowers, of many float upon the water, of which the water-lilies furnish well-known and beautiful examples; whilst in *Ranunculus aquatilis*, that exquisite ornament of our river margins, we have an instance of a kind not unfrequent, of great diversity between the lower leaves which remain submersed, and the upper leaves which float. Of cryptogamous plants, one great order, Algæ, is exclusively A., and these seem adapted to perform under water all the functions of their life. A. plants are, in general, of less compact structure than is usual in other plants, and are thus lighter and better adapted for rising in their growth towards the surface of the water; in order to which also some of the algæ, as may be seen in more than one of the most common sea-weeds of our coasts, are provided with air-bladders of considerable magnitude. All this is the more necessary, as plants completely A. have generally little firmness of stem, and if their weight made them fall to the bottom, would lie in a mass, as they do when withdrawn from the water, in which, however, they gracefully float, their flexibility of stem enabling them to adapt themselves to waves or currents which would destroy them if they were more rigid. So admirably are all things in nature harmonised.

Many animals, to a considerable extent A. in their habits, must not only breathe air, but are adapted for spending great part of their existence on dry land. Such are chiefly those that seek their food in the water. The peculiarities of structure by which they are fitted for wading, for swimming, for diving, and for remaining under water a longer time than other animals can, are very interesting and admirable. Even the fur of the beaver, the otter, the water-rat, and other animals of this description, is not liable to be drenched like that of other quadrupeds; and the plumage of water-fowls exhibits a similar peculiarity. The feet of many are webbed, so as to enable them to swim with great facility; and to this the general form, as in water-fowls, likewise exhibits a beautiful adaptation. The webbed feet in some, of which the habits are most thoroughly A., as seals, assume the character

of a sort of paddle, admirably fitted for use in the water, but by means of which they can only move very awkwardly on land. The forms of whales and fishes are remarkably adapted for progression in water; whilst, instead of the limbs by which other vertebrate animals are enabled to move upon the land or to fly in the air, their great organ of locomotion is the tail, or rather the hinder part of the elongated body itself, with the tail as the blade of the great oar, which all the principal muscles of the body concur to move. Remarkable provision is made in A. animals of the higher vertebrate classes for the maintenance of the requisite animal heat, by the character of the fur or plumage; a purpose which the blubber of whales also most perfectly serves. In the colder-blooded animals, where no such provision is requisite, the structure of the heart is accommodated to the diminished necessity for oxygenation of the blood; and although reptiles in their perfect state must breathe air, most of them can remain long under water without inconvenience. Fishes, and the many other animals provided with branchiae or gills, breathe in the water itself, deriving the necessary oxygen, which in their case is comparatively little, from the small particles of air with which it is mingled. They cannot subsist in water which has been deprived of air by boiling. Some A. insects carry down with them into the water particles of air entangled in hairs with which their bodies are abundantly furnished.

AQUATINTA, a mode of etching on copper, by which imitations of drawings in Indian ink, bistre, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. The process of A. has fallen into comparative disuse.

AQUA TOFANA, a poisonous liquid which was much talked of in the south of Italy about the end of the 17th c. Its invention is still a matter of dubiety, but is ascribed to a Sicilian woman named Tofana, who lived first at Palermo, but was obliged, from the attention of the authorities having been attracted to her proceedings, to take refuge in Naples. She sold the preparation in small phials, inscribed 'Manna of St. Nicholas of Bari,' there being a current superstition that from the tomb of that saint there flowed an oil of miraculous efficacy in many diseases. The poison was especially sought after by young wives that wished to get rid of their husbands. The number of husbands dying suddenly in Rome about the year 1659, raised suspicion, and a society of young married women was discovered, presided over by an old woman named Spara, who had learned the art of poisoning from Tofana. Spara and four other members of the society were publicly executed. Tofana continued to live to a great age in a cloister, in which she had taken refuge, but was at last (1709) dragged from it, and put to the torture, when she confessed having been instrumental to 600 deaths. According to one account she was strangled; but others affirm that she was still living in prison in 1730.

The A. T. is usually described as a clear, colourless, tasteless, and inodorous fluid; five or six drops were sufficient to produce death, which resulted slowly and without pain, inflammation, or fever; under a constant thirst, a weariness of life, and an aversion to food, the strength of the person gradually wasted away. It is even stated that the poison could be made to produce its effects in a determined time, long or short, according to the wish of the administrator—a notion generally prevalent in those ages respecting secret poisoning. The most wonderful

stories are told of the mode of preparing this poison; for example, the spittle of a person driven nearly mad by continued tickling was held to be an essential ingredient. Later investigations into the real nature of the A. T. lead to the belief that it was principally a solution of arsenic.

AQUA VITÆ (Lat. *water of life*) is a common term applied to ardent spirits. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life; and as Latin was the tongue employed in the conveyance of knowledge in those days, this restorer of health and prolonger of life was naturally christened A. V.

AQUEDUCT (Lat. *Aquæ ductus*), an artificial course or channel by which water is conveyed along an inclined plane. When an A. is carried across a valley, it is usually raised on arches, and where elevated ground or hills intervene, a passage is cut, or, if necessary, a tunnel bored for it. Aqueducts were not unknown to the Greeks; but there are no remains of those which they constructed, and the brief notices of them by Pausanias, Herodotus, and others, do not enable us to form any distinct notion of their character. The aqueducts of the Romans were amongst the most magnificent of their works, and the noble supply of water which modern Rome derives from the three now in use, of which two are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilisation and refinement, when nine were employed to pour water into its baths and fountains.

The following are the names of the Roman aqueducts, chronologically arranged:

1. The *Aqua Appia*, begun by and named after the censor Appius Claudius about 313 B.C. It ran a course of between 6 and 7 miles, its source being in the neighborhood of Palestrina. With the exception of a small portion near the Porta Capena, it was subterranean. No remains of it exist.

2. *Anio Vetus*, constructed about 273 B.C. by M. Curius Dentatus. It also was chiefly underground. Remains may be traced both at Tivoli and near the Porta Maggiore. From the point at which it quitted the river Anio, about 20 miles above Tivoli, to Rome, is about 43 miles.

3. *Aqua Marcia*, named after the prætor Quintus Marcius Rex, 145 B.C., had its source between Tivoli and Subiaco, and was consequently about 60 miles long. The noble arches which stretch across the Campagna for some 6 miles on the road to Frascati, are the portion of this A. which was above ground.

4. *Aqua Tepula* (126 B.C.) had its source near Tusculum, and its channel was carried over the arches of the last-mentioned A.

5. *Aqua Julia*, constructed by Agrippa, and named after Augustus 34 B.C. Like the Tepulan, it was carried along the Marcian Arches, and its source was also near Tusculum. Remains of the three last-mentioned aqueducts still exist.

6. *Aqua Virgo*, also constructed by Agrippa, and said to have been named in consequence of the spring which supplied it having been pointed out by a girl to some of Agrippa's soldiers when in search of water. The Aqua Vergine, as it is now called, is still entire, having been restored by the Popes Nicholas V. and Pius IV. 1568. The source of the Aqua Virgo is near the Anio, in the neighbourhood of Torre Salona, on the Via Collatina, and about 14 miles from Rome. The original object of this A. was to supply the baths of Agrippa; its water now

flows in the Fontana Trevi, that of the Piazza Navona, the Piazza Farnese, and the Barcaccia of the Piazza di Spagna. The water of the Aqua Virgo is the best in Rome.

7. *Aqua Alsietina*, constructed by Augustus, and afterwards restored by Trajan, and latterly by the popes. This A., now called the Aqua Paola, is situated on the right bank of the Tiber, and supplies the fountains in front of St. Peter's and the Fontana Paola on the Montorio. Its original object was to supply the Naumachia of Augustus, which was a sheet of water for the representation of sea-fights.

8. *Aqua Claudia*, commenced by Caligula and completed by Claudius, 51 A.D. A line of magnificent arches which formerly belonged to this A. still stretches across the Campagna, and forms one of the grandest of Roman ruins. It was used as a quarry by Sextus V. for the construction of the Aqua Felici, which now supplies the Fountain of Termini, and various others in different parts of the city.

9. *Anio Novus*, which was the most copious of all the Roman fountains, though inferior to the Marcia in the solidity of its structure; it was also the longest of the aqueducts, pursuing a course of no less than 62 miles. By the two last-mentioned aqueducts, the former supply of water was doubled. In addition to the aqueducts already mentioned, there was the Aqua Trajana, which may, however,

Aqua Alexandrina.

be regarded as a branch of the Anio Novus, and several others of later construction, such as the Antoniana, Alexandrina, and Jovia, none of which were to be compared with the older ones in extent and magnificence.

Nor was it for the uses of the capital alone that aqueducts were constructed. The A. of Trajan, at Civita Vecchia, which conveys the water a distance of 23 miles, and that in the vicinity of Marzana, near Verona, with others that might be mentioned, still attest the existence of aqueducts in the smaller towns of Italy in Roman times. Even during the unpromising period which succeeded, the habit of their construction was not abandoned, that of Spoleto having been built by the Lombard Duke Theodolapius in 604. The extraordinary A. by which the fountain at Siena is supplied, is said to have occupied two centuries in building; and the modern A. of Leghorn, which is not unworthy of the Roman models after which it was designed, is surpassed in magnificence by that of Pisa, with its thousand arches. In the more distant provinces which fell under the Roman power, aqueducts were likewise constructed—at Nicomedia, Ephesus, Smyrna, Alexandria, Syracuse, and in many of the towns in Gaul and in Spain. At Merida there are the remains of two aqueducts, of one of which there are thirty-seven piers still standing, with three tiers of arches. But the most magnificent structure of this

class in Spain, is the A. of Segovia, in Old Castile, for which Spanish writers claim an antiquity beyond that of the Roman dominion; but which, there is reason to believe, belongs to the time of Trajan. At Evora, in Portugal, there is likewise an A. in good preservation, with a *castellum* or reservoir at its termination in the city, consisting of two stories, the lower one being decorated with pillars. But of all the provincial aqueducts, that at Nismes, in Provence, is at once the most remarkable and the best preserved. The following description of it, which we transcribe from Mr. Murray's excellent Hand-book for France, will convey to the reader a very vivid conception not only of this A. in particular, but of the very interesting class of works to which it belongs.

'It consists of three rows of arches, raised one above the other, each smaller than the one below it; the lowest of six arches, the centre tier of eleven, and the uppermost of thirty-five; the whole in a simple if not a stern style of architecture, destitute of ornament. It is by its magnitude, and the skilful fitting of its enormous blocks, that it makes an impression on the mind. It is the more striking from the utter solitude in which it stands—a rocky valley, partly covered with brushwood and greensward, with scarce a human habitation in sight, only a few goats browsing. After the lapse of 16 c., this colossal monument still spans the valley, joining hill to hill, in a nearly perfect state, only the upper part, at the northern extremity, being broken away. The highest range of arches carries a small canal, about 4½ feet high and 4 feet wide, just large enough for a man to creep through, still retaining a thick lining of Roman cement. It is covered with stone slabs, along which it is possible to walk from one end to the other, and to overlook the valley of the Gardon. The height of the Pont du Gard is 188 feet, and the length of the highest arcade 873 feet. Its use was to convey to the town of Nismes the water of two springs, 25 miles distant. . . . The conveyance of this small stream was the sole object and use of this gigantic structure, an end which would now be attained by a few iron water-pipes.' Neither the date nor the builder of the Pont du Gard is known with certainty, but it is ascribed to Agrippa, the nephew of Augustus; a conjecture which is rendered probable by the fact of his having restored the Appian, Marcian, and Anienian, and constructed the Julian A. at Rome. The importance which the Romans attached to their aqueducts may be gathered from the fact, that special officers, invested with considerable authority, and, like all the higher officials, attended by lictors and public slaves, were appointed for their superintendence. Under the orders of these 'guardians of the waters,' we are told that, in the time of Nerva and Trajan, about 700 architects and others were employed in attending to the A. These officials were divided into various classes, and known by different names, according as their duties related to the care of the course of the A., the Castella or reservoirs at its termini, the pavement of the channel, the cement with which it was covered, and the like.

The construction of aqueducts in recent times is comparatively rare, water being now generally conveyed in pipes; but two instances are worthy of notice—the *Lisbon A.*, and the *Croton A.* at New York. The former, completed in 1738, is about 3 leagues in length; near the city, it is carried over a deep valley for a length of 2400 feet, by a number of bold arches, the largest of which has a height of 250 feet, and a span of 115. The Croton A., which conveys the waters of the Croton river for a distance of 38 miles to the city of New York, is one of the greatest undertakings of modern times. It was

commenced in 1837, and finished in 1842, and is calculated to discharge upwards of 60,000,000 gallons in 24 hours. As the magnificence of aqueducts depends upon the height and number of arches requisite to carry them across valleys, it may give some idea of that under consideration when it is stated that Haarlem River is crossed by fifteen arches, seven of which are of 50 feet span, and eight of 80 feet, the greatest height being 150 feet from the foundation to the top of the mason-work.

A'QUEOUS HUMOUR is the fluid which occupies the space in the eye between the back of the cornea and the front of the lens, which, in foetal life, is divided into an *anterior* and *posterior* chamber by the *membra pupillaris* (q. v.), and in adult life, by the iris. It consists of water, with, according to Berzelius, about a fiftieth of its weight made up of chloride of sodium and extractive matters held in solution.

Anatomists are not agreed as to the spring of this watery secretion, and are inclined to doubt the existence of a special secreting membrane, which used to be taken for granted. However, a layer of delicate epithelial cells, which exists at the back of the cornea (q. v.), is probably concerned in its formation. It is rapidly re-secreted if allowed to escape by any wound in the cornea, and in some cases is formed in such quantity as to cause dropsy of the eye (*hydrophthalmia*).

A'QUEOUS ROCKS. In Geology, every layer which forms a portion of the solid crust of the earth is called a rock, it matters not whether its particles are incoherent, like soil or sand, or compacted together, like limestone and sandstone—to all alike, irrespective of popular usage, the geologist applies the term *rock*. In this wide sense, the rocks of the earth's crust are either igneous (q. v.) or sedimentary. These sedimentary rocks have an aqueous origin, with the exception of a very limited number, like drift-sand, which are brought into their present position by the action of the wind. Unlike the igneous rocks, whose particles have assumed their present form in the position they occupy, the materials of the A. R. have evidently been brought from a distance. They owe their origin to some older rock, whose decomposition or destruction has afforded the materials. The parent rock can often be identified. Its distance is indicated by the condition of the materials, whether they are rounded and water-worn, or angular and shingly.

The agents now at work, and which have been active in past geological ages, rubbing down and transporting the materials from which these rocks are formed, are the following: 1. *The sea*, destroying the rocks and cliffs, and beaches which form its boundary, and carrying off the eroded materials to form new rocks below the level of the sea. 2. *Rivers*, including the action of their smallest tributary rills, and even of the drops of rain, for these abrade and carry off the almost imperceptible particles from the surface where they fall; and when united, they form the rill with its suspended sediment, and these again unite to form the river, which in its course not only retains what it has got, but scoops up more from its own bed, and carries all to the sea or lake, to deposit it there as a new stratum. It is difficult to estimate the influence of this agency. Sir Charles Lyell calculates that the Nile annually deposits in the Mediterranean 3,702,758,400 cubic feet of solid matter. 3. *Glaciers and icebergs*. These enormous moving masses of ice are not only loaded with rock-fragments, which are deposited as the ice melts, but are ever abrading the rocks over which they pass, and thus supply materials to form new layers. 4. Several stratified rocks have an evidently

organic origin, such as chalk, and some limestones chiefly composed of animal remains, and coal consisting of vegetable carbon; but even these have been influenced in their formation by water so much as to justify us in classifying them with A. R. 5. The same remark applies to rocks which have been *precipitated from a fluid* with which the materials existed in chemical combination, as has been the case with beds of salt, gypsum, and calcareous tufa.

As the result of these various actions, we have a series of rocks which, from their composition, may be classed as Arenaceous, Argillaceous, Calcareous, Carbonaceous, Saline and Silicious. We must refer to these terms for the descriptions of the various rocks included under them.

The arrangement of the A. R. depending on their different ages, is of more importance in modern geology than that depending on their internal constitution. When a section of the earth's crust is examined, it is found to be composed of a series of layers which have been produced in succession. Comparing this with sections in other districts, it is noticed that there is a regularity in the several parts; for beds of the same structure are found in different localities, and these occupy the same relative position to the adjacent beds. A number of observations have shewn that the crust of the earth is composed of a *regular* series of earthly deposits formed one after another, during successive periods of time. This general induction forms the basis of the following classification. For the description of the included strata we must again refer to the names of the different divisions:

I. TERTIARY OR KAINOZOIC EPOCH—1. Superficial Deposits or Recent Period; 2. Pleistocene Period; 3. Pliocene or Upper Tertiary Period; 4. Miocene or Middle Tertiary Period; 5. Eocene or Lower Tertiary Period.

II. SECONDARY OR MESOZOIC EPOCH—6. Cretaceous Period; 7. Oolitic Period; 8. Triassic Period.

III. PRIMARY OR PALÆOZOIC EPOCH—9. Permian Period; 10. Carboniferous Period; 11. Devonian or Old Red Sandstone Period; 12. Silurian Period; 13. Cambrian Period.

AQUIFOLIA'CEÆ, a natural order of dicotyledonous or exogenous plants, of which the common holly (q. v.) is the best known example, and the only species that is a native of Europe. The order, however, contains more than one hundred species, the greater part of which are natives of America, and many of them belong to the tropical and subtropical parts of it. The species are all evergreen trees or shrubs, with simple, leathery leaves, and without stipules. The flowers are small and axillary, with 4—6 sepals, and a 4—6-parted corolla, into which the stamens are inserted, alternating with its segments. The ovary is fleshy and superior, with two or more cells, a solitary anatropal pendulous ovule in each cell, the cells generally becoming bony as distinct stones in the fruit, which is fleshy. The order is allied to *Rhamnaceæ*, *Celastraceæ*, and *Ebenaceæ*. The most interesting species belong to the genus *Ilex*, or HOLLY (q. v.).

AQUILA. See EAGLE.

A'QUILA, the capital of the Neapolitan province called Abruzzo Ultra, situated on the Pescara, near the loftiest of the Apennines, with a population of 10,000, ranks as a fortified town of the fourth class, though its citadel is its only strong point. A. was built by the emperor Frederic II. from the ruins of the ancient *Amitemnum*, a town of the Sabines, and the birthplace of Sallust the historian. In 1703 it was almost destroyed by an earthquake, in which 2000 persons perished. A. is a bishop's see, has civil and criminal courts, and

a Lyceum, and is considered one of the best built towns in the kingdom. In 1841, much political disturbance took place here, and several of the inhabitants were imprisoned and executed in consequence. Altogether, public feeling in this town and province is far more liberal than in most other parts of the kingdom.

AQUILA, PONTICUS, a celebrated translator of the Old Testament into Greek, born at Sinope. He flourished about the year 180 A.D., is said to have been a relation of the Emperor Hadrian, and to have been first a Pagan, then a Christian, and finally a Jew; submitting in his last conversion to the peculiar religious ceremony of circumcision. His translation of the Old Testament—which appears to have been undertaken for the benefit of his Hellenised countrymen—was so *literal*, that the Jews preferred it to the Septuagint, as did also the Judaising sect of Christians, called Ebionites. Only a portion of the work remains, which has been edited by Montfaucon and others.

AQUILARIA/CE/E, a natural order of dicotyledonous or exogenous plants, containing only about ten known species, all of which are trees with smooth branches and tough bark, natives of the tropical parts of Asia. The leaves are entire; the perianth leathery, turbinate, or tubular, its limb divided into four or five segments; the stamens usually ten; the filaments inserted into the orifice of the perianth; the ovary two-celled, with two ovules; the stigma large; the fruit a 2-valved capsule, or a drupe. The order is chiefly interesting as producing the fragrant wood called **ALOE** Wood (q. v.).

AQUILEGIA See **COLUMBINE**.

AQUILEJA or **AGLAR** (earlier, *Velia* or *Aquila*), is a town in Austrian Italy, at the head of the Adriatic, 22 miles W. N. W. of Trieste. Pop. 1480. It is now sunk in utter insignificance, possessing no trade or public buildings of any note, except its cathedral; but in the time of the Roman emperors, it was one of the most important places north of the metropolis. Its commerce was flourishing, for though 8 miles distant from the sea, vessels could reach it by canals connecting it with the rivers in its vicinity. It was both the central point of the transit-trade between the north and south of Europe, and the key of Italy against the barbarians. Founded by a Roman colony in 181 B.C., it became a favourite residence of Augustus; and in 168 A.D. was so strongly fortified by Marcus Aurelius, as to be considered the first bulwark of the empire on the north. It was called *Roma Secunda*, the Second Rome. Here the Emperor Maximin perished; and in the vicinity Constantius lost his life in a battle against his brother Constans. When the town was destroyed by Attila in 452, it had 10,000 inhabitants. It never recovered, although it received some ecclesiastical honours, but has continued slowly dwindling down through all the centuries into deeper obscurity and wretchedness. Councils were held at A. in 381, 558, 698, and 1184 A.D.

AQUINAS, THOMAS, or **THOMAS OF AQUINO**, one of the most influential of the scholastic theologians, was of the family of the Counts of Aquino, in the kingdom of Naples, and was born in the Castle of Rocca Secca, in 1224. He received the rudiments of his education from the Benedictine monks of Monte-Casino, and completed his studies at the university of Naples. A strong inclination to philosophical speculation determined the young nobleman, against the will of his family, to enter (1243) the order of Dominicans. In order to frustrate the attempts of his friends to remove him from the convent, he was sent away from Naples, with the view

of going to France; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q. v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope. At Cologne he pursued his studies in such silence, that his companions gave him the name of the 'Dumb Ox.' But Albert, his master, is reported to have predicted, 'that this ox would one day fill the world with his bellowing.' Thoroughly imbued with the scholastic, dialectic, and Aristotelian philosophy, he came forward, after a few years, as a public teacher in Paris. His masterly application of this philosophy to the systematising of theology, soon procured him a distinguished reputation. It was not, however, till 1257, that A. obtained the degree of doctor, as the university of the Sorbonne was hostile to the mendicant monks. He vindicated his order in his work, *Contra Impugnantes Dei Cultum et Religionem*; and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued to lecture with great applause in Paris, till Urban IV., in 1261, called him to Italy to teach philosophy in Rome, Bologna, and Pisa. Finally, he came to reside in the convent at Naples, where he declined the offer of the dignity of archbishop, in order to devote himself entirely to study and lecturing. Being summoned by Gregory X. to attend the General Council at Lyon, he was surprised by death on the way, 1274, at Fossanuova, in Naples. According to a report, he was poisoned at the instigation of Charles I. of Sicily, who dreaded the evidence that A. would give of him at Lyon.

Even during his life A. enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the 'Universal,' the 'Angelic Doctor,' and the 'Second Augustine.' A general chapter of Dominicans in Paris made it obligatory on the members of the order, under pain of punishment, to defend his doctrines. It was chiefly the narratives of miracles said to have been wrought by A. that induced John XXII., in 1323, to give him a place among the saints. His remains were deposited in the convent of his order at Toulouse. Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his writings display a great expenditure of diligence and dialectic art, set off with the irresistible eloquence of zeal. His chief works are—a *Commentary on the Four Books of Sentences of Peter Lombard*, the *Summa Theologicæ Questiones Disputatæ et Quodlibetales* and *Opuscula Theologica*. He gave a new and scientific foundation to the doctrine of the church's treasury of works of supererogation, to that of withholding the cup from the laity in the communion, and to transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the 'Father of Moral Philosophy.' The definiteness, clearness, and completeness of his method of handling the theology of the church, gave his works a superiority over the text-books of the earlier writers on systematic theology. His *Summa Theologicæ* is the first attempt at a complete theological system. Accordingly, Pius V., to whom we owe the publication of the complete collection of A.'s works (18 vols., Rome, 1570; a newer but less trustworthy ed., 23 vols., Paris, 1836—41), ranks him with the greatest teachers of the church. In his philosophical writings,

the ablest of which is his *Summa Fidei Catholice contra Gentiles*, he throws new light over the most abstract truths. The circumstance of A. being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the 14th c., Duns Scotus (q. v.), a Franciscan, came forward as the declared opponent of the doctrines of A., and founded the philosophico-theological school of the Scotists, to whom the *Thomists*, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to Nominalism (q. v.), although they held the abstract form to be the essence of things; they followed the doctrines of Augustine as to grace, and disputed the immaculate conception of the Virgin. The Scotists, again, inclined to Realism (q. v.), and to the views of the Semipelagians, and upheld the immaculate conception.

AQUITA'NIA, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes. Augustus, when he divided Gaul into four provinces, added to A. the country lying between the rivers Garonne and Loire. Afterwards, A. passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Though subjugated by Charlemagne, the duchy again claimed independence under the weak monarchs of the Carolingian dynasty. In 1137, it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of A. In 1152, A. became an English possession through the marriage of Henry II. with Eleanor, whom Louis had divorced, and a long series of disputes took place between England and France respecting A., which was at length ultimately united to the crown of France by Charles VII. in 1451.

ARABESQUE (Fr.), means merely *after the Arabian manner*; and, so far as etymology is concerned, might therefore be general in its application. In practice, however, it is used to characterise a peculiar kind of fantastic decoration commonly employed in conjunction with architecture, and which the

Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now applied, was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in enriching their monumental decorations. But the A. of the Moors differed from that of the Egyptians in entirely excluding the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confining itself entirely to the foliage, flowers, fruit, and tendrils of plants and trees, curiously and elaborately intertwined. This limitation of the field of A. was again departed from when the decorations were discovered on the walls of the baths of Titus,

Arabesque Panel.
From the Mosque
at Cordova.

in the time of Leo X.; and more recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern A. consists usually of combinations of plants, birds, and

animals of all kinds, including the human figure, and embracing not only every natural variety, but stepping without hesitation beyond the bounds of nature. The freedom with which it admits the fantastic is, indeed, the leading peculiarity of A.; and as it is found in some form amongst every people who have attempted to give a visible representation of their fancies, it is spoken of by F. Schlegel as 'the oldest and original form of fancy.' The arabesques with which Raphael adorned the galleries of the Vatican, and which he is said to have imitated from those which he had been instrumental in discovering in the baths of Titus, are at once the most famous and the most beautiful which the modern world has produced. Arabesques are usually painted, though the term is also applied to sculptural representations of similar subjects in low relief.

ARABIA—called by the inhabitants, *Jezirat-al-Arab* (the peninsula of A.); by the Turks and Persians, *Arabistan*—is the great south-western peninsula of Asia, and is situated 12° 40'—34° N. lat., and 32° 30'—60° E. long. Its length from N. to S. is about 1500 miles; its breadth, about 800; its area, 1,200,000 square miles; and its population is roughly estimated at 8,000,000. It is bounded on the N., by Asiatic Turkey; on the E., by the Persian Gulf and the Gulf of Oman; on the S., by the Gulf of Oman and the Indian Ocean; and on the W., by the Red Sea. It is connected with Africa on the N. W. by the Isthmus of Suez. Through the centre of the land, between Mecca and Medina, runs the tropic of Cancer. The name A. has been derived by some from *Araba* (which means a level waste), a district in the province of Tehama; by others, from *Eber*, a word signifying a nomad ('wanderer'), as the primitive Arabs were such. This would connect it with the word Hebrew, which has a similar origin. Others, again, are inclined to derive it from the Hebrew verb *Arab*, to go down—that is, the region in which the sun appeared to set to the Semitic dwellers on the Euphrates. There is also a Hebrew word, *Arâbah*, which means 'a barren place,' and which is occasionally employed in Scripture to denote the border-land between Syria and Arabia. Ptolemy is supposed to be the author of the famous threefold division into *Arabia Petraea*, *Arabia Felix*, and *Arabia Deserta*—the first of which included the whole of the N. W. portion; the second, the west and south-west coasts; and the third, the whole of the dimly-known interior. This division, however, is not recognised by the natives themselves, neither is it very accurate as at present understood, for *Petraea* was not intended to mean rocky or stony. Ptolemy formed the adjective from the flourishing city of Petra (the capital of the kingdom of the Nabathæans), whose proper name was *Thamud*—that is, the rock with a single stream. The word *Felix*, also, arose from an incorrect translation of Yemen, which does not signify 'happy,' but the land lying to the right of Mecca—as *Al-Shan* (Syria) means the land lying to the left of the same. The divisions of the Arab geographers are as follows—1. *Bahr-el-Tour Sinai* (Desert of Mount Sinai); 2. The *Hedjaz* (Land of Pilgrimage); 3. *Tehama* and *Yemen*, along the Red Sea; 4. *Hadramaut*, the region along the southern coast; 5. *Oman*, the kingdom of Muscat; 6. *Bahrein*, on the Persian Gulf; 7. *Nedjed* the central desert region.

Our knowledge of the interior of A. is still very imperfect in detail, but its general characteristics are decidedly African. The largest portion of it lies in that great desert zone which stretches from the shores of the Atlantic to those of the Northern Pacific. The interior, so far as it has yet been explored by Europeans, seems to be a great plateau,

in some places reaching a height of 8000 feet. The western border crest of this plateau may be regarded as part of a mountain-chain, beginning in the north with Lebanon, and stretching south to the Straits of Bab-el-Mandeb. From Bab-el-Mandeb another chain runs north-east, parallel to the coast to Oman. From the mountain-range on the west, the plateau slopes to the north-east, and forms, in general, a vast tract of shifting sands, interspersed here and there about the centre with various ranges of hills, which, like the shores of the peninsula, are generally barren and uninteresting.

A. has, on the whole, an African climate. Though surrounded on three sides by the sea, its chains of hills exclude in a great measure the modifying influence of currents of air from the ocean. In several parts of A. hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown: in other sultry districts, the date-palm is almost the only proof of vegetable life. Over large sterile tracts hangs a sky of almost eternal serenity. The short rainy season which occurs on the west coast, during our summer months, fills periodically the *wadis* (hollow places) with water, while slight frosts mark the winters in the centre and north-east. During the hot season, the simoom (q. v.) blows, but only in the northern part of the land. The terraced districts are more favourable to culture, and produce wheat, barley, millet, palms, tobacco, indigo, cotton, sugar, tamarinds, excellent coffee, and many aromatic and spice-plants, as balsam, aloe, myrrh, frankincense, &c. A. is destitute of forests, but has vast stretches of desert grass fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product both of A. and Africa.

In the animal kingdom, an African character prevails generally. Sheep, goats, and oxen satisfy the immediate domestic and personal necessities of the inhabitants, to whom the camel and horse are trusty companions in their far wanderings. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, where flights of locusts often make sad devastation. Fish and turtle abound on the coast. The noble breed of Arabian horses has been cultivated for several thousand years; but the most characteristic of all animals in the peninsula, is the camel, which has been both poetically and justly styled 'the ship of the desert.' It may be regarded as an Arabian animal, for it seems to be proved that it is not a native of Africa, but has migrated from the peninsula with its master. The camel is not found among the figures of animals in the ancient Egyptian paintings on walls, nor does it appear to have been known to the Carthaginians. The breed of Oman is celebrated for its beauty and swiftness. Among the minerals of A. may be mentioned—iron, copper, lead, coal, basalt, and asphaltum, and the precious stones, emerald, carnelian, agate, and onyx. Pearls are found in the Persian Gulf.

But the most interesting features of the peninsula are found in its ancient and peculiar population. The Arab is of medium stature, muscular make, and brown complexion. Earnestness and lofty pride look out of his glowing eyes; by nature he is quick, sharp-witted, lively, and passionately fond of poetry. Courage, temperance, hospitality, and good faith, are his leading virtues; but these are often marred by a spirit of sanguinary revenge and rapacity. His wife keeps the house and educates the children. The Arab cannot conceive a higher felicity than the birth of a camel or a foal, or

that his verses should be honoured with the applause of his tribe.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouins, are well known to entertain very loose notions of the rights of property. The located tribes, styled Hadesi and Fellahs, are despised by the Bedouin, who scorns to be tied down to the soil, even where such bondage might make him wealthy. As Ritter in his Comparative Geography observes—Arabia 'is the anti-industrial central point in the world;' for on every side, branching out to the east or west, we find industry making progress, while here centuries pass away without any improvement save what has been introduced, almost compulsorily, by foreigners. The trade carried on by exports of coffee, dates, figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa, or when Aden was in its prime and the Red Sea was the great commercial route. A. has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities. Few nations have approached so near as the Arabs to the condition of standing still in a moral and social point of view. Considering how little progress has been made, it is remarkable that a greater degeneracy has not taken place. Even in the desert the children are taught to read, write, and calculate; and in the towns, education to a certain degree is general. The division of the people into so many tribes is a barrier to everything like a great national improvement; indeed, the world national can hardly be properly applied to the Arabs. It would require a series of extraordinary events to develop afresh that terrible unity which Mohammed gave A. for a time. The government is patriarchal, and the chief men of the various tribes have the title of Emir, Sheik, or Imaum. Their function appears limited to leading the troops in the time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

To number all the distinct states of A. would be impossible in the present state of our knowledge; but the seven great divisions are those which we have enumerated. Of these, the most important are Yemen and Oman, the former of which has its seat of government at Sana, in the centre of the country, and also possesses two very important commercial towns, Mocha and Loheia, situated on the coast of the Red Sea, while the latter has of late made considerable advances in civilisation. It forms to some extent an exception to the general lack of manufacturing activity exhibited by the Arabians, having manufactures of silk and cotton turbans, sashes, canvas, arms, gunpowder, &c. The Imaum of Muscat—the largest town on the south-east coast—is by far the most liberal and powerful native sovereign in Arabia, and claims authority over the whole of Oman, the islands in the Persian Gulf, a portion of the Persian coast, and a vast extent of territory on the east coast of Africa, including some valuable islands. Rostak is another large town inland from Muscat. The district or division of Hedjaz contains the holy cities of Mecca and Medina, with their seaports, Jeddah and Yambo, all of which will be described in their proper places.

The *History of Arabia*, before the time of Mohammed, is involved in mystery, and has little interest, on account of its want of connection with the world's general progress. The aborigines of A. were probably Cushites, most of whom, on account of the hostile immigration of certain Semitic races,

descended from Joktan, grandson of Shem, passed over into Abyssinia. A few, however, remained, who inhabited the western coasts. Subsequently, another Semitic race, descended from Abraham, settled in the land. The oldest Arabian tribes are now extinct, and only a traditional memory even of their names exists; but the Semitic chiefs, Joktan or Kahtan, and Ishmael, are generally considered to be the fathers of the present inhabitants. The descendants of the former are the pure Arabs; those of the latter are held to be only Arabised. The princes of A. belong wholly to the first. A great-grandson of Joktan, Himzar or Homeir, inaugurated a dynasty—the Himyarides or Homeritæ—which ruled in Yemen for upwards of 2000 years. This was a prosperous time. The Arabs of Yemen, and partly those of the desert, dwelt in towns and cultivated the soil; carried on commerce with the East Indies, Persia, Syria, and Abyssinia, in the last of which countries they planted numerous colonies. The rest of the people, however, lived nomadically, as now. Bravely, for thousands of years, they maintained their freedom, their faith, and their peculiar customs against the assaults of the great military empires. Neither the Babylonian and Assyrian, nor the Egyptian and Persian kings could reduce the Arabs to a state of subjugation. Alexander had determined to try his power against A., when death interrupted his plans. Three centuries after Alexander's death, the Romans had extended their empire to the borders of A., and Trajan, in 107 A. D., penetrated far into the interior; but though the northern chieftains were brought into a formal subjection to the empire, A. was not made a Roman province. The old Himyarides in Yemen stoutly maintained their independence, and an expedition against them in the time of Augustus completely failed. With the decay of the Roman empire, strife and lawlessness increased. The Arab races continued in a scattered, disorganized condition, and many hundreds of years passed away in intestine wars, during which the central highland region was the scene of those feuds of the Arab clans so copiously sung by the native poets. Christianity found an early entrance into A. The Jews, in considerable numbers, migrated into A. after the destruction of Jerusalem, and made many proselytes, especially in Yemen. This diversity of creeds in the peninsula was favourable to the introduction of the doctrine of Mohammed, which forms the grand epoch in Arabian history, and brings it into close connection with the general history of civilisation. Now, for the first time, the people of A. became united, and powerful enough to erect new empires in the three quarters of the world. The dominion of the Arabs, from the time of Mohammed to the fall of the Califat of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilisation. (See the articles *MOORS*, *CALIFS*.) But the movements which had such great effects on the destinies of other nations, produced but little change in the interior of A.; and, after the brilliant career of conquest was ended, the peninsula was left in an exhausted condition. Then followed the subjugation of Yemen by the Turks in the sixteenth century; their expulsion in the seventeenth century; the dominion of the Portuguese over Muscat, 1508—1659; the conquests of Oman and the temporary victories gained by the Persians at the close of the sixteenth century; and, lastly, the appearance of the Wahabis (q. v.) (1770), whose moral influence is still felt. The latter took an important part in the political affairs of A., but their progress was interrupted by Mehemet Ali, the Pasha of Egypt, who subjugated the coast-country of Hedjaz, with some parts of the coast of Yemen, and

in 1818 gained a decisive advantage through the victory of Ibrahim Pasha. The subsequent events of the year 1840, in Syria, compelled Mehemet, however, to concentrate his forces, and to resign all claims upon territories lying beyond the boundary-line drawn from the Red Sea to the Gulf of Akaba.

ARABIAN ARCHITECTURE. So inseparable is the connection between architecture and religion, that it may be stated as a general rule that no sooner is a new religion engendered than it finds expression in new architectural forms. Of this we have an interesting instance in the simultaneous rise of Mohammedanism, and of the style of architecture commonly called Arabian, or Moorish, but to which the name of Mohammedan might far more appropriately be given, seeing that it has everywhere followed the religion of the Crescent, and that the Arabians previously had no architecture peculiar to themselves. It is further remarkable that the style of which we speak seems to have arisen, as it were, undesignedly, or, at all events, without any conscious effort on the part of the people amongst whom it first appeared. The followers of the Prophet contemplated nothing peculiar in their ecclesiastical structures; and at first their mosques were built by Christian architects from Constantinople. As a natural consequence, they resembled Byzantine churches, modified in the

Moorish Gateway.

countries of which the Moors successively possessed themselves by the features of the existing churches. Gradually the new and fanciful ornamentation known as Arabesque (q. v.) was added to the recognised features of Greek and Roman edifices. The exclusion of animal figures, which their abhorrence of the very appearance of idolatry necessitated,

confined the Mohammedan artists to the imitation of vegetable productions, varied by geometrical patterns and inscriptions, of which the letters were woven into forms which suited them for architectural uses. But the most original feature in their edifices, and that by which they have continued to be marked from all others, is the horse-shoe arch. The example in the illustration presents a form which, notwithstanding its extreme beauty, has strangely enough scarcely ever been imitated in the Christian church. The pointed arch, on the other hand, and the various forms of the trefoil and quatrefoil arches, though there can be little doubt that we are indebted for them to the rich invention of the Moorish architects, have become so entirely Christian as to be no longer associated in our minds with the religion of the prophet. It is said that the pointed arch is to be found in Mohammedan buildings so early as 780 A.D. (Parker's *Glossary of Architecture*), whereas the earliest examples of its use in Christian architecture belong to the 12th c. Moorish architecture probably reached its highest point of development in the Alhambra, with the characteristics of which the English public have been made familiar by means of the court which bears its name in the palace at Sydenham.

ARABIAN GULF. See RED SEA.

ARABIAN LANGUAGE AND LITERATURE.

Regarding the oldest literary culture of the Arabians, we possess but slight information. That their poetry at least must have had a very early development, may be inferred from the natural disposition of the inhabitants, who were characterised for their high spirit, courage, love of adventure, and delight in the glory of war. As far back as Solomon's time, the queen of Sheba (probably *Arabia Felix*) was noted for her sententious sayings. The nomadic tribes, living under the patriarchal rule of their sheiks, possessed everything that was favourable to the growth of a simple and natural poetry. They had quick and vivid feelings, and a rich, glowing fancy, which, operating upon the perils, the hardships, and strange confederate life they led in those barren sand-deserts, and amongst naked rocks, could hardly fail to call forth a wild and vigorous minstrelsy. Before the time of Mohammed, the Arabians had celebrated poets who sang the feuds of tribes, and the praises of heroes and fair women. During the great fairs at Mecca and Okadh, poetic contests were held before the people as at the Grecian games; and the poems to which the prize was awarded, were re-written in golden characters, and suspended in the Kaaba at Mecca, the venerable national temple which the Mohammedans affirm to have been built by Abraham, or Ishmael. They are termed the *Moallakât*—i. e., 'the Suspended'—from the honour conferred on them, and are remarkable for their pathos, soaring conceptions, richness of imagery and phraseology, free and unconstrained spirit, and the glow of their love and hate. Among the famous poets of this early period are Nabegha, Asha, Shanfara—whose works were translated and published by De Sacy in his *Chrestomathie Arabe*—and, lastly, Kaab-ben-Zohair, who lived to celebrate the praises of the prophet Mohammed.

But the most brilliant period of Arabic culture is that which Mohammed himself inaugurated in the Koran. His new doctrines of faith and life, collected under this title by the first calif, Abubekr, were revised and published by Othman, the third calif. The naturally adventurous spirit of the Arabs found a suitable excitement in the half-religious, half-military system of Mohammed, and, after his death, their fanaticism prepared them for their subsequent career. Like an overwhelming torrent, they passed

over the neighbouring states, and in the short space of eighty years from the death of their prophet, had extended their dominion from Egypt to India, and from Lisbon to Samarcand. During this time nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, by their intercourse with civilised nations, the Arabian conquerors were themselves subjected to the humanising influence of letters, and, after 749 A.D., or during the reign of the Abassides, literature, arts, and sciences appeared, and were generously fostered under the splendid sway, first of Almansor (754—775), and afterwards of the celebrated Harun-al-Raschid (786—808). Learned men were now invited from many countries, and remunerated for their labours with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The Calif Al-Mamun, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give instruction to the former. There are few instances of such a price offered for lessons in philosophy. Under the sway of the same Al-Mamun, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivalled the literary fame of Bagdad, and, generally, in the 10th c., the Arabs appeared everywhere as the preservers and distributors of knowledge. Pupils from France, and other European countries, then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were fourteen academies, with many preparatory and upper schools in Spain, and five very considerable public libraries; that of the Calif Hakem containing, as is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shews a rapidity of progress in knowledge almost as remarkable as the career of Arabian conquest.

In geography, history, philosophy, medicine, physics, and mathematics, the Arabians rendered important services to science; and the Arabic words still employed in science—such as algebra, alcohol, azimuth, zenith, nadir, with many names of stars, &c.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. In Africa and Asia, the boundaries of geographical science were extended, and the old Arab treatises on geography and works of travels in several countries by Abulfeda, Edrisi, Leo Africanus, Ibn Batuta, Ibn Foslan, Ibn Jobair, Albiruni the astronomer, and others, are still interesting and valuable.

History was also studiously cultivated. The oldest Arabic historian of whom we know is Mohammed-al-Kelbi (died in 819). About the same period, however, flourished several other historians. After the dawn of the 10th c., history became a favourite study of the Arabs. The first who attempted a universal survey of the subject were Masudi, Tabari, Hamza of Ispahan, and Eutychiuss, the Christian patriarch of Alexandria. Masudi's work is entitled *Meadows of Gold and Mines of Gems*. These were followed by Abulfaraj and George Elmakin (both Christians), Abulfeda, and others. Nuvairi wrote a *History of Sicily under the Government of the Arabs*. Various sections of Arabic histories relating to the Crusades have been translated into French. On the dominion of the Arabs in Spain, several works were written by Abul-Kasem of Cordova (died in 1139), Temini,

and others. For extended notices we may refer the student of Arabic Literature to the translations by Quatremere and others; but especially to the *Encyclopädischen Uebersicht der Wissenschaften des Orients*, by Von Hammer (2 vols. Leip. 1804).

Arabian theology and jurisprudence are intimately connected, and both founded on the Koran; but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Ommaïade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence, the vague statements of the Koran were soon variously interpreted, and a host of sects gradually arose. Of these, four only are regarded as orthodox, leaving not less than seventy-two heretical, whose discordant tenets are stated in the work of Sharistani (edited by Cureton, London, 1842). The four orthodox sects are: the Hanefites, who do not reject tradition, but subordinate it to rationalism; the Shafites, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Malechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Koran. The interpretation of the Koran constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Samakhshari and Baidhawi. The conquest of Algiers has rendered the study of Arabic or Mohammedan law indispensable to the French. The result is, that several most important works on that subject have appeared of late from the Paris press, such as *Précis de Jurisprudence Musulmane, selon le Rite Malechite par Khalil-Ibn-Ishah* (translated by Perron, Paris, 1848), and *Législation Musulmane Sunnite, Rite Hanéfi* (Paris, 1848).

Arabian philosophy, which was of Grecian origin, held the same relation to the Koran as the Scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all Western Europe, through translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: Alkendi of Basra, who flourished about the beginning of the 9th c.; Alfarrabi, who wrote a work on First Principles in 954; Avicenna (died 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany; Ibn-Yahya, who acquired a high reputation as an original thinker; Alghazali (died 1111), who wrote a book entitled *The Destruction of all Idolatrous Philosophical Systems*; Abubekr-ibn-Tofail (died 1190), who taught in his philosophical novel *Hai-ebn-Yokdan* (edited by Pococke, Oxford, 1671) the development of men from animals; and his pupil, Averrhoes, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Ecoles Philosophiques chez les Arabes*, &c., by Schmolders (Paris, 1842), and Ritter's *Ueber unsere Kenntniss der Arab. Philosophie* (Gött. 1844).

Many of these illustrious Arabian philosophers were also physicians. The great skill which the Arabs acquired in their knowledge of the uses and properties of medicinal herbs, is traced by Humboldt to their geographical position. The southern part of Arabia 'is characterised by the highly developed vital force

pervading vegetation, by which an abundance of aromatic and balsamic juices is yielded to man from various beneficial and deleterious substances. The attention of the people must early have been directed to the natural products of their native soil, and those brought as articles of commerce from the accessible coasts of Malabar, Ceylon, and Eastern Africa. Hence arose the wish to distinguish carefully from one another these precious articles of commerce, which were so important to medicine, manufacture, &c. . . . The science of medicine, when considered with reference to its scientific development, is essentially a creation of the Arabs, to whom the oldest, and, at the same time, one of the richest sources of knowledge—that of the Indian physicians—had been early opened. Chemical pharmacy (see ALCHEMY) was created by the Arabs, whilst to them are also due the first official prescriptions regarding the preparation and admixture of different remedial agents—the dispensing recipes of the present day. These were subsequently diffused over the south of Europe by the School of Salerno' (Humboldt's *Cosmos*, vol. ii. p. 581, Bohn's translation). Pharmacy and *materia medica* naturally led to botany and chemistry. For three centuries—from the 8th to the 11th—a rich scientific culture prevailed. Schools of philosophy and medicine sprung up at Jondisabur, Bagdad, Ispahan, Firuzabad, Bokhara, Kufa, Basra, Alexandria, Cordova, &c. In all departments of medical science a great advance was made, except in anatomy. The reason of this exception lies in the fact, that the Koran forbids the dissection of bodies. The most famous writers on medicine are Aharun, Alkendi, Avicenna (q. v.), who wrote the *Canon of Medicine*, for a long time the only handbook on the subject; Ali-ben-Abbas, Ishak-ben-Soleiman, Abulkasem, Averrhoes (q. v.), who wrote a complete system of medicine; Ali-ben-Isa, &c.

In Mathematics, the Arabs made great advances by the introduction of the numerals and mode of notation now in use, of the sine instead of the chord (in trigonometry), and of a more extended application of algebra. Astronomy was zealously studied in the famous schools and observatories of Bagdad and Cordova. Alzahan wrote upon optics; Nassereddin translated the Elements of Euclid; Jeber-ben-Affa furnished a commentary on the trigonometry of Ptolemy, &c. The *Almagest* or System of Astronomy by Ptolemy, was translated into Arabic by Albazi and Sergius as early as 812. In the 10th c., Albaten observed the advance of the line of the apsides in the earth's orbit; Mohammed-ben-Jeber-al-Batani, the obliquity of the ecliptic; Alpetragius wrote a theory of the planets; and Abul-Hassan-Ali, on astronomical instruments.

Besides these advances in the solid branches of knowledge, the genius of the Arabs continually flowered into poetry. Numerous poets sprung up in all lands where the children of the desert had carried their irresistible faith. Their verse, however, was not like the rude, simple minstrelsy of a purely patriarchal people; it gradually allied itself to the prevailing culture, and took, especially in the golden epoch of Arabian civilisation, a highly artistic form. Motenebbi, Abul-Ala, and others acquired a great reputation for their delicate Idylls; Busiri, for his eulogy of Mohammed; Hamadani, as the first to introduce novels in verse (of which he wrote 400 under the title of *Makâmâl*), a style of literature which was brought to perfection by Hariri; Azzeddin, for his ingenious allegorical poem, 'The Birds and the Flowers.' Besides these, a singularly wild and fantastic prose literature made its appearance, in which the craving for the wonderful and gorgeous, so characteristic of the restless, adventure-loving Arabs, was richly gratified. Romances and legendary tales

abounded. The most famous of these are: *The Arabian Nights' Entertainments* (q. v.), *The Exploits of Antar*, *The Exploits of the Champions*, and *The Exploits of the Hero*. In fact, with the exception of the drama, there was no sort of poetry which the Arabs did not attempt. The effect of this universality and richness in Arabic literature was, that it exercised a powerful influence on modern European poetry. The tales of fays, charms, sorceries, and the whole gorgeous machinery of enchantment passed into the poetry of the West. During the middle ages of European history, several of the most popular and widely-spread books were of Arabic origin; such as, *The Seven Wise Masters*, and *The Fables of Bidpai*, though the Arabians themselves borrowed largely from the Persian stories and the Greek fables.

All this culture of the early ages of Mohammedanism presents a strong contrast to the ignorance which now prevails among the Arabs. The brutal fanaticism of the Turks nipped the blooming promise of the East; sunk in stupid indolence, the peoples await in apathetic resignation their deliverance and return to higher modes of life. Literature furnishes now nothing worthy of notice. Learning spends itself principally in commentaries and scholia, in scholastic discussions on the subject-matter of dogmatics and jurisprudence, and in tedious grammatical disquisitions concerning the old Arabic speech, generally acute and subtle, but always unprofitable and unenlivening. The swift and mobile genius of the East has departed, and pedantic dullness has usurped its place. There are 'Dryasdusts,' even in the desert. A few modern writers have attempted, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned, Michael Sabbagh of Syria (*La Colombe Messagère*, Arabic and French, Paris, 1805); the Sheik, Refaa of Cairo (*The Broken Lyre*, Paris, 1827; *Manners and Customs of the Europeans*, Cairo, 1834; *Travels in France*, Cairo, 1825); and Nasif-Effendi, of Beirut, who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leipsic, 1848).

The Arabic also possesses a Christian and Jewish literature, which, however, is chiefly ecclesiastical. Its principal ornaments are Eutychius, Elmakin, and Abulfaraj. Translations of the Old Testament were made not from the Hebrew, but from the Septuagint, or from Latin versions. In the middle ages, the Spanish Jews employed Arabic for their learned compositions; and several of the most important works of Moses Maimonides, &c., were originally written in that tongue.

The Arabic language, it has been remarked, is at once both *rich* and *poor*. It is necessarily destitute of innumerable words describing those ideas and objects which only civilisation can develop or produce; but, on the other hand, the rich and nimble fancy of the Arabians has multiplied, to an almost incredible extent, the synonyms of their desert-tongue, so that in some cases several hundreds of expressions are found for the same thing. The Arabic belongs to the so-called Semitic family of languages, among which it is distinguished for its antiquity and soft flexible grace. It is divided into two dialects—a northern and southern. The former, through the instrumentality of the Koran, became the predominant language of literature and commerce throughout the whole extent of the Arabian dominions; the latter, called the Himyarite, although in all probability the source of the Ethiopic language and writing, is known as yet only by a few inscriptions, &c. The earliest Arabic grammarian is Abul-Aswad-al-Duli, who flourished under the fourth calif, Ali. The first who reduced the prosody and metre of the

Arabian poets to a system, was Khalil-ben-Ahmed-al-Ferahidi of Barsa. Al-Jauhari, who died in 1009 A. D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Siha* ('Purity'), and which is held in high estimation to this day. Mohammed-ben-Yakub-al-Firuzabadi, who died in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kamus* ('The Ocean'), which is the best Lexicon in the language, and has consequently been translated into Persian and Turkish. Jordshani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidani made a large collection of Arabic 'saws,' apophthegms, &c., which was published by Freytag, Bonn, 1838. Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwithstanding the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th c.; after them, the Germans, French, and English. It is now, however, beginning to be considered a necessary part of a learned theological education. The modern Arabic of the inhabitants is substantially the same as that of the Koran, but the lapse of time has gradually introduced changes in the grammatical forms of the language, similar to those which have occurred in other languages. The purest Arabic is said to be spoken in Yemen, or *Arabia Felix*. With the exception of the Roman characters, the Arabic have been more widely diffused than those of any other tongue on the face of the earth. (See Möller's *Oriental Palæography*, Eisleben, 1844, &c.)

Arabic Writing.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Koran was busily carried on. Its characters are rude and coarse, and it has particular symbols for only sixteen of the twenty-eight Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th c. it was displaced for common purposes by a current handwriting, the *Neskhî*, introduced by Ebn Mokla. This is the character still in use. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line.

ARABIAN NIGHTS' ENTERTAINMENTS, a collection of Oriental tales, first made known to Europe by Antony Galland, a French Orientalist, under the title of *The Thousand and One Nights, Arabian Stories, Translated into French*. They were published at Paris, in 12 volumes 12mo, from 1704 till 1717, and were received by many as the production of the genius of the translator himself, rather than the collection of an unknown Arabian author, as Galland had stated in his dedication. Oriental scholars did not hesitate at first to declare against their authenticity, and denounce them as forgeries. Having taken only an obscure place in the literature of the East, and their style unfitting them from being classed among models of eloquence or taste—having no object of a religious, moral, or philosophical kind in view, while the manners and customs delineated in them were different from all received ideas of those of the Moslem nations—their success took the critics by surprise. The work became highly esteemed by the public; it filled Europe with its fame; it had abundance of readers, and no lack of

editors. Few books have been translated into so many different languages, and given delight to so large a number of readers. It may be said that, in these Oriental tales, there has sprung up a new branch of literature, for their influence on the literature of the present day is easily discernible. Here are found, depicted with much simplicity and great effect, the scenes of the town-life of the Moslem. The prowess of the Arab knight, his passion for adventure, his dexterity, his love, and his revenge, the craft of his wives, the hypocrisy of his priests, and the corruptibility of his judges, are all dramatically delineated—far more vividly represented, in fact, than is possible in a book of travels; while gilded palaces, charming women, lovely gardens, and exquisite repasts captivate the senses of the reader, and transport him to the land of wonder and enjoyment. Besides entertaining the mind with the kaleidoscopic wonders of a teeming and luxurious fancy which is their most obvious merit, they present a treasure of instruction upon life in general, and Oriental life in particular. And this is undeniable, notwithstanding the fact, that the aspects of society they depict are far from standing high in the social scale, either as to civilisation or morality. In them no story is to be found that will rank in morality with the story of Joseph and his brethren, simply because the Moslem faith will not admit of that, any more than the decline of Arab civilisation at the time the tales must have been originally promulgated. Indeed, the first translator, having a conviction of a demoralising tendency of this kind, avoided giving several objectionable parts of some of the stories. The thread of the narrative in these entertainments is generally simple and clear, often leading into the departments of fable, and occasionally into the regions of the supernatural and the domains of popular superstition. The tales, even when long, are not tiresome; for they consist of shorter stories branching off from the main one, or rather encased within it, the smaller within the larger, and perhaps a smaller within that, like the little boxes used by conjurers.

For many years all doubt as to the authenticity of the *Thousand and One Nights* has been dispelled. Several MS. copies have been found, and no less than four editions of the Arabic text have been published. A more thorough acquaintance with mediæval and modern Arab life has proven the genuineness of the stories, and the truthfulness of their general representation of the mind of the Moslem. In them there are evident signs of a declension from a refined and superior civilisation; the marvellous and supernatural is predominant; despotism in all its forms is manifest; and a prevalent falsity and insincerity of character visible, not only in the narrative, but in the tone of common conversation, replete as it is with oaths and asseverations.

The origin of the work—where and by whom written—is still involved in mystery. According to some, the tales are susceptible of a threefold division. The most beautiful, and in fancy the richest, appear to have come from India, the cradle of story and fable; the tender and often sentimental love tales seem of Persian origin; while the masterly pictures of life, and the witty anecdotes, claim to be the product of Arabia. Throughout, however, everything is conformable to the character and customs of the town population of Arabia, and to the Mohammedan faith. The Baron de Sacy, in 1829, thus stated his opinion on these points. Speaking of the work he says: 'It appears to me that it was originally written in Syria, and in the vulgar dialect; that it was never completed by its author; that, subsequently, imitators endeavoured to perfect the work, either by the insertion of novels already known, but

which formed no part of the original collection, or by composing some themselves, with more or less talent, whence arise the great variations observable among the different MSS. of the collection; that the inserted tales were added at different periods, and perhaps in different countries, but chiefly in Egypt; and, lastly, that the only thing which can be affirmed, with much appearance of probability, in regard to the time when the work was composed, is—that it is not very old, as its language proves, but still that, when it was brought out, the use of tobacco and coffee was unknown, since no mention of either is made in the work.'

Galland's French edition was speedily translated into all the languages of Europe; edition following edition with great rapidity, some of them with enlargements, and others with modifications. Later, a Dr. Scott gave a superior English edition, 'carefully revised, and occasionally corrected from the Arabic.' At length a new English translation from the Arabic, with copious notes and highly artistic embellishments, appeared in 1839. It was the work of Edward William Lane, a gentleman whose long residence in Egypt enabled him to acquire so thorough a knowledge of the language, manners, and customs of the Egyptian Arabs, as has furnished not only a superior version, but a series of notes embodying a portraiture of Egypto-Arabian life at once faithful and vivid.

The popularity of this wonderful book has given rise to hundreds of imitations. Among the best of the French are—*Les Mille et Un Jours*, *Mille et Une Quart d'Heures*, and the *Contes d'un Endormeur*; perhaps the best of the English imitations is the *Tales of the Genii*, by Sir Charles Morell; while the best of the German appears to be one got up from the Perso-Arabic, the *Faraj bád el Shidda* (Joy after Sorrow), a popular work, and repeatedly published.

ARABIAN NUMERALS or CIPHERS—the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Properly, they should be styled Hindu or Indian Numerals, for the Arabs borrowed them, along with the decimal system of notation, from the Hindus. According to one account, Gerbert (afterwards Sylvester II.) learned the use of them from the Moors in Spain in the 10th c.; others think it more probable that Leonardo of Pisa (see ALGEBRA) first introduced them from the East into Italy about 1202. Yet the use of them was long in making its way, and was not general before the invention of printing. Accounts continued to be kept in Roman numerals up to the 16th c. See NUMERALS and NUMERATION.

ARABIAN SEA, anciently *Mare Erythræum*, or the *Red Sea*, that bay of the Indian Ocean which lies between India on the east and Arabia on the west. Its northern boundary is Beloochistan; while its natural and convenient limit on the south is a line drawn from Cape Comorin in Hindustan to Cape Guardafui in Africa, and thence continued along the coast to the Strait of Bab-el-Mandeb. In E. long. it extends from 43° 32' at Cape Bab-el-Mandeb, to 77° 30' at Cape Comorin; and in N. lat. from 8° 5' at Cape Comorin, to about 26° at the south-west point of Beloochistan. Including its two great arms, the Arabian and Persian Gulfs, it stretches much further both north and west, connecting itself, more or less closely, with the Mediterranean by means of the Nile and the Euphrates.

In this last aspect the A. S. long occupied a most prominent place in the commerce of the world—a place which, after having lost it for more than 300 years through the doubling of the Cape of Good Hope in 1497, it has lately, in a great measure, regained, through the enterprise of French capitalists, and the liberality of the Egyptian government.

In the history of navigation, also, the A. S. proper is specially entitled to notice. It was along its northern shores that Nearchus, the admiral of Alexander of Macedon, conducted the first well-authenticated voyage, on a large scale, of exploration and discovery; and across it the trade-winds, blowing alternately from north-east and south-west, were wont to waft the Greeks of Egypt, without either chart or compass, about the commencement of the Christian era.

ARABINE is the essential principle of gum-arabic (q. v.), and is obtained pure by adding alcohol to a solution of gum-arabic in water, when the A. is precipitated in white flocculi.

ARACAN, or ARRACAN, a city of Farther India, and, till lately, the capital of the province of the same name. It is situated about 50 miles from the sea, in lat. $20^{\circ} 42'$ N., and long. $93^{\circ} 24'$ E. Lying in a swampy valley which, on almost every side, is confined by hills, A. is subject to febrile disease in all its forms. Previous to the first Burmese war—the occasion which brought it under British dominion—it is said to have contained 18,000 houses; while in 1835, after an interval of less than ten years, its population is represented as having been only 8000 or 10,000—the decrease being, in a considerable degree, the consequence of its having ceased to be the seat of government. A. is now, in fact, interesting only from its old associations. The most striking memorial of antiquity is its dilapidated fort, consisting of three concentric walls such as only a powerful state could have constructed. Beyond the limits, too, of this citadel, the town, as a whole, appears to have been surrounded by a circumvallation of 9 miles in length, composed partly of steep and rugged eminences and partly of artificial works. These defences, which are believed to be several centuries old, the British carried by assault on 1st April 1825.

ARACAN, or ARRACAN, a province of Farther India, bounded on the N. by Chittagong, on the E. by Ava, on the S. by Pegu, and on the W. by the Bay of Bengal. It extends in N. lat. from 18° to $21^{\circ} 33'$, and in E. long. from $92^{\circ} 10'$ to $94^{\circ} 50'$. Its extreme length is 290 miles; and its breadth, from 90 miles at the N., gradually diminishes towards the S., so as to yield an average of little more than 45. The area is estimated at 13,484 square miles. The province is divided into three districts—Akyab or Arracan Proper, Sandoway, and Ramree. The British conquest of the province seems to have been highly beneficial in every way. In 1825—6, the population was only about 100,000; in 1831, it was 173,000, shewing an increase of 73 per cent. in 5 or 6 years; in 1839, it had increased to 248,000; and lastly, before 1854, it was upwards of 321,000. With these results the face of the country and the state of trade fully correspond. A sterile and unprofitable tract has been transformed into a highly cultivated country; trade has increased to an extent that could not have been contemplated; and the variety and quality of the productions have been found to equal those of almost any other region in the same part of the world. Rice and salt constitute the chief articles of exportation; the others are tobacco, sugar, wood, oil, betel-nuts, buffalo hides and horns, elephants' teeth, dried fish, and edible birds-nests. The imports consist of British woollens, muslins, cutlery, and glass.

There have been various indications of a volcanic nature in A. In the islands of Ramree and Cheduba there exist springs of muddy water which emit bubbles of gas. Two severe earthquakes have taken place respectively in 1763 and 1833—the latter having thrown up, in several places, muddy water of a sulphurous smell, and also, on one particular spot,

vapour and flame to the height of several hundred feet. Of the mineral resources very little is known. Iron-ore has been found, but not in such quantity and quality as to come into profitable competition with British iron. Coal also exists, which is understood to be good, but, from whatever cause, it has not been extensively worked. There are no lakes in the province, nor are there any rivers of much importance, though the Aeng, which appears to be the most available among them, is said to be navigable during spring-tides to 45 miles from its mouth.

ARACARI, or ARICARI (*Pteroglossus*), a genus of birds closely allied to the Toucans (see Toucan), and differing from them chiefly in the somewhat smaller bill, which is not so thick as the head. They are generally also of smaller size, and the prevailing colour of their plumage is green, often varied with brilliant red and yellow. Like the toucans, they are natives of the warm parts of South America.

ARACEÆ. SEE ARUM.

ARACHIS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, natives of the warm parts of America, of which, until recently, the only known species was the *A. hypogæa*, sometimes called the underground kidney-bean, and more frequently the ground-nut. It also receives the names of earth-nut, American earth-nut, and mandubi. It is an annual plant, with hairy pinnate

Arachis hypogæa.

leaves, which have four leaflets. The flowers are yellow, the standard veined with red. After flowering, the flower-stalks elongate and bend towards the earth, into which the pods penetrate, ripening underground. The pods have a lining of a sort of net-work, and generally contain two, three, or four seeds, which are about the size of a hazel-nut, of a sweet taste, with a little of the flavour which belongs to most kinds of pulse. This plant is now cultivated in all the warm regions of the globe, and its usefulness is such that its cultivation is likely to extend. It was introduced from Peru into Spain, and thence into France. It succeeds in favourable situations even in the middle of France, where it is sown after all danger of frost is thought to be over, and yields from eighty to one hundred fold. Its cultivation is

so general in the western parts of Africa, and even in the interior, that doubts have been therefore entertained of its American origin, of which, however, the most eminent botanists seem to be quite satisfied. The seeds are sometimes eaten raw, but more generally boiled or roasted. In New Spain, and in some parts of Africa, they form one of the principal articles of food; but the importance of the plant is chiefly owing to the fixed oil contained in them, which is used for the same purposes as olive or almond oil, and is quite equal to olive oil either for lamps or for the table. This oil is also much used in Spain in the manufacture of soap and of chocolate. A bushel of the seeds yields one gallon of oil, when expressed cold; if heat is applied, the quantity is greater, but the quality inferior. It has become a considerable article of commerce. The *A. hypogæa* delights in a light and sandy, but at the same time fertile, soil. The seeds are dug up as roots or tubers usually are. The root has qualities resembling those of liquorice, for which it is sometimes used. The herbage is good food for cattle. Several new species of this genus have been discovered in Brazil.

ARA'CHNIDA, or ARACHNIDES (from the Gr. *arachne*, a spider), a class of articulated animals, commonly regarded as intermediate between insects and crustacea. They were included by Linnaeus amongst insects, and placed in the order *Aptera*. Like the crustacea, they have the head and thorax united into one piece, but they differ from them and

Mygalopsis fodiens.

from insects in having simple eyes, and in the absence of proper antennae, instead of which many of them are provided with a sort of antennal claws called *chelicerae*. These and other organs connected with a complex mouth, disappear, however, in some of the lower kinds, which have merely a sort of proboscis for suction. Some of them breathe

by means of pulmonary cavities; others by tracheae, like insects; and upon this difference is founded the primary division of the class into two orders—*Pulmonaria* and *Trachearia*. Spiders and scorpions belong to the first of these orders, and mites, ticks, &c. (*Acari*) to the second. Some of the *A.* inhabit water, but their mode of respiration is that of terrestrial animals; and they seem to carry air with them by means of the hair which covers their bodies. The sexes are distinct. They are oviparous. They have two or more eyes, very frequently eight; and the relative position of these affords marks for distinction of genera. They have generally eight legs, but some have only six. With the exception of the *acari*, they are solitary in their mode of life, and most of them prey upon insects, of which, however, in general, they only suck the blood. Some of the lower kinds are parasitic upon insects, and a few live on decaying animal and vegetable substances. (See *Acarus*, *Mite*, *Scorpion*, *Spider*, and *Tick*.)

ARA'CHNOID MEMBRANE, one of the three coverings of the brain and spinal cord, is a thin, glistening, serous membrane, which, by its parietal layer, adheres inseparably to the dura-mater on its outer side, and more loosely to the pia-mater which is between it and the brain substance. Between the pia-mater and the *A. M.* in some situations there

are considerable intervals (sub-arachnoid spaces), they are filled with a fluid named cerebro-spinal, the presence of which is necessary to the proper action of the nervous centres. See CEREbro-SPINAL-FLUID—PIA-MATER.

ARAD, a town in the district of *A.* in Upper Hungary. It is situated on the right bank of the Marosh, an affluent of the Theiss, and is also styled Old *A.*, to distinguish it from New *A.*, which is built on the opposite side of the river. *A.* has a population of 19,564, including many Jews, who are very wealthy. It carries on a large trade in corn, tobacco, &c., and was at one time the greatest cattle-market in Hungary, and is even yet only inferior to Pesth and Debreczin. During the 17th c., it was often captured, and at last destroyed by the Turks. Its new fortifications, erected in 1763, made *A.* an important position in the revolutionary war of 1849, when it was occupied for a considerable time by the Austrian general Berger, who capitulated here in July 1849. From this place Kossuth issued his proclamation of August 11, 1849, in which he expressed in impassioned terms his despair of the Hungarian cause for the present. After the catastrophe of Világos, on the 17th August, *A.* was surrendered to the Russians through the treachery of Görgey.

NEW *A.*, a town in the Banat of Temesvar, contains some 4600 inhabitants, including many Germans, who are the principal persons in the place. The district or province of *A.* has an area of 1700 square miles, and contains about 260,000 inhabitants. The eastern district is occupied by a branch-chain of the Carpathian mountains, which contain marble quarries, and mines of copper and iron; the west is level, and produces wheat, maize, and several varieties of wine, as well as abundance of fruits. The inhabitants are chiefly Wallachians.

AR.EO'METER. See AREOMETER.

ARAFAT, MOUNT, or *Jebel-er-'rahme* ('Mountain of Mercy'), is a granite hill about 15 miles S.E. of Mecca, which is believed by the Mohammedans to be the spot where Adam, conducted by the angel Gabriel, met again his wife Eve, after a punitive separation of 200 years, on account of their disobedience in Paradise. It is not above 200 feet high, but its circuit is a mile and a half. Its importance since the time of Mohammed arises from its being the scene of a yearly procession of the faithful who visit Mecca. Burckhardt, who witnessed the procession of 1814, states that not less than 70,000 people were present, and that at least forty different languages were spoken. The principal part of the religious ceremony of this pilgrimage is a sermon, the hearing of which entitles all to the name and privileges of a *Hadj*i.

A'RAGO, DOMINIQUE, a celebrated French astronomer and natural philosopher, was born February 26, 1786, at Estagel near Perpignan, in the department of the Eastern Pyrenees. At the early age of seventeen, he entered the Polytechnic School at Paris, where the spirit, promptitude, and vivid intelligence he exhibited in his answers to the questions of Legendre, excited the admiration of every one. In 1804, he became secretary to the Observatory at Paris. Two years afterwards, he was engaged, with Biot and others, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. *A.* and Biot had to extend it from Barcelona to the Balearic Isles. The two savans established themselves on the summit of Mount Galatza, one of the highest of the Catalonian branch of the Eastern Pyrenees. Here they lived for many months, communicating by signals with

their Spanish collaborateurs, across the Mediterranean in the little isle of Ivica, though many a night the furious tempests destroyed their hut along with the labours of weeks. Visitors they had none, except two Carthusian monks, who were wont to come up and spend a portion of the evening in converse with them. Before A. had completed his calculations, Biot had returned to France, and war had broken out betwixt the two nations. A. was now held to be a spy; his signals were interrupted; and with great difficulty he succeeded in making his escape to Majorca, where he voluntarily imprisoned himself in the citadel of Belver, near Palma. At last he obtained his liberty on condition of proceeding to Algiers, which he did; but was captured, on his return to France, by a Spanish cruiser, and sent to the hulks at Palamos. He was, however, liberated after a time, and sailed once more for France; but almost as he was entering the port of Marseilles, a tempest arose which drove the vessel across the Mediterranean all the way to Algiers. The former day, to whose demands he had owed his liberation from the hulks, was dead; his successor, a ferocious tyrant, placed him on his list of slaves, and intended to employ him as interpreter. After some time, he was released at the request of the French consul, and, narrowly escaping another capture by an English frigate, finally found his way to Marseilles in July 1809. As a reward for his suffering in the cause of science, the Academy of Sciences suspended its standing rules in his favour; and though only twenty-three years of age, he was elected member in the place of Lalande, who had just died, and was appointed Professor of Analytical Mathematics in the Polytechnic School. Afterwards, his attention was devoted more to astronomy, magnetism, galvanism, and the polarisation of light. In 1811, he read a paper to the Academy, which may be considered the foundation of 'chromatic polarisation.' In 1812, he commenced his extraordinary course of lectures on astronomy, &c., which fascinated all Paris—the savans, by their scientific rigour and solidity; the many, by their brilliancy of style. In 1816, along with Gay Lussac, A. established the *Annales de Chimie et de Physique*, and confirmed the truth of the undulatory theory of light. In the same year he visited England for the first time, and made the acquaintance of various persons distinguished in science, especially Dr. Thomas Young. In 1818 appeared his *Recueil d'Observations géodésiques, astronomiques, et physiques*. In 1820, he turned his facile and inventive genius into a new channel, and made several important discoveries in electro-magnetism. Oersted had shewn that a magnetic needle was deflected by a voltaic current passing along a wire. A. pursued the investigation, and found that not only a magnetic needle, but even non-magnetic substances, such as rods of iron or steel, became subject to deflection also, exhibiting, during the action of the voltaic current, a positive magnetic power, which, however, ceased with the cessation of the current. Some time after, he demonstrated that a bar of copper, and other non-magnetic metals, when moved circularly, exert a noticeable influence on the magnetic needle. For this discovery of the development of magnetism by rotation, he obtained, in 1825, the Copley Medal of the Royal Society of London; and in 1834, when he again visited Great Britain, especial honours were paid to him by the friends of science in Edinburgh and Glasgow. Four years previous to this second visit to Great Britain, he had received the honour he most coveted—that of being made Perpetual Secretary of the Academy. It was while holding this office that he wrote his famous *éloges* of deceased members, the beauty of which has given him so high a place among French

prose-writers. As a politician, also, his career was remarkable. He was a keen republican, and took a prominent part in the July revolution (1830). In the following year he was elected by Perpignan as member of the Chamber of Deputies, where he occupied a position on the extreme left. In the February revolution of 1848, he was chosen a member of the provisional government, and appointed minister of war and marine. In this position he resisted the proposed measures of the Socialist party, regarding the constitution of the United States as the beau-ideal of democracy. His popularity in his own province was the means of preventing the discontented population of the East Pyrenees from proceeding to lawless and violent measures. On the question of the presidency, A. opposed Louis Napoleon, declared himself against the policy of the new ministry, and refused to take the oath of allegiance after the *coup d'état* of 1852. The emperor, in a letter, paid a high eulogium on his talents and virtues, and made a special exception in his case. A. died October 3, 1853. In his general character A. was sociable, energetic, and fond of fame. He was the intimate friend of Alexander von Humboldt.

ARAGO, JACQUES ÉTIENNE VICTOR, brother of the great savant, was born in 1790. In 1817 he accompanied the expedition, under Freycinet, in a voyage round the world. Afterwards, we find him engaged, first at Bourdeaux, and then at Toulouse, in several branches of light literature, industriously writing, in company with other scribes, a multitude of vaudevilles, besides publishing several poems and romances. In the year 1835, he undertook the management of the theatre at Rouen; but having become afflicted with blindness, he was compelled to resign this post in 1837. To his early voyage round the world, we owe two very pleasant books of travel: *Promenade autour du Monde* (Paris, 1838); *Souvenir d'un aveugle, Voyage autour du Monde* (Paris, 1838). In 1849, though deprived of sight, he formed a company of speculators; placed himself at the head of it, and departed for California, to search for gold on a large scale. His companions mutinied, and left him, deserted and disappointed, at Valparaiso. On his return, he published his painful experiences, under the title, *Voyage d'un aveugle en Californie et dans les Régions aurifères* (Paris, 1851). He died, January 1, 1855.—A., ÉTIENNE, another brother of the astronomer, was born 1803, and is well known in France as a popular *feuilletonist* in the *Siècle*, and other journals. He held an appointment under the provisional government, as director-general of the post-office, in which he displayed great vigour, promptitude, and sense, and achieved several postal reforms; was elected member of the National Assembly; was compromised by the insurrection in June, and sentenced to exile for life. He went to Belgium, from which the French government secured his expulsion; then to England, Holland, Geneva; and finally to Turin, where he has devoted himself to literary labours.—A. JEAN, another of the brothers A., born 1789, died 1836, was general of the republican army in Mexico, and wrote, in Spanish, a history of Mexico.

A'ARAGON, a province in the north-east of Spain, situated between 40° 2' and 42° 54' N. lat., and long. 2° 10' W., and 0° 45' E. Greatest length from north to south, 190 miles; breadth, 130. Area, 14,710 square miles. Pop. (1864) 921,305. It is bounded, N. by the Pyrenees, separating it from France; W., by Navarre, and Old and New Castile; S., by Valencia, and part of New Castile; and E., by Catalonia, and part of Valencia. The river Ebro, which descends from the northern heights of Old Castile, flows through the middle of A.

in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees, and from the Sierras in the south; of the former, the principal are—the Noguera, which forms the boundary-line between Aragon and Catalonia, the Esera, and the Gallega; of the latter, the principal are—the Guadaloque, the San Martin, and the Salon. The province is naturally divided into the level country, along the Ebro, and the northern mountainous district of Upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines (*barancos*). Agriculture is here confined to the raising of maize, vines, and olives; but on the sides of the Ebro, where water abounds, rice and other grains are abundantly produced; and in the valleys of Upper A., which are at once the most beautiful and fertile of all the Pyrenean valleys, we find a splendid vegetation, and a soil that enables the inhabitants, in spite of the wretchedness of their agriculture, to grow considerable quantities of wheat, rye, maize, barley, &c. The climate of the province is various; comparatively cool in the mountain-districts, but often very sultry on the plains. Spurs of the Pyrenees strike down into the province a long way. It is between these ridges that the rich valleys lie, some of them upwards of 20 miles long. The slopes of the hills are clothed with forests of oak, beech, and pine, and the felled timber is floated down the rivers into the Ebro, and thence down to Tortosa at its mouth. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The manufactures are inconsiderable. A., peopled by a brave, active, enduring, but obstinate race, has frequently been the arena of sanguinary warfare. It early became a Roman province; and, on the fall of the Empire, passed into the hands of the West-Goths, but was conquered by the Moors in the beginning of the 8th c. The rulers of A., after it had been recovered from the Moors, and united with Catalonia (1137), became powerful; obtained possession of the Balearic Isles in 1213, of Sicily in 1282, of Sardinia in 1526, and of Naples in 1410. By the marriage of Ferdinand with Isabella, heiress of Castile, in 1469, the two states of A. and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. In the war with the French, 1808—9, Saragossa, the capital of A., was remarkable for its heroic defence under Palafox; and in the latest Spanish wars, the people of A. have displayed the same courage which marked their conduct on that memorable occasion. Upper A. was on the side of the queen; but lower A. generally adhered to the party of Don Carlos. The province is now divided into three departments—Saragossa, Teruel, and Huesca. The chief towns are Saragossa, Calatayud, Huesca, and Teruel. See SARAGOSSA, &c.

ARAGUAY', a large river of Brazil, rising in S. lat. 18° 10' and W. long. 51° 30'. Like most of the considerable rivers of the country, it flows towards the N. After a course of about 1000 miles to San Joao, it there joins the Tocantins, which again, after a northerly course of 300 miles more, mingles its estuary with that of the Amazon round the Isle of Marajo. Like most of the rivers in this part of Brazil, the A. is of difficult navigation, being frequently interrupted by rapids.

ARAL, LAKE, next to the Caspian Sea, from which it is separated by the plateau of Ust-Urt, is the largest lake in the steppes of Asia. It lies in Independent Tartary, between 43° 42' and 46° 44' N. lat., and 58° 18' and 61° 46' E. long. Length from N. to S., 265 miles; breadth, 125. It is fed by the river Sir (the ancient Jaxartes) on the N. E.

side, and the Amu (or ancient Oxus) on the S. E. It is worthy of remark that Lieutenant Wood, in 1838, found the source of the Oxus in Lake Serikol at an elevation of 15,600 feet, as described by Marco Polo in the 13th c. Lake A. prolongs itself at the south-west in a vast marshy swamp of 80 or 100 miles, called Lake Landau. It is on the same level as the Caspian, and at a remote period was probably connected with it. Humboldt supposes it to have been simply an enlargement of the Oxus, when the latter was a tributary of the Caspian. It is shallow, has no outlet, and is supposed to be decreasing in size on account of the excessive evaporation. Like other lakes which are drained only by evaporation, it is brackish. The middle of the west coast is the only spot where the scenery is at all impressive. The rocks there, which form the eastern edge of the plateau of Ust-Urt, open boldly and abruptly on the water in precipices 500 feet high. A numerous group of small islands occupies the southern end. It contains sturgeon and other fish, which supply food to the nomadic hordes on the coasts.

ARALIA, a genus of plants, the type of the natural order *Araliaceæ*. This order is dicotyledonous or exogenous, and consists of trees, shrubs, and herbaceous plants, resembling the *Umbellifera* (q. v.) both in their general habit and in their botanical characters, but differing essentially in the fruit, which is not *didymous* or formed of two separable carpels as in the *Umbellifera*. The fruit of the *Araliaceæ* consists of several one-seeded cells, and is often succulent. The order contains about 160 known species, natives of tropical, temperate, and cold climates, generally possessing stimulant and aromatic properties. Poisonous qualities are not developed as in the *Umbellifera*. The herbage of many species affords good food for cattle, and some are used for human food. The genus *ARALIA* contains a considerable number of species—trees, shrubs, and herbaceous plants. It has a succulent fruit, with 5 or 10 cells, crowned with the styles. *A. nudicaulis* is a native of the United States of America, a species of humble growth, having a solitary radical leaf with a trifid stalk and ovate serrated segments, the scape is shorter than the leaf. The root is said to be equal in value to sarsaparilla as an alterative and tonic. *A. racemosa*, *A. spinosa*, and *A. hispida*, also natives of North America, produce an aromatic gum resin. *A. spinosa* is a stimulant diaphoretic. The berries, infused in wine or spirits, are employed in America as a cure for rheumatism. It is sometimes called Toothache-tree: it also bears the name of Angelica-tree. It is a native of moist woods in Virginia and Carolina, growing to a height of 10 or 12 feet, with a single stem, spreading head, doubly and trebly pinnate leaves, and ovate leaflets, and is very ornamental in a lawn. *A. polaris*, found in the southern island of New Zealand, and in the greatest abundance and luxuriance in Lord Auckland's Islands, is described by Dr. Hooker as a "very magnificent plant," a herbaceous perennial, 4—5 feet high, with large orbicular masses of green foliage and waxy flowers, presenting a very striking appearance. *A. edulis*, now called *Dimorphanthus edulis*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavour, are used by the Japanese as carrots or parsnips are in Europe. *Aralias* abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice paper has been ascertained to be cut from cylinders of the pith of an *A. Ginseng* (q. v.), the

root of a species of *Panax*, is one of the most important products of the order *Araliaceæ*. The astringent roots of *Gunnera scabra*, or Panke, are used in tanning, but its fleshy leaf-stalks are eaten like those of rhubarb. It has been seen on the sand-stone cliffs of Chiloe with leaves nearly eight feet in diameter, each plant with four or five of these enormous leaves. It has been introduced into Britain, and is found to succeed well in the climate of Edinburgh. The only representatives of this order in the British flora are the Ivy (q. v.), and a small plant called the Tuberous Moschatel (*Adoxa moschatellina*).

ARAM, EU'GENE, was born in 1704 at Ramsgill, in Yorkshire. His father was a gardener, and could afford to keep A. at school only for a short time; but even while assisting his father, he contrived to gratify his passion for learning. At an early period of his life he married, and became a schoolmaster, first in Netherdale, and afterwards at Knaresborough, where he continued to reside till 1745. In the town of Knaresborough lived one Daniel Clarke, a shoemaker, and an intimate acquaintance of A.'s. On one occasion Clarke happened to purchase a quantity of valuable goods, which he easily obtained on credit; but to the surprise of everybody, he soon after disappeared, and no trace of him could be discovered. Suspicion lighted upon A., not as Clarke's murderer, but as his confederate in swindling the public. His garden was searched, and in it was found a portion of the goods which Clarke had purchased. A. was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough, and went to London, and other parts of England, in his capacity of schoolmaster, and in spite of his nomadic mode of life, contrived to acquire a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish, and was planning a great etymological work, to be entitled, 'A Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic languages,' when he was suddenly dragged away from his ushership of Lynn Academy, in Norfolk, and committed to prison on a charge of murder.

The circumstances of the remaining portion of the story are pretty well known. In 1759, a skeleton was dug up near Knaresborough, which the inhabitants suspected to be that of Clarke, for they had now come to the conclusion that the unfortunate man had met with foul-play, especially as A.'s wife had, on several occasions, made strange statements to the effect that her husband and a man named Houseman, knew more of Clarke's disappearance than they chose to admit. Houseman was now confronted with a bone of a skeleton which had been discovered. He very emphatically denied that it was Clarke's. People naturally wondered how he *could* be so positive, the bones of skeletons being, to the uneducated eye, so similar in appearance. They became convinced that if the skeleton was not Clarke's, Houseman must know where the latter was. At last he confessed that he had been a spectator of the murder of Clarke by A. and one Terry. He named the place where the body had been hidden. It was searched, the buried skeleton was dug up, and A. was tried at York, for the murder of Clarke, on the 3d August 1759. What has given so extraordinary an *éclat* to this trial, is the fact that A. conducted his own defence. He attacked with great acumen, plausibility, and curious erudition, the doctrine of circumstantial evidence; but to no effect, for a verdict of guilty was returned, and he was condemned to be executed three days afterwards. In the interval, he confessed his guilt to the clergyman who attended him. While in the condemned cell, he wrote a defence of suicide; but failed in a practical illustration of the doctrine, which he forthwith attempted.

ARAME'A (from the Hebrew word *Aram*, signifying the highland in opposition to the lowland of Canaan) includes the whole of the country situated to the north-east of Palestine. Its boundaries, though not rigorously defined, were as follows: N., by Mount Taurus; E., by the Tigris; S., by Arabia; and W., by Arabia, Phœnicia, and Lebanon. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. The *Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the west Aramaic or Syriac, and the east Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. Ever since the Babylonian captivity, the pure Hebrew, in which the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, had gradually given place to the Aramaic. The Aramaic version of the Bible was that used in Christ's time, who quotes from it, and not from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeats on the Cross. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements. The Aramaic dialect is, in general, the harshest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out, and given place to the Arabic and Persian. Indeed, it is only found living among some tribes in remote districts of the mountains of Kurdistan, and in two or three villages in Syria; yet it is considered highly probable that it is the root of the whole cluster of Semitic tongues.

ARA'NDA, PEDRO PABLO ABARCA DE BOLEA, COUNT OF, born in 1718 of a distinguished Aragonese family, at first embraced a military career; but having evinced a remarkable spirit of observation, he was appointed by Charles III. ambassador to the court of Augustus III. king of Poland; which post he filled for seven years. After his return, he was appointed captain-general of Valencia, and in 1766 recalled to Madrid on account of its disturbed state, and the presidency of the Council of Castile was bestowed on him. A. not only soon restored order in the capital, but limited the power of the Inquisition, procured the expulsion of the Jesuits from Spain, and carried the salutary terror of government into the recesses of the Sierra Morena, then infested by hordes of ferocious banditti. Like many other reformers, he was not able fully to carry out his liberal intentions. In 1773, he was removed from his high position through the influence of the clergy, the Dominican monks especially, and sent as ambassador to France. Grimaldi succeeded him in his office, and after him Count Florida Blanca; but when the latter lost his office in consequence of court intrigues, A. returned to his position; soon, however, to lose it again through the agency of Godoy, Duke of Alcudia, the queen's favourite. He, however, still remained President of the Council of State, which he had organized; but upon his expressing his views regarding the war with France, he was banished to his native province of Aragon, where he died in 1799.

ARA'NEA and ARANE'IDÆ. See SPIDER.

ARANJUEZ (a corruption of the Latin *Ara-Jovis*, altar of Jupiter), a town in the province of Toledo, Spain. It is situated on the left bank of the Tagus, 28 miles south south-east from Madrid, in a beautifully wooded valley, and is now connected with the Spanish metropolis by a railway. The town is built in the Dutch style, has broad and regular streets intersecting each other at right angles, and a

population of 3600. It is famed for its palace and gardens. The former was long a favourite resort in spring of the royal family, during which period A. occasionally reckoned as many as 20,000 inhabitants; the latter were laid out by Philip II., who built a palace also, for there was only a shooting villa here during his father's time, but a fire destroyed a portion of it, and more was taken down by Philip V., who reconstructed the edifice in French style. The present château was completed by Charles IV. On account of its gardens, the natives call A. 'the metropolis of Flora.' These gardens are interspersed with numerous summer-houses, the most celebrated of which is the *Casa del Labrador*, or Labourer's Cottage; but their most splendid ornament are the great elm-trees brought from England by Philip II., which thrive magnificently. They radiate out from a central plot in twelve distinct rows. A. is known historically for the treaty of alliance concluded here between France and Spain on the 12th of April 1772, and as the scene of the abdication of Charles IV. on the 18th of March 1808.

ARANY, JANOS, next to Petöfi the most distinguished of modern Hungarian poets, was born at Nagy-Szalonta, in 1819. His father was a poor peasant, who spared no pains to get him into the church. In 1832, he entered the college at Debreczin, where he distinguished himself by his diligence; but unable to restrain his love of adventure, he joined, in 1836, a company of strolling-players, with whom he travelled about for several months, till driven by necessity and an upbraiding conscience, he hurried home to do what he could for the support of a now blind and aged parent. For some time he was engaged as a Latin tutor; but in 1840 he was appointed notary at Szalonta. He now married, and devoted his whole time to his profession. When the Kisfaludy Society of Pesth offered a prize for the best humorous poem, A. sent in, anonymously, his *Az elveszett Alkotmány* (The Lost Constitution of the Past.) He was successful. Thus emboldened, he ventured, in 1847, to forward to the same society the first part of a Trilogy, *Toldi*. Struck by the beauty of this purely national effort, the members published it at their own expense, and again rewarded the author. A. soon became a popular favourite. His reputation penetrated even into the lowest ranks of the community. In 1848 appeared his *Murány Ostroma* (Conquest of Murány), which, however, received less attention owing to the political excitement of the time. The poet himself took a slight part in the revolution, but after the dismal termination of the war, he was allowed to return to his country. Since then he has published a narrative poem, *Katalin* ('Catherine'), Pesth, 1850. Besides which numerous stray pieces have appeared in the magazines. Some of his works have been translated into German.

ARAPATMA, a genus of fresh water fishes, the largest known fresh water fishes in the world. They are found in the rivers of South America, and are sometimes taken in the Rio Negro 15 feet in length, and of the weight of 4 cwt. They are taken with the harpoon, and are highly esteemed for food, both fresh and salted. In the salted state, they have begun to form an article of commerce, and are conveyed in large quantities to Para. The genus A. belongs to the family of *Clupeosoides*, a family of malacopterous fishes, allied to the *Clupeidae* or herring family, and is remarkable for the mosaic work of strong, bony, compound scales with which the body is covered. About six species are known.

A'RARAT (Aírarat, in the old Armenian dialect; i. e., the plains of the Aryans), the ancient name of

the fertile plateau through which flows the river Aras or Araxes. It occupies the centre of the mountainous region of Armenia, belonging partly to Turkey and partly to Russia. Notwithstanding the passage in Genesis viii. 4, where it is said that the ark rested 'on the mountains of Ararat,' it has become common to give the name A., not to the entire range, but to the mountain called by the Armenians Massis Leusar—i. e., 'mountain of the ark' (known among the Turks as Aghri-Dagh, 'steep mountain;' and among the Persians as Koh-i-Nuh, 'Noah's mountain'), a solitary volcanic cone covered with perpetual snow and rising to the height of 17,212 feet above the level of the sea. This, the highest elevation of Western Asia, towers up from the eastern edge of the Armenian table-land, and forms

Mount Ararat.

the point where the Russian, Turkish, and Persian territories meet. It stands in 39° 42' N. lat., and in 44° 35' E. long. The table-land of this part of Armenia has an elevation of 7000 feet, and out of this rises an isolated and sublime mass of rock 10,000 feet high, whose gleaming pinnacles of ice are said to be visible to mariners on the distant Caspian. The summit from certain positions represents the appearance of a ship. The first ascent of the mountain was achieved by the naturalist Parrot and his companions in 1829. They did not, however, quite reach the top. In 1850, it was ascended by Colonel Khælzko, and a large party of Russians engaged in the transcaucasian triangulation.

ARAS, the ancient *Araxes*, a river of Armenia, formed by the junction of the Bingol-Su and the Kaleh-Su, and uniting its waters with those of the Kur (ancient *Cyrus*) after a course of about 500 miles. The main stream is the Bingol-Su, which rises in the Bingol-Tagh, in lat. 41° 30' N., and long. 41° 10' E.; and flowing N. N. E., is joined a little below Hasan-kaleh by the Kaleh-Su, after which the combined stream is called the A. It then flows eastward, forming for some time the southern boundary of the province of Kars, till it is joined by the Arpa, which flows into it from the north. After this, it divides Russian and Turkish Armenia; at some distance to the south of Erivan it turns to the south-east, along the base of Ararat; soon after which it receives the waters of the Zenghi, a river descending southward past Erivan. Near Djulfa it runs eastward for about 60 miles; after which it runs to the north-east for upwards of 125 miles, till it is joined by the large river Kur, descending from the Caucasus through Georgia. Their united waters, after a short eastward course, turn suddenly to the south, and fall by three mouths into the Gulf of Kizilgatch, in the Caspian, in lat. 39° 20' N.

ARATUS, OF SICYON, a distinguished Greek statesman, was born about 271 B.C. His youth fell among the party strifes of his native town, in which his father Clinias, met his death; and he himself was only saved by the efforts of his aunt, who had him secretly conveyed to Argos, whence he returned, in his twentieth year, and liberated Sicyon from its tyrant, Nicocles, 251 B.C. Supported by Ptolemæus Philadelphus, A. restored the republican form of government to Sicyon, and united it with the Achaian League, of which he was appointed general, 245 B.C. During his honorable but checkered career, this office was conferred on him seventeen times. His great object was to unite the Greek states, and form out of them an independent nation; but this was thwarted by their mutual jealousies. A. was a brave general, a skilful tactician, and a disinterested patriot. He died by poison administered to him by command of Philip III. of Macedon.

ARATUS, OF SOLI (or Pompeiopolis, in Cilicia), wrote about 270 B.C., a Greek didactic poem, entitled *Phænomena*, founded on the astronomical system of Eudoxas of Cnidos, and appended to it another poem, *Diosemeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, which were translated into Latin by Cicero, Caesar Germanicus, and Rufus Festus Avenius. A. was a native of the same province as St. Paul, who quotes from him in his speech on Mars' Hill: 'For as certain of your own poets have said, We also are his offspring.' The best edition is that by Buhle, 2 vols. Leipsic, 1793—1801.

ARAUCARIA, that portion of Chili which lies between the Biobio on the N. and the Valdivia on the S. But, though thus embosomed as it were within Chili, it forms an aboriginal state, which is virtually independent of that republic. A. extends in S. lat. from $36^{\circ} 44'$ to $39^{\circ} 50'$, and in W. long. from 70° to $74^{\circ} 30'$ —its length being about 180 miles, and its general breadth from the shore of the Pacific to the crest of the Andes being 150. This country, comprising perhaps about 25,000 square miles, is divided from north to south into four parallel regions, varying from each other, with tolerable regularity, in soil and climate. These are the coast region, the plain region, the region of the Lower Andes, and the region of the Higher Andes. The productions of A. are similar to those of Chili. The population cannot be accurately estimated on account of the independence of the nation; but from their successful resistance to the Spaniards, it must be presumed to be comparatively dense.

A. has the proud distinction of being the only portion of the New World that has never received the European yoke. From the days of Pizarro and Almagro downwards, it has uniformly vindicated its freedom—its wars of independence having lasted, with intervals of precarious truce, from 1537 to 1773. As early as 1568, the Araucanians, taking a lesson from their enemy, brought into the field some squadrons of cavalry; and in the war between Chili and Spain, some Araucanian youths of the first rank served as officers in the republican armies.

ARAUCARIA, a genus of plants of the natural order *Coniferae* (q. v.) or Pines, consisting of lofty trees, natives of the southern hemisphere, and distinguished by having the male and female flowers on separate plants, the pollen of the male flowers contained in 10—20 cases pendent from the apex of each scale, the female flowers two under each scale; each having one ovule. The species are all evergreen, the leaves broader than in pines and firs, which, however, the trees resemble in their general manner of growth. *A. imbricata*, sometimes called

the CHILI PINE, a native of the Andes of Chili, forming forests on their western declivities, attains a height of 150 feet, the trunk quite straight and free

Araucaria imbricata:

End of a branch, much reduced, shewing the mode of ramification, and the manner in which the leaves are imbricated.

from knots. The bark of the young tree is studded with leaves from the base upwards, even until 12 or 15 years of age. The branches are in whorls of 6, 7, or 8. Young trees have branches almost from the ground; old trees have tall naked stems, with a crown of branches. The female strobile (cone) is roundish ovate, 8—10 inches in diameter, the scales terminated by a long awl-shaped point, the seeds wedge-shaped, and more than an inch in length. The

Araucaria imbricata:

Sketched in the Botanic Gardens, Edinburgh.

outer and inner bark of full-grown trees are each 4—6 inches in thickness; the outer bark of a cork-like texture; the inner, fungous and porous. From both outer and inner bark, and indeed from all parts of the tree, resin flows readily and in great abundance. The leaves are lanceolate, about $1\frac{1}{2}$ inch in length, and $\frac{1}{4}$ inch in breadth near the base, sharp-

pointed. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a smell like frankincense, and a not unpleasant taste. It is applied as a plaster to contusions. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. It is eaten raw, boiled, or roasted. A spirituous liquor is also distilled from it. A single strobile sometimes contains between 200 and 300 seeds, and one tree may be seen loaded with 20 or 30 of these great strobiles. This *Araucaria* was introduced into Britain in the end of last century, and is now pretty frequently planted. It promises to add a new feature to British landscapes, as other trees of the same order, particularly the larch and spruce, have done before, and will probably prove important in an economical point of view. It is the only species which seems suited to the climate of Britain. *A. Brasiliana*, the BRAZIL PINE, has loosely imbricated lanceolate leaves, and a looser and more spreading habit than *A. imbricata*. The seeds or nuts are sold as an article of food in Rio Janeiro. The resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, now called *Eutassa excelsa* (and by some *Atlingia*), the NORFOLK ISLAND PINE, a native of Norfolk Island, New Caledonia, &c., attains a height of 160—220 feet, free from branches to 80—100 feet, and with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. The leaves of the young trees are linear and spreading; those of the adult are ovate, and closely imbricated. The strobiles are ovate, 4—5 inches in length. *A. Cunninghamii*, now also ranked in the new genus *Eutassa* or *Atlingia*, the MORETON BAY PINE, a native of the shores of Moreton Bay and banks of the Brisbane River in New South Wales, very much resembles the last. It attains a height of 60—130 feet, and a diameter of 4—8 feet. The leaves of the adult trees are lanceolate and imbricated. The wood is yellowish, and is used for boat-building, house-carpentry, and the common kinds of furniture. The large seeds of *A. Bidwillii* are used for food by the natives at Moreton Bay.

Certain fossil *Conifera* found in carboniferous sandstone have received the name *Araucarites*. Livingstone found a forest of large silicified trees near the Zambesi, which Mr. Quekett, on examination of specimens, ascertained to be 'silicified coniferous wood of the Araucarian type.' Fossil trees of the same type occur in the carboniferous strata of Britain. A trunk, for instance, 47 feet long, was found in Craighleith Quarry, near Edinburgh, in 1830.

ARAUJO, D'AZEVEDO ANTONIO, afterwards Count da Barca, was born at Sá, in the neighbourhood of Ponte de Lima, in Portugal, on the 14th of May 1754. At the age of 11, he was sent to Oporto to study under his uncle, who held a high military command there. In 1787 he was appointed Portuguese ambassador to the Hague. Before entering on his duties, he visited England, where he omitted no opportunity of obtaining a knowledge of English manufactures, commerce, politics, &c. He next proceeded to Paris, where he similarly employed himself. Soon after his arrival at the Hague, he found himself entangled in political difficulties. The French Revolution had broken out, but the part which he played in the complication of political affairs which ensued falls to be treated more properly under the History of Portugal (q. v.).

At length he threw up his ambassadorship, and travelled through Germany, enlarging the sphere of his studies. He paid especial attention to mineralogy and chemistry, and was fortunate enough to

become acquainted with Goethe, Wieland, Schiller, Herder, &c. After the Peace of Amiens, A. was sent as ambassador to St. Petersburg; in 1803 he was recalled to Lisbon, to assume the office of Secretary of State; and in 1806 he obtained the highest political dignity in the kingdom. His efforts to introduce the various agencies of civilisation, while he occupied this situation, were unremitting. Glass, paper, wool, and cotton manufactures, received liberal encouragement. But the sudden approach of the French army put an end to all his improvements. The royal family, which Bonaparte had formally dethroned in his victorious proclamation, emigrated to Brazil. A. embarked also, taking along with him a complete printing apparatus, his mineralogical collection, arranged by Werner, and all necessary chemical instruments. During the first years of his residence in the New World, he devoted himself assiduously to scientific and literary pursuits; founded a school of medicine and chemistry, introduced the cultivation of tea, an improved machine for sawing wood, and a sugar-alembic, and established a porcelain manufactory. He had also a magnificent garden, the plants of which were scientifically arranged. He died on the 21st June 1817.

ARAU'RE, a town of Venezuela, South America. It is situated in lat. 9° 17' N., long. 69° 28' W., 60 miles E.N.E. of Trujillo, in a region noted for its fertility in the production of cotton, coffee, cattle, &c. The town itself is rather handsome, and contains 10,000 inhabitants.

ARBALEST, ARCU'BALEST, or CROSS-BOW, was a weapon much in use during the feudal times. Its recognised position among military arms may be dated from about the period of Richard I. The smaller kinds of A. were bent by pressing the

Arbalest.

hand on a small steel lever called the 'goat's foot;' but the larger kinds were bent by placing the foot in a loop or stirrup at the end of the central shaft, and drawing the cord upwards with the hand. At a later period, the bow was made very strong, often of steel; in this form it required a mechanical contrivance, called a 'moulinet,' to bend it. Sometimes ordinary arrows were used with the A., but more usually arrows of a shorter and stouter kind, called 'carrials' or 'quarrels,' were employed; these had a four-sided pyramidal form of head. Occasionally stones and leaden balls were shot from the larger Arbalests. The arbalestiers, or cross-bowmen, carried a quiver with fifty arrows as an armament in some of the battles of the 13th c. They were an essential component of armies of that period, taking up their position in the van of the battle-array; some were mounted, some on foot, and they occasionally wore armour. The supply of arrows or quarrels was carried after them to the battle-field in carts. The A. continued to be a favourite weapon in England throughout the 13th c.; but in the 14th, it gave way to the long-bow, which was found to be a more convenient weapon in battle. The long-bow is described under BOW AND ARROW; and the general military system to which it belonged, under ARCHERS AND ARCHERY.

ARBALESTINA, in the military system of the

middle ages, was a small window or wicket through which the cross-bowmen shot their quarrels or arrows at an enemy besieging a fortified place.

ARBĒLA, now Erbil or Arbil, a small town of Assyria, east from Mossul, famous as having given name to the battle in which Alexander finally defeated Darius, 331 B. C. The battle was really fought near Guagamela (the 'camel's house'), to the north-west of A.

ARBITRATION is the adjudication by private persons appointed to decide a matter, or matters in controversy, on a reference made to them for that purpose, either by agreement of the disputants or by the order, or on the suggestion, of a court of law. The proceeding generally is called a *submission to arbitration*, or *reference*; the parties appointed to decide are termed *arbitrators*, or *referees*; and their adjudication is called an *award*. This mode of settling disputes is not only frequently resorted to by litigants themselves, who are anxious to avoid the delay and expense of proceedings in the public tribunals, but the Statute-Book bears witness to the approval of it by the legislature at various times. An old act, the 9 and 10 Will. III. c. 15, testifies the benefits of A. in strong terms, declaring that 'it hath been found by experience that references made by rule of court have contributed much to the ease of the subject in the determining of controversies, because the parties become thereby obliged to submit to the award of the arbitrators,' and it proceeds to authorise and encourage merchants, traders, and others to put an end to their controversies and quarrels by means of A.; and a modern act, passed in 1833, the 3 and 4 Will. IV. c. 42, ss. 39, 40, and 41, contains still more anxious provisions for rendering references to A. effectual. Since that act was passed, the practice and feeling in favour of A. has increased, so much so that there are recent statutes which contain provisions rendering A., or private reference in certain cases, compulsory. The Railway Acts of 1845, the Public Health Act of 1848, and the Common Law Procedure Act of 1854, are modern examples of this legislative peculiarity.

The matters that may be determined by an arbitrator are all personal disputes and differences which might otherwise be made the subject of controversy in the courts of civil jurisdiction. Thus breaches of contracts generally, breaches of promises of marriage, trespass, assaults, charges of slander, differences respecting partnership transactions or the purchase price of property, and questions relating to tolls or the right to tithes, may all be referred to A. Questions relating to real property may also be referred, such as those relating to the partition of lands of joint tenants or tenants in common, to settlements of disputed boundaries—to differences between landlord and tenant respecting waste—and to the title to land. Pure questions of law may also be referred to the decision of an arbitrator. An arbitrator may have, therefore, to determine the liability of a party on a promissory-note or bill of exchange, or to construe an act of parliament, or to give a judicial opinion on the effect of a will or deed. Actions at law, and suits in equity, may also be settled by A.; and this kind of reference may be made at any stage of the proceedings, sometimes even after verdict, and probably by analogy, after decree in equity. Questions relating to the future use and enjoyment of property, and future or anticipated differences between parties, may likewise be referred.

A matter, however clearly illegal, cannot be made the subject of a valid reference. But where transactions between parties have been brought to a close by a general award, apparently good, the courts

have refused to re-open them on a suggestion that some illegal item has been admitted in account.

There are certain matters which are specially referred to A. by statute. Besides those we have already alluded to, the following matters are all referable to A.: Questions relating to the expenses of prisoners, under the 5 Geo. IV. c. 85; to the regulation of municipal corporations in England and Wales, under the 5 and 6 Will. IV. c. 76; to the laws concerning prisons, under the 5 and 6 Vict. c. 98; to disputes between masters and workmen, under the 5 Geo. IV. c. 96, amended by the 7 Will. IV. and 1 Vict. c. 67; to the laws relating to savings' banks, under the 9 Geo. IV. c. 92, and 7 and 8 Vict. c. 83; to the land rights and other possessions of certain ecclesiastical and collegiate corporations, under the 2 and 3 Will. IV. c. 80; to the management and improvement of episcopal and capitular estates in England, under the 17 and 18 Vict. c. 116; to the conveyance of mails by railways, under the 1 and 2 Vict. c. 98; to insolvents and to insolvency, bankruptcy, and execution, under the 1 and 2 Vict. c. 110, 7 and 8 Vict. c. 96, 12 and 13 Vict. c. 106; to the constitution of companies incorporated for carrying on public undertakings, under the 8 and 9 Vict. c. 16; to the taking of lands for undertakings of a public nature, under 8 and 9 Vict. c. 18; to the metropolitan sewers, under the 11 and 12 Vict. c. 112 (continued and amended by the 12 and 13 Vict. c. 93, the 14 and 15 Vict. c. 75, the 15 and 16 Vict. c. 64, the 16 and 17 Vict. c. 125, the 17 and 18 Vict. c. 111); to friendly societies, under the 17 and 18 Vict. c. 56, and the 18 and 19 Vict. c. 93.

Under these acts of parliament, the class of cases which may, or which must, be referred to A., have been greatly enlarged. The railway acts, in particular, have largely contributed to this kind of amicable determination, although the parties in such cases cannot be said to have much discretion in the matter. Under the provisions, again, of the Common Law Procedure Act, 1854 (17 and 18 Vict. c. 125, ss. 3 and 6), parties may be compelled by the court, or judge who tries the case, to refer matters of mere account in an action which cannot be conveniently tried in the ordinary way.

Among the questions that cannot be referred to A., are matters arising out of the administration of the criminal law in the case of felonies and relating to agreements or transactions against public policy. Felonies and offenses of a public nature cannot be referred, because the public safety and good require them to be punished, and for this purpose they can only be properly tried in one of the ordinary courts of the country.

With respect to matters which cannot be referred on account of their being against public policy, the rule is so obviously just as not to need illustration.

But there are certain misdemeanours which may be either settled by agreement or by means of an A., on a principle of very general application stated by Chief-justice Gibbs—that where there is a remedy, by action as well as by indictment, a reference of the matter in controversy is good. And in these cases of misdemeanour, a compromise or settlement under a reference may be made, even after conviction, but with the sanction of the court.

As to the parties who may make a reference to A., it may be stated generally, that every one capable of making a disposition of his property or release of his rights may make a submission to an award, and in this category may be placed a married woman, who has a separate estate settled to her separate use, and there are even cases where a reference between a husband and wife has been held valid; and of course a husband may submit to A. differences

respecting his wife's personal estate which has not been settled to her separate use.

Respecting the powers of infants or persons under age to submit to A., there are numerous decisions in the courts of law and equity: but they go upon refinements and nice distinctions more suited for the professional lawyer than for the ordinary reader, and we therefore do not think it necessary to give any explanation of them in a popular article such as this professes to be.

Partners and corporations may make references to A. on the principles already explained, and according to the relation in which they stand to the matter in dispute.

Those who cannot submit to A. are persons in the following position: Persons who cannot contract; married women without any estate settled to their separate use; and along with them, as laid down in old ante-reformation books, persons professed in religion, and persons under duress. There is an exception to the incapacity of married women to refer to A. where the husband, by exile, banishment, or other cause, is held to be civilly dead, and when he is an alien enemy. To these exceptions it may be added, that in suits respecting the property of charities the Court of Chancery will not permit a reference, however advisable such a course may seem, unless the attorney-general gives his consent.

It has generally been the opinion of the legal profession, and held to be the doctrine of the courts, that a reference by the consent of counsel in a cause is binding on his client; and Lord Chancellor Eldon once said, that it was for the counsel to consider whether he was authorised to refer, and if so, he (the chancellor) would act on the consent so given; and the right and privilege of counsel to make a reference has been very strongly laid down in the Scotch courts. But a very recent case in the Court of Common Pleas (*Swinfen v. Swinfen*), where a compromise by counsel was successfully resisted by the client, has very much unsettled the English law on this subject; and now the feeling of the Bar in England is, that it is unsafe to refer or compromise a litigation on the independent authority of counsel.

Submissions to reference may also be made by executors and administrators, by trustees, by the committee of a lunatic, and by the officer of a public company, who is authorised by a statute to sue and be sued in the name of the company. And there are persons especially empowered to refer by the statutes which we have already enumerated.

Disputes may be referred to A. in any manner that expresses the agreement or understanding of the parties to be bound by the decision of the arbitrator; and for this purpose no formal submission, either verbal or written, is necessary; but the arrangement must be such as manifestly to shew an intention to have the difference concluded by a private adjudication in the nature of an award. But where the submission is in writing, it must be executed in due form. A testator, however, cannot exclude his will from litigation by a proviso, that all differences respecting it shall be referred to A., although it is thought that the parties benefited by the will might themselves so refer. Generally speaking, it is advantageous to make the A. in such a form as that the award may be made a rule of court—that is, may be adopted by a court of law as its judgment on the matter submitted, a proceeding that affords an obvious facility in enforcing the award; and for this purpose it is necessary to make the procedure conformable to the directions of the statutes 9 and 10 Will. III., and 3 and 4 Will. IV., already referred to. Where the submission is merely verbal or constituted by a private bond or deed, it is liable to be capriciously revoked, and proceedings

on the award, in such a case, can only be taken in the Court of Chancery.

The arbitrator ought to be a person who stands perfectly indifferent between the disputants; but there are no other particular qualifications for the office. And the choice by parties of the person who they agree shall decide between them, is perfectly free. Some legal writers have even gone so far as to maintain, that not only infants and married women, but even idiots and lunatics, can be arbitrators, on the argument that every person is at liberty to choose whom he likes best for his private judge, and he cannot afterwards object to the deficiencies of those whom he has himself selected. But this, it is thought, is going too far, and the policy of the law would probably be interposed against such extreme cases. It is better to state the rule to be, that on the condition that the party selected is of ordinary intelligence, the choice of an arbitrator is absolutely unfettered. The only exception to this rule is the case of a party who, by office or position, is the person pointed out for the duty under a reference made by statute. In matters of complicated accounts, mercantile men are generally preferred. In other cases, it is usual to appoint barristers who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in making the award, to avoid those informalities in respect of which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. It has, indeed, been wisely remarked, that an arbitrator should endeavour to arrive at his conclusions upon the same rules and principles which would have actuated the court for which he is substituted—a rule of conduct that obviously points to the expediency of a lawyer being the referee. But an arbitrator is not bound by the mere rules of practice which prevail in the ordinary courts of justice, and he has been held justified in allowing interest on both sides of an unliquidated account, although such a determination was against the practice of the Court of Chancery, where the suit, which had been referred, had been commenced.

The proceedings before an arbitrator are regulated according to the peculiar circumstances of the case submitted, but generally it is advisable to conduct them according to the forms observed in courts of law, and they usually are so conducted. Each of the parties furnishes the arbitrator with a statement of his case, which is done by giving him a copy of the briefs on each side; and on the day appointed he proceeds to hear them (either in person or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge at an ordinary trial. Having so heard the case, the arbitrator proceeds to make his award, which need not necessarily be in writing, for a verbal award is perfectly valid; but in practice it is usual for the arbitrator to make his award on paper stamped with the proper award stamp, and this he delivers to the successful party. The unsuccessful party gets a copy of the award on unstamped paper. This award in its effect operates as a final and conclusive judgment respecting all the matter submitted, and it binds the rights of the parties for all time.

An award may be set aside on the ground of corruption and fraud in the arbitrator, and for any material irregularity or illegality appearing on the face of the proceedings. But the tendency of the courts is to favour arbitrations and maintain awards, unless such serious grounds as we have referred to can be substantiated.

Where there are two arbitrators, the submission often provides that in the case of their differing in opinion the matter referred shall be decided by a

third person, called an umpire, who is generally appointed under a power to that effect, by the arbitrators themselves. But they cannot make such an appointment unless specially authorised so to do by the terms of the submission. This umpire rehears the case, and for this purpose is invested with the same powers as those possessed by the arbitrators, and bound by the same rules.

In Scotland an A. takes place in virtue of a written submission executed by the parties in favour of the chosen referee, who there is called an arbiter, instead of arbitrator, as in England; and his award is called a decree-arbital. This submission is in the form of a regular deed, and is said to be general or special, according to the nature of the matters submitted by it, the submission specifying all the particulars of the reference, and the name of the referee—the arbiter's powers and duties, which, in the ordinary case, are of the most comprehensive character—the specification of the time within which the award or decree-arbital is to be made—a clause obliging the parties to perform the award under a specified penalty; and other anxious provisions, which are all carefully specified in the submission. The case then proceeds before the arbiter, generally according to the forms observed in the ordinary Scotch courts; and the arbiter makes his award in a very solemn manner, the decree-arbital commencing with a recital of the submission and of all the procedure—and after stating that the arbiter has ripely considered the whole matter, and has 'God and a good conscience before his eyes,' it gives the arbiter's judgment, and among other things ordains the submission and decree to be recorded according to the clause of registration in the former, and the extract from the registry so made forms a judgment which may be put in execution by either party against the other. The decree-arbital, like the submission itself, must be executed and attested in the form of a regular deed. Where there are two arbiters, the submission usually provides, that in the event of their differing in opinion, they shall name an umpire or oversman, as he is called in Scotland, whose judgment is final.

In conclusion, and as a remark, on A. generally, it only remains to be stated, that of course, from the nature of the case, there can be no appeal on the merits of the dispute submitted to any public tribunal whatever.

ARBOGA, an ancient city in Sweden, in the province of Westmanland, on a small river of the same name, by which, with the aid of a canal, the lakes Hialmar and Mälär are united. A. used to be an important commercial town, but it has now sunk into insignificance, and only possesses an historical interest from the antiquities in its neighbourhood. Of all its churches, cloisters, and chapels there only now remain the town and parish churches, the former with an altar-piece of Rembrandt's. Several kings of the family of Vasa have resided here. Church assemblies were held here in 1396, 1412, 1417, 1423, and 1474; diets in 1435, 1440, 1471, 1529, and 1561, in which last year also certain articles, known as the Arboga Articles, were passed by which Eric XIV. was enabled to limit the power of the nobles; and in 1625, Gustavus Adolphus issued an edict here, commanding that the copper coin of the realm should contain its full worth of copper.

ARBORESCENT (from Lat. *arbor*, a tree), a term applied to plants to signify that they possess either altogether, or in some measure, the character of trees. Even the dwarf willows and birches, on the confines of polar or alpine perpetual snow, are described as the A. vegetation of these regions.

ARBORICULTURE (from Lat. *arbor*, a tree), a term literally signifying the cultivation of trees, but in use generally restricted to the planting and management of timber trees, or employed as exclusive at least of the cultivation of fruit trees, which is a branch of horticulture or gardening.

The ancients practised A. to some extent, but chiefly with the view of beautifying their villas, or of forming public walks in the vicinity of cities. It is only for similar purposes, and on a very limited scale, that A. is yet anywhere practised in America. The planting of timber trees for economical purposes, or with a view to profit, is unnecessary whilst natural forests are abundant, and can scarcely be referred even in Britain to an earlier period than the beginning of the 16th c., nor did it become at all general till a much later date. The early forest laws of England, as of other feudal countries, had reference chiefly to game, for the sake of which it was, and in order to the enjoyment of the chase, that large tracts were depopulated and converted into forests by the first Norman kings. Plantations for timber and fuel were, however, certainly made in England in the 16th c.; and the importance of the subject was urged on public attention by authors of that period. In the 17th c., the greatly increased demand for oak, for the building both of ships and of houses, gave a new impulse to A., which attracted more than ever before the attention both of the government and of the great landowners; the publication of Evelyn's *Sylva* also did more than any previous work to promote a taste for it. It was in this century that nurseries for forest trees were first established. It was not until the beginning of the 18th c. that the first extensive plantations were made in Scotland, nor until towards the end of that century that A. became general in that country or in Ireland. How much the very landscape has been changed by it—how great a difference has been made by the conversion of bleak hills and barren wastes into woods—how much the scene has been changed by the new forms of foreign trees, some of which are now in many districts more abundant than those which are indigenous, it is not easy to imagine; and how much these changes have promoted and are indicative of improvements in agriculture and increased productiveness of fields, is equally difficult to estimate.

The A. of France, Germany, and other parts of Europe, to this day, consists in a great measure of the management of natural forests; and in the more eastern parts of the continent this is almost exclusively the case. Without a careful management of the natural forests, many districts of France and Germany would soon be destitute of fuel; by means of it an increased supply of valuable timber is also obtained; and extensive domains belonging to the state, or to private proprietors, are rendered much more productive. It is in Germany that the management of the forests has received the greatest attention, and has been most systematically and scientifically conducted.

The forest trees of Britain, and of temperate climates generally, are conveniently divided into two classes—the one consisting of coniferous trees or pines and firs (*Nadelholz*, i.e., the 'needlewood' of the Germans), the other including all other kinds (*Laubholz*, i.e., the 'leaf-wood' of the Germans); the latter being sometimes subdivided into *hard-wooded trees*, of which the most important in Britain are oak, ash, elm, beech, birch, hornbeam, sycamore, walnut, and chestnut; and *soft-wooded trees*, as willow, poplar, lime, alder, and horse-chestnut. Of these and other trees, of their particular uses, and of the soils and situations to which they are adapted, notice is taken in separate articles.

Plantations are generally formed in Britain by

means of trees raised from seed in a nursery; but sometimes also by sowing the seed on the ground intended for the plantation; in which case, if circumstances permit, a crop of grain is often sown along with the seeds of the tree, as these do not in general vegetate very soon; and the young plants derive advantage from the absence of choking weeds when the grain-crop is reaped, and from the protection afforded by the stubble. It has been supposed by some, but there is no sufficient evidence in support of the opinion, that more healthy and vigorous trees are obtained by sowing on the spot than by planting those which have been raised in a nursery. However, only very young trees can be planted with advantage, those which have attained a greater size requiring a degree of attention far beyond what is possible in plantations even of very moderate extent. The time of planting is from November to February. The most approved mode of planting is in small pits, in which the roots are disposed in a natural manner, and which are then carefully filled up with earth; but it is often thought sufficient when the tree to be planted is very young, to make a slit for it with the spade, or two slits, one at right angles to the other in the form of the letter T. Other methods are also adopted, particularly for rocky situations, in which the spade cannot be used. Economy is often a consideration of great importance in determining the mode of planting.

The formation of plantations by the sowing of seed has been more generally practised on the continent than in Britain. In this way the vacancies in the natural forests of France and Germany are filled up. In this way also great sandy tracts have been covered with wood on the coasts of Pomerania and of France. This has particularly been accomplished on a scale of extraordinary magnitude in the downs of drifting sand, between the rivers Adour and Gironde. The operations there were begun by M. Bremondier in 1789, and deserve to be mentioned as perhaps the most important operations in A. that have ever been performed in the world. Vast forests of pinaster now occupy what was originally loose sand destitute of vegetation.

Too little attention has hitherto been generally paid to the adaptation of the kinds of trees that are planted to the soil and climate; and to this cause many failures in A. are to be ascribed. Some trees grow well even in exposed situations, and are fit to be employed in these, either to form entire plantations, or to occupy the outer part, and so to shelter other trees, which in general are not planted until the outer zone or belt of the most hardy kinds is somewhat advanced; some succeed only in rich soils; some are incapable of enduring the sea-breeze; others, as the sycamore, the elder, and the pinaster, are comparatively unaffected by it. Some trees suffer from an amount of moisture from which alders or willows would rather derive advantage; but, in general, the thorough drainage of the land intended for a plantation is one of the circumstances most important to its success.

To the necessity of this thorough drainage we must look as compensating, or more than compensating, the influence which woods exercise in condensing the moisture of the atmosphere, and in rendering a climate cold and damp; marshy soils being in this respect still worse. The shelter afforded by plantations judiciously disposed, whether in belts or otherwise, is also of great importance in rendering them suitable for that improved agriculture in which thorough drainage is of the first necessity, and which is always productive of amelioration of climate. The influence of plantations is therefore, upon the whole, beneficial, although vast masses of

forest are injurious to climate; and it must be admitted that in some localities the planting of trees has been carried to excess, so that fields often suffer, particularly in autumn, from want of free circulation of air, and the landscape is often restricted to very narrow limits. The remedy in such cases is obvious; and it not unfrequently happens that within a short distance new plantations might be formed with every prospect of benefit.

Much has been written about the pruning of forest trees, with a view especially to the production of taller and straighter stems; and considerable difference of opinion exists as to the extent to which pruning should be practised. It is, however, very generally delayed till the branches to be removed have attained too great a size, and is then very rudely performed, to the spoiling of the timber rather than to the improvement of it. The practice of leaving *snags*, instead of cutting branches clean off, has particularly bad effects. Pines and firs, from their manner of growth, need pruning less than trees of other kinds. When trees have been planted, not merely for profit but for ornament, this ought to be remembered in pruning, which, however, is too often intrusted to persons utterly devoid of taste; and trees which, as they naturally grew, were very beautiful, are so treated with axe and saw that they become deformities instead of adorning the scene.

In forming plantations, different kinds of trees are very generally mixed, although masses of one particular kind are also frequently planted. It is usual, however, to plant along with those which are destined most permanently to occupy the ground, trees of other kinds as *nurses*, to be gradually removed as the plantation advances in growth. For this purpose, spruce and larch are more generally employed than any other tree; although Scotch fir and birch are also deemed suitable for certain situations. The removal of some of these nurses affords the first returns of profit from the plantation, which is afterwards thinned from time to time. Plantations far more frequently suffer from being thinned too little, than from being thinned too much. To the want of proper thinning is to be in part ascribed the failure of many of these narrow belts of *planting* which are too common in Scotland, and which having been intended for shelter, very imperfectly serve their purpose, and seem to have suffered from the hardest usage themselves. The thinning of a plantation which has been allowed to grow too thick, must, however, be very gradually performed, that it may be beneficial, and not injurious. After a sudden thinning, a plantation sometimes ceases to thrive, and many trees are often laid prostrate by the next storm; for trees accommodate themselves both in their roots and branches to the situations in which they grow.

A considerable number of years must elapse before any pecuniary return is derived from a plantation, yet this mode of employing soils is often found to be the most remunerative of which they are capable, even without reference to the improvement of adjacent lands to which shelter is afforded; and the increased demand for timber in Britain, for *sleepers* of railways and other purposes, tends to the still further encouragement of A.

The resinous products of pine-woods are not considered as a source of profit in Britain; but the tar, turpentine, and resin obtained from them in some parts of Europe, form articles of commerce. The great pinaster plantations already mentioned, on the sands between the Adour and Gironde, now yield products of this kind in large quantity. The employment of trees for ornamental purposes belongs not so much to A. as to Landscape Gardening (q. v.) The transplanting (q. v.) of large trees is only practised for

ornamental purposes. Hedgerow trees are planted chiefly for ornament, although sometimes they may afford useful shelter; but where this is not the case, they can seldom be reckoned profitable, as they are injurious to crops. Copse or coppice-wood differs so much, both in its uses and in the mode of its management, from other plantations, that it must be briefly noticed in a separate article.

ARBOR VITÆ (*Thuja*), a genus of plants of the natural order *Coniferae*, allied to the cypress, and consisting of evergreen trees and shrubs with compressed or flattened branchlets—small, scale-like, imbricated leaves—and monœcious flowers, which have 4-celled anthers, and the scales of the strobiles (or cones) with two upright ovules.—The common

Arbor Vitæ (*Thuja occidentalis*).

A. V. (*T. occidentalis*) is a native of North America, especially between lat. 45° and lat. 49°, but has long been well known in Europe. It is a tree of 40—50 feet high; its branches are horizontally expanded, and the strobiles (cones) small and obovate. The young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been recently recommended as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is very common in Britain, but planted chiefly as an ornamental tree, and seldom attaining so great a size as in its native country. It delights in cool, moist situations.—The CHINESE A. V. (*T. orientalis*), a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose and rough strobiles, is also in Britain, and upon the continent of Europe, a common ornament of pleasure-grounds; but it does not attain so great a size as the preceding, and is more sensible of the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin, having a pleasant odour, to which high medicinal virtues were formerly ascribed; hence the remarkable name, *Arbor Vitæ* (Latin, signifying Tree of Life), given to this species, and extended to the genus. Other species are known, but they are less important than these. In its native country, this species also attains the size of a considerable tree.—There are several other species of *Thuja*, some of which seem well suited to the open air in the climate

of Britain, and others require the protection of green-houses. Amongst the former are *T. plicata*, from Nootka Sound; and *T. dolabrata*, a native of Japan, a tree of great height and thickness, and which will not improbably prove the most important of the whole genus.—A tree, common in North America, and there known by the name of WHITE CEDAR, is sometimes included in the genus *Thuja*, under the name of *T. sphaeroides*, but is more generally ranked in the genus *Cupressus* as *C. thyoides*. See CYPRESS. The timber is highly esteemed, and an infusion of the scrapings is sometimes used as a stomachic.—Closely allied to the genus *Thuja* is *Calitris*. See SANDARACH.

ARBROATH, ABERBROTHWICK, or ABERBROTHOCK, a small seaport town in the east of Forfarshire, situated at the mouth of a stream called the Brothock. Here King William the Lion founded a Tyronensian abbey in honour of Thomas-à-Becket in 1178. The king was interred in it in 1214. In the abbey, Bruce and the Scottish nobles met in 1320, to resist the claims of Edward II. to Scotland. Cardinal Beaton was the last of its abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the Reformers in 1560. Its ruins—which are cruciform, 270 by 160 feet—are very picturesque, presenting lofty towers, columns, Gothic windows, and a fine circular east window, ‘the Round O of A.’ The chief manufactures of A. are leather, thread, coarse linens, and canvas. Its harbour is artificial, and defended by a battery, but a bar of rock in front injures its entrance. In 1857 the number of vessels belonging to the port was 104; tonnage, 13,896. The chief exports are grain, potatoes, fish, pork, and pavement, chiefly from Lower Devonian quarries 8 or 10 miles inland. A. is a royal burgh, and in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to parliament. Population, in 1861, of municipal burgh, 8500; of parliamentary, 17,591. A. is supposed to be the Fairport of *The Antiquary*, and its Redhead Crags and Coves form some of the scenes in that novel. The famous Bell-rock Light-house stands in the sea, 12 miles south-east of A.

ARBUTHNOT, JOHN, a distinguished writer and physician, the contemporary and friend of Pope and Swift, was the son of a Scottish episcopal clergyman, and born at Arbuthnot, in Kincardineshire, shortly after the Restoration. He studied medicine at Aberdeen, where he took his degree. A.’s father was obliged to resign his charge at the revolution. His sons’ prospects being thus blighted in their own country, they were under the necessity of going abroad to seek their fortune. John removed soon after to London, and there supported himself by teaching mathematics. In 1697 he published an examination of Dr Woodward’s account of the Deluge, which brought him into notice as a person of no common ability. Accident called him into attendance on Prince George of Denmark, who thenceforth patronized him. In 1709 he was appointed physician to the queen, and in 1710 was elected a member of the Royal College of Physicians. On the death of Queen Anne, in 1714, he lost his situation, and his circumstances were never so prosperous afterwards. In 1717, A., along with Pope, gave assistance to Gay in a farce, entitled *Three Hours after Marriage*, which, however, in spite of having the aid of a trio of wits, proved a complete failure. In 1723 he was chosen second censor of the Royal College of Physicians; in 1727 he was made an Elect, and had the honour to pronounce the Harveian oration for the year. He died

at Hampstead, in 1735. A. was one of the leaders in that circle of wits which adorned the reign of Queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He assisted Swift and Pope in the composition of that brilliant satire, the *Memoirs of Martinus Scriblerus*, contributing those portions of it which refer to science and philosophy; and he was undoubtedly the author of the celebrated political *jeu d'esprit*, the *History of John Bull*, which has so often been imitated. Besides several medical essays, he published *Tables of Greek, Roman, and Jewish Measures, Weights, and Coins* (London, 1705—1708), a work which was long the best authority on the subject. There is also a philosophical poem of his composition in Dodsley's *Miscellanies*, entitled *Know Thyself*.

ARBUTUS, a genus of plants of the natural order, *Ericca*, containing a number of species, small trees and shrubs, the greater part of which are American. The fruit is fleshy, 5-celled, many-seeded, usually dotted with little projections, whence that of some species has a sort of resemblance to strawberries; the corolla is urn-shaped.—*A. U'nedo*, the

Arbutus U'nedo.

STRAWBERRY TREE, is a native of the south of Europe, found also in Asia and America, and in one locality in the British Isles, the Lakes of Killarney, where its fine foliage adds much to the charm of the scenery. It requires protection in winter in the climate of Paris. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20—30 feet, but is rather a great bush than a tree. The bark is rugged; the leaves oblongo-lanceolate, smooth and shining, bluntly serrated; the flowers nodding, large, greenish white; the fruit globose, of a scarlet colour, with a vapid sweetish taste. It is, however, sometimes eaten. Of late, excellent alcohol has been made from it in Italy. A wine is made from it in Corsica, which, however, is narcotic, if taken in considerable quantity, as the fruit itself is, if eaten too freely. The bark and leaves are astringent.—*A. Andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *A. integrifolia*, are eaten in Greece and the east. But all the species seem to possess narcotic qualities in greater or less degree; the fruit of *A. furens*, a small shrub, a native of Chili, so much as to cause delirium.—*A. aculeata*, which abounds at Cape Horn and on Staten Island, is an elegant and most pleasing evergreen, very much resembling the myrtle. It grows to the height of 3 or 4 feet, and produces small white flowers, followed by a profusion of red shining berries, which ornament the bush during winter.

Their flavour is insipid, but somewhat astringent. Mixed with a few raisins, they have been made by voyagers into tolerable tarts.—*A. Uva ursi*, now generally called *Arctostaphylos Uva ursi*, the RED BEARBERRY, is a small trailing evergreen shrub, common in the Highlands of Scotland and in the Hebrides, and indeed in the northern parts of Europe, Siberia, and North America. It grows in dry, heathy, and rocky places. The flowers are in small crowded terminal racemes, of a beautiful rose colour. The berries are austere and mealy; they are said to form a principal part of the food of bears in northern regions. Grouse also feed on them. The dried leaves are used as an astringent and tonic medicine, and as such have a place in the pharmacopœias, being principally employed in chronic affections of the bladder; but those of *Vaccinium Vitis Idæa* are often fraudulently substituted for them.—The BLACK BEARBERRY (*A. or Arctostaphylos alpina*) is also a native of the northern parts of the globe, a small trailing shrub, with black berries about the size of a sloe, relished by some, but having a peculiar taste, which to others is disagreeable. The plant is found on many of the Highland mountains of Scotland.

ARC (Lat. *arcus*, a bow) is any part of a curved line. The straight line joining the ends of an A. is its *chord*, which is always less than the A. itself. Arcs of circles are *similar* when they subtend equal angles at the centres of their respective circles; and if similar arcs belong to equal circles, the arcs themselves are *equal*. The length of an A. is readily found if the angle which it subtends at the centre of the circle is known, and also the length of the whole circumference. Let the whole circumference be 100, and the angle of an A. 50°, the length of the A. is $360^\circ : 50^\circ :: 100 : \frac{100 \times 50}{360} = 14$ nearly.

ARC. See JOAN OF ARC.

ARCA, or ARK-SHELL, a genus of bivalve shells, and lamello-branchiate mollusca, the type of a family called *Arcadae*, or *Arcacea*. In the true ark-shells, the hinge is straight, and occupies what at first seems the whole length of the shell, but is in reality its whole breadth, the breadth being greater than the length. One species is found on the British shores; the species are larger and more numerous in the seas of warmer climates, and some of them are frequently to be seen among the shells employed for the ornament of drawing-rooms, &c. Fossil *Arcadae* are, however, more numerous than recent species, and are found in various rock systems.

ARCADE (Fr.), a row of arches, supported by columns, either having an open space of greater or less width behind them, or in contact with masonry. The A. in Gothic corresponds to the colonnade in classical architecture, the difference between them being that, whereas the pillars in the colonnade support straight architraves, those in the A. support arches. The term A. is sometimes applied to the row of piers, or columns and arches, by which the aisles are divided from the nave of a church, or by which cloisters, or what are erroneously called piazzas in Britain, are enclosed; but it is more generally confined to those series of smaller arches which are employed simply for purposes of ornamentation. Arcades of the latter kind are often found surrounding the square towers of English churches. Of this we have early examples in the church of Middletown Stoney, Oxfordshire, and in the still older ones of Tewkesbury, and Christ Church in Oxford. The term is also applied, improperly, to a glass-covered street or lane, with a row of shops or stalls on each side.

ARCADIA, the middle and highest part of Peloponnesus, was bounded on the N. by Achaia, on

the E. by Argolis, on the S. by Messenia and Laconia, and on the W. by Elis. According to Pausanias, it derived its name from Arcas, the son of Callisto. Next to Laconia, A. was the largest country in the Peloponnesus. It had an area of 1700 square miles, and was girt round by a circle of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions. The western part of what was anciently A., is wild, bleak, and rugged, and was at one time covered with huge forests; the eastern is more fertile, the mountains not so high, and the vales more luxuriant. In these eastern valleys lay all the principal cities of A. The loftiest peak in A.—the loftiest also in the Peloponnesus—is Mount Cylene, in the north-east (778 feet). The chief river was anciently the Alpheius (q. v.). Originally A. was named Pelasgia, after its first inhabitants, the Pelasgi. Subsequently, it was divided into several small states, which formed a confederation. Of these united states, the chief were Mantinea, Tegea, Orchomenos, Pheneus, Psophis, and Megalopolis. The inhabitants, engaged chiefly in tending cattle and in hunting among the wild highlands, remained long in a state of barbarism. After civilisation had advanced, and the Arcadians had become known by their love of music and dancing, they still retained some military spirit, and were sometimes engaged as mercenary soldiers. But generally their character accorded with their simple, rural mode of life; though it seems certain that human sacrifices were offered as late as the period of the Macedonian sway. The Arcadians were not remarkable for their intelligence. In fact, an 'Arcadian youth' was a synonym for a blockhead. Pan and Diana were their favourite deities. Ancient and modern poets (the latter especially in the time when 'pastorals' were popular) have described A. as the land of peace, innocence, and patriarchal manners.

ARCA'DIUS, first emperor of the East (395—408 A. D.), was born in Spain, 383 A. D., and was the son of the Emperor Theodosius, after whose death the Roman empire was divided into East and West. A. lived in oriental state and splendour, and his dominion extended from the Adriatic Sea to the river Tigris, and from Scythia to Ethiopia; but the real rulers over this vast empire were, first, the Gaul Rufinus, and afterwards the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while A. reposed in luxurious indifference. In 399, the eunuch Eutropius was deposed by another usurper, Gainas, who, in his turn, soon fell a victim to his own ambition. Afterwards, Eudoxia, the wife of the emperor, assumed the supremacy. One really great man adorned this period, the virtuous and eloquent Chrysostom, who was persecuted by Eudoxia, and through her influence exiled in 404, on account of his firm opposition to Arianism, which the empress herself favoured. During the reign of A., his territories suffered by barbarian incursions, earthquakes, and famine, but nothing could disturb the indifference of the monarch. He died, unlamented, 408 A. D.

ARCESILA'US, a Greek philosopher, founder of the New Academy, was born at Pitane in Eolia, Asia Minor, 316 B. C. He studied philosophy, first under Theophrastus the Peripatetic, and afterwards under Crantor. After the death of Crantor, A. became the chief master of the Academic party, or those who held to the doctrines of Plato; but he introduced so many changes that his philosophic character was completely changed. His great rivals were the

Stoics, whose opinions he attacked, but he does not appear to have attained any certainty in his own convictions. He had studied under too many masters, and discussed too many different systems, to be sure of the truth of any. He denied the Stoical doctrine of a 'convincing conception,' which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, and recommended abstinence from all dogmatic judgments. In practice he maintained that we must act on grounds of probability. It is not easy to determine satisfactorily what his moral character was. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he has yet been accused by his enemies of the grossest profligacy; and whatever extravagance there may be in such an extreme charge, it is tolerably certain that he died of a debauch in his 76th year (241 B. C.). Nevertheless, his adversary Cleanthes, the Stoic, passed this high eulogium on him: 'The morality which A. abolishes in his words, he re-establishes in his actions.'

ARCH, an arrangement of bricks, stones, or other materials over an open space, by which they are made not only to support each other by mutual pressure, but to sustain a superincumbent weight. We have the excellent authority of Sir G. Wilkinson for stating that the A. was known to, and used by, the ancient Egyptians; and that the Assyrians were acquainted with its principles is placed beyond doubt by the arched gateways so frequently represented in their bass-reliefs. The A. is generally supposed to have been unknown to the Greeks—a supposition which becomes very improbable if we hold it to be proved that it was used by nations with whose works they must have been familiar. But that the Greeks did not employ it generally in their architectural structures, is certain; and as it is not less certain that the Romans did, it is to the latter people that the nations of modern Europe are indebted for their acquaintance with its great utility. The introduction of the A. by the Romans gradually effected a complete revolution in the architectural forms which they borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, as the Romanesque passed into the Gothic style, it was superseded by the segments of a circle, placed generally more or less in a perpendicular direction. In its earliest application by the Romans, the A. did not spring from the entablature of the columns, but was generally placed behind them, and rested upon separate imposts. Subsequently, this arrangement was departed from, and the A. assumed the position which it has since retained above the columns; sometimes having an entablature interposed, and sometimes rising directly from the capital of the column or pier, as in the Romanesque. Before mentioning very briefly the different forms of the A., it seems natural to refer to a very simple structure, frequently met with in those early edifices in our own country which we are in the habit of designating as Saxon. It consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. The mechanical principles upon which the A. depends, though here very imperfectly employed, seem sufficiently called into play to suggest their more extensive application; and it is not impossible that out of this rude construction the A., in its later and more elaborate forms, might have developed itself amongst ourselves without hints from foreign sources.

Of the A. itself, the following variations of form

may be enumerated: The semicircle (1), the segment (2), the ellipse (3), which were the only forms employed by the ancients, and which alone were known in medieval architecture up to the time at

being met with in Arabian and Romanesque buildings. At a later period of Gothic architecture, with

1. Semicircle.

2. Segment.

3. Ellipse.

4. Stilted A.

5. Horseshoe A.

which the pointed A. was introduced. Of these, the stilted A. (4), and the horseshoe A. (5), are modifications, in both of which the centre or point from which the A. is described is above the line of the impost, but in the former of which the mouldings are continued downwards vertically; whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe A. belongs peculiarly to Arabian architecture (q. v.), not only from its having originated simultaneously with the faith of the Prophet, but from its continuing to be used exclusively by his followers. Next, in point of time, though far surpassing all the others in beauty and variety, is the pointed A., the origin of which is still a subject of antiquarian controversy. The greater or less acuteness of the pointed A. depends on the position of the two centre points from which its curved sides are described. Its various proportions will be better understood from the accompanying diagrams (6, 7, 8, 9) than from any verbal description.

6. Equilateral A.

7. Lancet A.

8. Drop A.

9. Segmental A.

Of the foil arches (10, 11, 12, 13, 14), or arches in which the forms of a leaf are imitated, the first

14. Polyfoil A.

the decorated style, the ogee A. (15) was introduced, and the Tudor or four-cornered A. (16) appeared about the commencement of the perpendicular style.

15. Ogee A.

16. Tudor A.

When first introduced, the proportions of this A. were bold and effective; but it was gradually depressed till the principle of the A. was lost, and its very form was again merged first in two and then in one flat stone or lintel over an opening. With the last form of the Tudor A. we thus reach almost the point of departure in the construction of the A., and complete our enumeration of its forms.

The sides of an A. are termed *haunches* or *flanks*, and its highest part is called the *crown*. The wedge-shaped stones, bricks, or other materials of which an A. is constructed, are called *voussoirs* (a, a, a); the uppermost one of all (b) is called the *keystone*; the lowest, which is placed immediately over the impost, the *springer*, or *springing-stone*; the under or lower side of the *voussoirs*, the *intrados*; the upper side, the *extrados* or *back*. For the investigation of the mechanical principle of the arch, and of the conditions of stability, see Moseley's *Mechanical Principles of Engineering and Architecture*. See also BRIDGE, IMPOST, PIER, BUTTRESS.

ARCH, TRIUMPHAL, was a structure erected by the Romans across roads, or at the entrance of

three are examples of the trefoil, the fourth of the cinquefoil, and the fifth of the polyfoil, the latter

Triumphal Arch of Constantine at Rome.

cities, in honour of victorious generals. The original

triumphal arch was the Porta Triumphalis, one of the gates of Rome through which the triumphal procession entered the city. Among the earliest detached arches built at Rome was that built by Scipio Africanus (190 B. C.) on the Capitoline Hill. Under the emperors, these structures became numerous and magnificent, and were decorated with bass-reliefs and inscriptions. Three of what were properly triumphal arches still remain in Rome, those, namely, of Titus, Septimius Severus, and Constantine. Numerous similar monuments exist also in other parts of the old Roman empire, as at Rimini, Susa, Verona, Ancona, Orange (in France), Capura (in Spain).

ARCHÆOLOGY (Gr. *archaios*, ancient, and *logos*, a discourse) is the name now very generally given to the study which was formerly known as that of 'antiquities.' The term is well enough understood, although its meaning is not at all definitely fixed. In its widest sense, it includes the knowledge of the origin, language, religion, laws, institutions, literature, science, arts, manners, customs—everything, in a word, that can be learned of the ancient life and being of a people. When so used, it comprehends more or less of several branches of knowledge which are recognised as distinct or independent pursuits, such, for example, as ethnology, philology, history, chronology, biography, mythology, numismatics. In its narrower but perhaps more popular signification, A. is understood to mean the discovery, preservation, collection, arrangement, authentication, publication, description, interpretation, or elucidation of the materials from which a knowledge of the ancient condition of a country is to be attained. These materials will be found to divide themselves into three great classes: (1.) written, (2.) monumental, and (3.) traditional. 1. What may be called written A., may be again subdivided into palæography (q. v.), or diplomatics (q. v.)—that is, the science of ancient writings; and bibliography (q. v.), or the knowledge of printed books. 2. Monumental A. admits of almost endless subdivisions, according to the character of the remains to be studied, which may be works of art, such as buildings, sculptures, paintings, engravings, inscriptions, coins, medals, seals, armorial-bearings, tapestry, furniture, plate, jewels, enamels, glass, porcelain, pottery; works of engineering, such as roads, canals, mines, piers, camps, forts, walls; works of unskilled labour, such as pillars of unhewn stone, caves, dikes, ditches, mounds of earth or stone; articles of dress, armour, or personal ornament; tools, weapons, implements, utensils, machines; appliances for locomotion, such as canoes, boats, ships, carriages; modes of sculpture, such as mummies, sarcophagi, urns, catacombs, graves; vestiges of man and animals, such as skulls, bones, skins. 3. Traditional A. includes as well the unwritten language and oral literature of a people, their dialects, legends, tales, proverbs, rhymes, songs, and ballads, as those sports, customs, ceremonies, rites, and superstitions now beginning to be known by the name 'folklore,' and formerly called 'popular antiquities.'

The study of A. in modern Europe may be held to date from the revival of letters. It was long almost exclusively confined to the antiquities of the Greeks and Romans. About the middle of the 16th c., Medieval A., or the antiquities of the Dark and Middle Ages, began to be cultivated. Egyptian A., or 'Egyptology,' as it is sometimes called, made comparatively little progress until the discovery of the Rosetta Stone, containing a bilingual and trilingual inscription, which enabled Young in 1819, and Champollion in 1821, to find a key to the hieroglyphics. The more recent discoveries of Botta, Layard, Rawlinson, and others, have already advanced Assyrian A. to a point beyond all expecta-

tion. Indian A. has been successfully prosecuted, especially during the last forty years, chiefly by officers of the East India Company. Something also has been done by them and others for Chinese A. Men of letters in the United States have devoted their time to the rude and scanty remains of the aboriginal inhabitants of North America. The A. of Central and South America, as it attracted attention much earlier, so its more stately and instructive monuments have much better rewarded such investigations as those of Lord Kingsborough, Messrs Stephens and Catterwood, and others.

The study of A. has been largely promoted by the publication, at the expense of the State, in various countries, of the national chronicles, charters, and records; by societies and clubs contributing to the same end, or printing essays on questions of A.; and by the establishment by the state, by associations, or by individuals, of museums for the collection and classification of antiquities. In England, a society for promoting the study of antiquity was founded so early as the year 1572. The irrational jealousy of the government dissolved it in 1604. It was revived 1707, enlarged in 1717, and incorporated by royal charter in 1751, under the name of the 'Society of Antiquaries of London.' An attempt to institute a similar society in Scotland was made about 1700 by 'some honourable and knowing gentlemen,' who resolved to continue their conferences till a complete historical account be made of the nation. But it was not until 1780 that the Society of Antiquaries of Scotland was incorporated by royal charter. The Royal Irish Academy for promoting 'the study of science, polite literature, and antiquities,' was chartered in 1786. The Society of antiquaries of Scotland and the Royal Irish Academy, have good museums of national antiquities. The British Museum in London (established in 1753), besides a great collection of early manuscripts and printed books, has galleries of Assyrian, Egyptian, Etruscan, Greek, Roman, British, and Medieval antiquities. One of the most remarkable collections of antiquities on the continent, is that of the Royal Society of Antiquaries of the North, at Copenhagen, arranged so as to illustrate a favourite theory of the Scandinavian archæologists—that the primitive antiquities of a country may be assigned to three successive ages or periods of stone, bronze, and iron, with as much certainty and precision as the comparative antiquity of geological strata, or periods of the world's creation may be determined by the fossils which they are found to contain. The museums of the Louvre and the Hôtel de Cluny, in Paris, contain fine collections of Assyrian, Egyptian, Greek and Roman antiquities, and an unrivalled collection of Medieval antiquities. The Royal Museum at Naples has gathered together the statues, paintings, vases, household utensils, and other objects recovered during the last hundred years from the ruins of Herculaneum and Pompeii. These long buried cities may be regarded as being in themselves museums of Roman A.

ARCHANGEL, the chief city in the Russian department of Archangel, is situated in lat. 64° 32' N. and long. 40° 33' E., about 40 miles above the junction of the river Dwina with the White Sea; is the seat of an archbishop, and contains 19,584 inhabitants. Its name is taken from the monastery of St. Michael. A. is the chief commercial city for the north of Russia and Siberia, and is visited by numerous vessels—especially British—from July to September, the port being clear of ice only during that period. The houses are built chiefly of wood; and their general appearance is far from handsome. The finest edifices are the bazaar or mart, and the

marine hospital. A. has an ecclesiastical college with 9 professors, schools for engineering and navigation, &c. The chief articles of traffic are fish, train-oil, skins, furs, timber, wax, iron, tallow, bristles, caviare. The town, which is the oldest seaport of the empire, and was for a long period the only one, was founded in 1584. Its merchants trade as far east as China, and have all the commerce of Siberia. During summer, A. has a continual market.

ARCHANGEL (from the Greek prefix *archi-* or *arch-*, denoting chief, and *angelos*, an angel), a term which occurs in the New Testament; and which, according to some, is there a title of our Saviour—but, according to others, designates an angel superior in power and glory to the other angels. We read, in the Epistle of Jude, of 'Michael the A.', and in Rev. xii. 7, of 'Michael and his angels.' In 1 Thess. iv. 16, we are told that the coming of our Lord at the last day shall be 'with the voice of the A., and with the trump of God.' We nowhere read in the Holy Scriptures of *arch-angels*, although the plural is popularly as much used as the singular. The notion of an angelic hierarchy certainly prevailed among the Jews, the highest place being assigned to Michael; and the same notion has extensively prevailed in the Christian church. There are passages of Scripture which seem to indicate different degrees and classes among the angelic hosts, but no clear revelation has been made upon this subject. See **ANGELS**.

ARCHANGEL, New. See **SIRKA**.

ARCHBISHOP (Gr. *arch-*, and *episcopos*, overseer) is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in the chief town of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original over the newly-appointed chief pastors. In the Oriental Church, the archbishops are still called 'metropolitans,' from the circumstance first mentioned. In the African Church, on the other hand, the term used was 'primus.' The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th c., the A. of Rome has assumed the name of Pope (papa). There is an official letter by Justinian, addressed to 'John, A. of Rome and Patriarch,' and several ecclesiastical constitutions are addressed to 'Epiphanius, A. of Constantinople and Patriarch.' The synod of Antioch, in 341, assigned to the A. the superintendence over all the bishoprics, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the patriarchs (q. v.) towards the end of the 4th and during the 5th centuries, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation

of indulgences, and the like. The archbishops further enjoyed the honour of having the cross carried before them in their own archiepiscopate, even in presence of the pope himself, and of wearing the *pallium*. In England, there are two archbishops, of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though as ruling over a province in place of a single diocese, both have enjoyed the rank of metropolitans from the first, the A. of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior A., but as possessing a pre-eminent and universal authority over the whole kingdom. This pre-eminence is marked in the titles which they respectively assume—the A. of Canterbury being styled the Primate of all England (*metropolitanus et primus totius Anglie*), whilst the A. of York is simply called Primate of England (*primus et metropolitanus Anglie*). It is also indicated by the places which they occupy in processions—the A. of Canterbury, who has precedence of all the nobility, not only preceding the A. of York, but the Lord Chancellor being interposed between them. Previous to the creation of an archbishopric in Ireland, the authority of the A. of Canterbury extended to that island. The amount of control which belongs to an A. over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese, or is guilty of immorality, the A. may call him to account, and even deprive him. In 1822, the A. of Armagh, who is primate of all Ireland, deposed the Bishop of Clogher on the latter ground. To the A. of Canterbury belongs the honour of placing the crown on the sovereign's head at his coronation; and the A. of York claims the like privilege in the case of the Queen-consort, whose perpetual chaplain he is. The province of the A. of York consists of the six northern counties, with Cheshire and Nottinghamshire. The rest of England and Wales form the province of the A. of Canterbury. The dioceses of the two archbishops—that is to say, the districts in which they exercise ordinary episcopal functions—were remodelled by 6 and 7 Will. IV. c. 77. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called 'peculiars'; with small districts in other dioceses, particularly London. The diocese of the A. of York embraces the county of York, except that portion of it now included in the dioceses of Ripon and Manchester; the whole county of Nottingham; and some other detached districts.

In Ireland, there are two Protestant and four Roman Catholic archbishops. Of the former, the A. of Armagh is primate of all Ireland; the A. of Dublin being primate of Ireland. They sit alternately in the House of Lords; the three bishops who, along with them, represent the Church of Ireland, being also chosen by rotation from the whole body. The election of an A. does not differ from that of a bishop (see **BISHOP**); but when he is invested with his office, he is said to be 'enthroned,' whereas a bishop is 'consecrated.' He also writes himself, 'by Divine Providence,' a bishop being, 'by Divine permission,' and has the title of 'Grace,' and 'Most Reverend Father in God,' whilst a bishop is styled 'Lord,' and 'Right Reverend Father in God.' The A. is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled up within six months; and every bishop, whether created or translated, is bound to make a legal conveyance to the A. of the next avoidance of one such dignity or benefice belonging to his see as the A. shall choose. This is called the A.'s option.

ARCHDEACON (Gr. *arch-*, and *diaconos*, servant). An ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The A. originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church, and directing the deacons in their duties. From being thus mere assistants, archdeacons in the 5th c. began to share the bishop's powers, and step by step attained to the authority which they now enjoy, which from the 9th c. became in many respects distinct from that of the bishop. Several synods protested against the innovation, but it was continued in the 11th and 12th centuries, when the archdeacons were recognised as the most influential of prelates. In the 13th c., their powers were limited by the establishment of episcopal courts. Their dignity and influence is now very much reduced in the Catholic Church. There were formerly sixty archdeaconries in England, but their number has been considerably increased since the passing of the act for carrying into effect the report of the Ecclesiastical Commissioners (6 and 7 Will. IV. c. 77); and it is probable that under the provisions of that act they may be still further increased. No person can be appointed an A. till he has been six years complete in priest's orders (3 and 4 Vict. c. 113, s. 27). The duty of parochial visitation has long been regarded as belonging specially to the archidiaconal office, and it was by its exercise mainly that the archdeacons attained to the dignity of ordinary instead of delegated jurisdiction. Even in performing this function, however, and in holding general synods or visitations, ordering repairs of churches, and the like, the A. is properly to be regarded as being what the canon law called him, 'the bishop's eye.' The judge of the A.'s court, when he does not preside, is called 'the official.' There is an appeal to the

Court of the Bishop, or in the case of an A. of an archbishopric, to the Court of Arches. See DEACON, DEAN, PRIEST. See also Cripps' *Law Relating to the Church and Clergy*. Edinburgh, 1857.

ARCHDUKE. A. and Archduchess are titles now taken by all the sons and daughters of the Emperor of Austria, and by their descendants through the male line. The title of A. was gradually assumed by the dukes of Austria, as a mark of precedence over the other dukes of the empire. Duke Rudolph IV. of Austria, in 1359, called himself Palatinus Archidux, but he was not so styled by the emperor. His brothers, Albert and Leopold, did not assume the title after his death, though they had occasionally done so in his lifetime. The third son of Leopold, however, Ernest-the-Iron, revived it. Still he was addressed by the emperor simply as duke. At last the title was formally conferred on them by the Emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift. Still the usage was not uniform, for he afterwards speaks of himself as duke. The privilege was extended to the Tyrolian branch of the Austrian House in the person of Sigismund. The value of the dignity thus assumed was a cause of contention with Bavaria in 1589. The Austrian view was, that to duke it held the same relation that archbishop does to bishop. The dukes of Austria claimed to have always had precedence over the other ducal houses, and regarded the title as a mere indication of what had been universally acknowledged. Bavaria, on the other hand, relied on the greater antiquity of its dukedom. The contest was decided by the Emperor Rudolph II. in favour of Austria, the precedence of which has not since been called in question. Other dukedoms claimed the privilege of being so called, but it was invariably denied by the emperor.

ARCHEGOSAURUS, a remarkable fossil batrachian reptile, so named by Goldfuss (*archegos*, leader;

Archegosaurus :

a, section of a tooth; b, scales.

and *sauros*, lizard), as constituting the real beginning of reptilian life, which had previously been considered as not extending below the Permian series of rocks.

From the engraving, it will be seen that the head of the A. is protected by a firm dermal skeleton, composed of numerous plates, which the internal primary cartilage seems to have continued unossified. The skull is flattened and triangular, with rounded angles, the front one being somewhat lengthened. The teeth are simple cones, having a labyrinthine structure similar to that of the recent *Lepidosteus*. The vertebral column remains in an embryonic condition; the arches and peripheral elements of the vertebrae are ossified; but the *chorda dorsalis*, which is persistent, is unprotected below. The ribs are short and almost straight, round and slender in the middle, expanded and flattened at the ends. The two pairs of limbs are nearly equal in size, and in structure very much resemble those of the *Proteus*. They

have each four long, slender digits, which obviously supported a longish, narrow-pointed paddle, adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales, which have been preserved in some specimens.

Four species have been described.

The history of the A. is shortly this: Its remains, found in the Bavarian coal-measures, had been described as those of a fish under the name of *Pygopterus Lucius* (Agassiz). In 1844, H. von Meyer first described it under the name of *Apateon pedestris*. This specimen was found in the coal-measures of Münster-Appel, in Rhenish Bavaria, and was supposed by Meyer to be related to the salamanders, and yet not without considerable doubt: for he says, 'its head might be that of a fish, as well as that of a lizard, or of a batrachian.' In 1847, Goldfuss figured and described three distinct species discovered in large concretionary nodules of clay-ironstone, from the coal field of Saarbrück,

giving to them the generic name of *A.* He considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Professor Owen has subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: it is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis*, and the branchial arches, and by the absence of the occipital condyle, or condyles, as in *Lepidosiren*, and by the presence of labyrinthine teeth, as in *Labyrinthodon*, which, however, also ally it to the ganoid *Lepidosteus*. This genus is represented in North America by two genera, *Amphibamus* (Cope) and *Colosteus* (Cope), the former from the Illinois, the latter from the Ohio, coal measures. Their skeletons are mostly cartilaginous. 3 species of *Colosteus* are known: the largest, *C. crassiscutatus*, had the belly protected by closely arranged osseous scales, and the limbs were very rudimental. Length, about 2 feet.

ARCHELAUS, one of the Heraclidae, who, when driven by his brothers from his native land, fled to Macedon, where he became the founder of a powerful family, of which Alexander the Great was said to be a descendant.—ARCHELAUS, natural son of the Macedonian king, Perdiccas II., came to the throne (after he had murdered the rightful heir) in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. Euripides and Zeuxis frequented his court; and the palace of the monarch was splendidly adorned by the paintings of the latter. It is said that Socrates refused an invitation to proceed thither, having no great respect for the character of A., which was stained with odious vices. He is believed to have been murdered by Craterus, one of his favourites; but the story of his death is told differently.—A., a general under Mithridates the Great, was sent into Greece with a large fleet and an army of 120,000 men to oppose the Romans in 87 B.C. Sulla was sent against him, and besieged him in Piræus, whence A. moved to Bœotia, and here collected all his forces. A battle took place at Charoneia, when victory declared for the Romans. A. now retreated to Chalcis, where he waited until Mithridates had dispatched another army of 80,000 men into Greece. The second fight took place at Orchomenos, in Bœotia, and, after two days' contest, the whole host led by A. was totally routed by Sulla. A., after hiding for three days in a morass, escaped to Chalcis. After a treaty of peace had been effected between Sulla and Mithridates, A. fell under the displeasure of his monarch, being unjustly suspected of treason, and, fearing for his life, as also perhaps disgusted at the return he had received for his many services, he went over to the Romans at the outbreak of the second war, in 81 B.C. After this time, he appears no more in history.—A., son of the former, married Berenice, daughter of King Ptolemæus Auletes (56 B.C.), and ruled over Egypt for the short space of six months during the banishment of Ptolemæus. The usurper lost his life in a battle against Aulus Gabinius, proconsul of Syria. His grandson, also named A., obtained from Marcus Antonius the province of Cappadocia, and retained it during the reign of Augustus. Tiberius accused him of political innovations, and condemned him to death; but, as he was old and fatuous, his life was spared. He died soon after his trial, at Rome, in 17 A.D.—A., son of Herod, the tyrant of Judea, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the

Pharisees. His heirship to the throne being disputed by his brother Antipas, A. went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judea, Samaria, and Idumæa. After a reign of nine years, he was deposed by Augustus, on account of his cruel tyranny, and banished to Vienna, in Gaul, where he died. His territories were added to the Roman province of Syria.

ARCHENHOLZ, JOHANN WILHELM, BARON VON, a German author, born Sep. 3, 1745, died Feb. 28, 1812. After service in the army, he gained his discharge at the close of the Seven Years' War, and passed several years in travel, visiting almost all the principal cities of Europe, and supporting himself by authorship, and, as it was generally reported, also by gambling. He wrote a *History of the Seven Years' War* (2 vols., Berlin, 1793), which, when compared with the generally dry style of his German contemporaries, deserves praise on account of its narrative interest. He also wrote *England and Italy* (2d edition, Leip. 1787), *Annals of British History* (1789—1798), and biographies of Queen Elizabeth of England, and Gustavus Vasa of Sweden.

ARCHER FISH, a name given to certain small East Indian fishes of the Acanthopterygious family of *Squamipennes* or *Chetodontidae*, which have the faculty of projecting drops of water with sure aim at insects, and thereby causing them to fall into the water, where they are instantly seized as prey. *Toxotes jaculator*, one of these species, is a fish about six or seven inches in length, a native of Java and other parts of the Indian Archipelago, and is that to which the name A. F. has been more strictly appropriated. It can project a drop of water to the height of four or five feet. It is the only known recent species of its genus, but there is a fossil one. *Chelmon rostratus*, also a Javanese fish, possesses the same power, and the Chinese in Java keep it in jars for their amusement, causing it to practise its art by placing insects within its range.

ARCHERS AND ARCHERY. Archers are soldiers whose weapons are the bow and arrow. Among the ancients specially eminent in this mode of warfare, we may particularise the Thracians, Cretans, Parthians, and Numidians; among the moderns, the Arabians, Germans, and Saracens. The Emperor Frederick II. employed Saracenic archers with great effect in his Lombard campaign; and to them is ascribed the victory at Cortenuova in 1237. The archers belonged to the light troops, and their province was to open the battle. The Emperor Leo especially lauded the dexterity of the Arabian archers. In later ages, the bow came to be employed in England, where the archers wore light armour, a short sword, and a quiver with twenty or more arrows. At first, these archers fought in small groups; in later years, in large masses. At the battle of Cressy, they formed in divisions of 4000 men, 200 in line and 400 deep. The archers decided the fate of the day in several battles—such as Cressy and Poitiers (1356), Agincourt (1415), Crévaux (1423), Verneuil (1424), and Roveryn (1429). The French archers never equalled the English, in spite of the pains Charles VI. and Charles VII. took with them. The latter organised in 1448 the *Franco-archers*, to which corps every parish had to contribute one man; but this measure was attended with so little success that the king was induced to take Scottish archers into his pay, to make any head against the English. The French archers wore a coat of buffalo-hide lined with strong linen, and were accompanied by shield-bearers. In this manner 2000 bowmen with their shield-bearers fought under the Count de Foix at the siege of Bayonne in 1451. The archers universally belonged

to the élite of the troops, and received higher pay than the rest. At one period, the arbalest or cross-bow was more in favour than the long-bow. See ARBALEST. Long after the discovery of gunpowder, we find the bow and arrow still used; as, for example, at the siege of Capua in 1500; and the siege of Peineburg in 1502. Nay, even in 1572, Queen Elizabeth promised to place at the disposal of Charles IX. 6000 men, of whom the half were archers. The English archers are the subject of frequent mention by our old writers. Chaucer, in his *Canterbury Tales*, speaks of the archer

‘Cladde in cote and hode of grene,
A sheefe of peacock arwes brighte and kene,
Under his belt he bare ful thiftillite,
Wel coude he dresse his takel yewmanlike,
His arwes drouped not with feileres lowe,
And in his hand he bare a mighty bowe.’

In a Treatise on Martial Discipline, by Ralph Smith, written in the time of Queen Elizabeth, we have a picture of the English archer two centuries after Chaucer's time: ‘Captens and officers should be skilful of that most noble weapon the long-bow; and to see that their soldiers, according to their draught and strength, have good bowes, well nocked, well strynged, everie stryng whippe in their nocke, and in the middes rubbed with wax braser, and shutting-glove, some spare strynges trymed as aforesaid; every man one shefe of arrows, with a case of leather defensible against the rayne, and in the same four-and-twentie arrowes, whereof eight of them should be lighter than the residue, to gall or astoyne the enemye with the hailshot of light arrowes before they shall come within the danger of their harquebus shot. Let every man have a brigandine or a little coat of plate, a skull or hufkyn, a maule of leade of five foote in lengthe, and a pike, and the same hanging by his girdle with a hook and a dagger.’

Among the Asiatic Turks, the Persians, the Tatars, and other nations of the east, as well as the American Indians, the bow and arrow are still used as weapons of war. In Europe, they are nearly abandoned for military purposes. The chief differences between the two kinds of weapon employed by the archers of the middle ages are noticed under ARBALEST; BOW AND ARROW.

Although archers are still included among the fighting-men of barbarous and semi-barbarous nations; in England, archery is now nothing more than a pastime, encouraged by archery clubs or societies. In this sense, however, archery is experiencing a revival, being healthful as an out-door exercise, even if no further useful. During the reign of Charles II., archery was much patronised by the court, Tothill Fields being the chief scene of exercise. After his reign, archery fell into desuetude for about a century. In 1776, a Mr. Ashton revived archery in the neighbourhood of London; and very shortly there were several toxophilite or archery societies formed. The system survived till 1793, when another period of inactivity supervened, lasting till 1844. In this last-named year, archery was revived in Yorkshire, and has since gone on extending every year. A recommendation to the sport is that ladies can take part in it—one of the few open-air pastimes of which this can be said. In the modern exercise of archery, there are several varieties of contests between the antagonistic parties; but the usual variety is target-shooting. In archery-matches, a number of prizes are generally awarded, the principal being for the greatest number of arrows shot into any part of the target, and for the nearest approach to the exact centre. The target has a gold spot in the centre, a red ring around this, then a white ring, then a black, and

outside of all a white ring bordered with green. The merit of the shooting consists in a near approach to the exact centre or ‘gold.’ Two targets are generally used in a match, on opposite sides of the field, each by one party. The apparatus mostly used at these archery meetings is represented in the

Archery Apparatus.

annexed cut. 1 is the bow, varying in weight according to the strength of the person who is to use it; 2 is the arrow; 3 is the quiver, a tin case for holding arrows not immediately in use; 4 and 5 are the pouch and belt for holding the arrows actually in use. The tassel of the belt serves to clean the arrows when dusty. 6 is the brace, buckled round the left arm, to protect it from being hurt by the string when shooting; 7 is the shooting-glove, formed to protect the three fingers used in drawing the string. Besides these articles and the target, archers are sometimes provided with a large case called an ‘ascham,’ fitted up with the necessary drawers and compartments for the reception of the bow, arrows, string, and other necessary accoutrements.

In archery competition, the total number and value of each person's hits are registered on a scoring-card. The shots are usually punctured on a card with a pin, as being preferable to pencil or ink marks; and the mode of ascertaining the value of the hits, which is increased in proportion as they reach the centre, will be seen by the following example:

FORM OF THE SCORING-CARD.

Names.	Gold.	Red.	Inner White.	Black.	Outer White.	Total.	Value.
A	..					35	68
B	.	..				26	48

It appears by the card that A has two in the gold, four in the red, six in the inner white, ten in the black, and thirteen in the outer white, making a total of thirty-five. The real value of these is ascertained by multiplying the hits in the gold by nine; in the red, by three; in the inner white, by two; by adding a fourth to those in the black, and leaving without alteration the number in the outer white. By this process it will appear that A's numbers, according to the value of each circle, amount to 68, and B's to 48—hence A is the winner by 20. But A's total might have been less than B's, and still he might have been the winner, providing the shots had lain more towards the gold than B's.

As an instance of the skill which long and careful practice may insure, Mr. Horace A. Ford, who has written an excellent work on Archery, on one occasion, out of 144 shots, made 143 hits—765 score; on another, 144 shots, 137 hits—809 score; and on another, 75 shots, 75 hits—555 score.

ARCHIL, or O'ARCHIL, is a colouring substance obtained from various species of lichens. The A. is not originally present in the lichen, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a powder with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added; when, by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-coloured matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. The lichens which yield the best A. in largest quantity, are *Rocella tinctoria* and *fuciformis*. The former is called the *Archil* plant, and is obtained in large amount from the Canaries and Cape de Verd Islands, and the Levant. Another lichen, *Lecanora tartarea*, collected from rocks in Sweden, is largely imported into Britain. It is sometimes called cudbear (q. v.), or cudbear lichen, and sometimes white Swedish moss. A. is soluble in water and in alcohol, to either of which it imparts a violet colour, with a good deal of a crimson hue. It is much employed in the dyeing of silks, where a beautiful lilac colour is required; but though a brilliant rich hue is imparted to the silken fabric, the colour is not a permanent one, being easily acted upon by the rays of the sun. Hence the A. is seldom used by itself, and the cloth is first dyed lilac by another colouring matter, and is then passed through an A. dye, which imparts a brilliant lilac hue to the cloth. A. is seldom employed to dye cotton cloth, but it is often used, along with indigo, in the dyeing of woollen cloth; and besides enabling the indigo colour to go much further, it imparts its peculiar rich tint to the blue or black cloth or yarn immersed in it; the colour, however, so obtained is not so permanent as where the A. is left out. Cudbear (q. v.) and Litmus (q. v.) are analogous to A., and are obtained from the same lichens.

The lichen distinguished by the name of the A. plant or lichen, *Rocella tinctoria*, grows very sparingly on the southern coasts of England, but abundantly on the shores of the Mediterranean and of the neighbouring parts of the Atlantic, where it often covers rocks near the sea, so as to form what has been likened to a sort of turf upon them. The Spanish name is *Orciglia*, from which the French *Orseille*, the English A. or Orchil, and even the botanical name *Rocella*, are derived. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner; of a grayish brown colour, with powdery warts (*soredia*); the *apothecia* (q. v.) orbicular, flat, horny, almost black, with a scarcely prominent border. That from the Canary Isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and about an inch and a half in length. A less branched and more slender, prostrate, or pendulous variety (*Rocella hypomecha* of Bory de St. Vincent) is common at the Cape of Good Hope and in the island of Mauritius, and appears in commerce along with the other, but is of very inferior quality. A variety remarkable for its large size, or perhaps a distinct species (*R. flaccida*), is brought from Lima and other parts of the west coast of South America;

it is sometimes as thick as a goose-quill, and 6 or 8 inches long, and is of excellent quality. All these, and *Rocella fuciformis*, very generally receive in commerce, and from A.-makers, the name of Orchella weed, the different kinds being distinguished according to the countries from which they are imported. They are also popularly called Dyer's Moss.—*R. fuciformis* now yields perhaps more of the A. or Orchella weed of commerce than *R. tinctoria*. It differs from *R. tinctoria* chiefly in being not rounded, but flat, and in having the *apothecia* very distinctly bordered. It grows in similar situations, and is also a native of Britain, but abundant only in warmer climates, as on the coasts of Africa, Madagascar, &c. That from Angola is reckoned of the very best quality.

Among the lichens from which A. is manufactured is the *Porille d'Auvergne* or *Orseille de terre* (Ground A.) of the French, *Variolaria oreina* or *corallina*, which is gathered for this purpose in mountainous districts of the south of France and other parts of the south of Europe, and is also an article of export (with other similar lichens) from Sweden to Holland. But the greater facility with which A. of the finest quality can be procured from the species of *Rocella*, and the increasing abundance of the supply from different quarters, particularly from Angola, tend to diminish the demand for other lichens.

ARCHILOCHUS of PAROS, in Lydia, flourished about 714—676 B. C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is claimed for Callinus, a writer whose age seems to have slightly preceded that of A. Glimpses of his life, especially of the calamities which befell him, were frequently given in his writings. His father's name was Telesicles, his mother was a slave called *Enipo*. At an early age, becoming entangled in political contests, he abandoned his native town, and led a colony of the citizens to Thasos. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians, yet not through cowardice. Subsequently he was banished from Sparta, to which he had gone, some say because he had vindicated his conduct in running away from the fight, others, because of the licentiousness of his verses. He is said to have gained the laurel-wreath at the Olympic Games by an ode in honour of Hercules, but this is doubtful. Having returned to Paros, he took part in the war which broke out betwixt it and Naxos, in the course of which he lost his life, either in battle or by assassination. The Delphian oracle pronounced a curse upon his slayer. Variety, novelty, and satirical bitterness characterised his lyric poems; so much so, that 'Archilochian bitterness,' and 'Parian verse,' became by-words in ancient times. He scourged his enemies in the most merciless fashion, and always displayed the most malicious skill in selecting for his sarcasm the points on which they were most sensitive. It is said that Lycambes, who had promised his daughter Neobule in marriage to A., having failed to fulfil the promise, was so severely satirised by the poet, that, to escape ridicule, both father and daughter hanged themselves. Among the ancients, A. was ranked with Homer. They dedicated the statues of both on the same day, and placed the head of A. beside that of Homer on the same bust. It is therefore supposed, and with high probability, that there must have been far more in A. than mere vehemence of satire. Even Plato, who was not likely to err on the side of admiration in such a case, calls him 'the very wise;' and Gorgias, the rhetorician, is reported to have said, when Plato sent forth his dialogues against the Sophists, 'Athens has given birth to a new A.' There must have been strong sense,

and a keen perception of truth in the man, to have won so universal and permanent a reputation. Still the line of Horace—who was a vigorous imitator of him in many respects—proves that 'rage' was considered 'the special faculty' of A.

'*Archilochum proprio rabies armavit iambus.*'

Ars Poetica, line 79.

'Rage hath armed Archilochus with his own iambus.'

The word *iambus* was in use before the time of A., and was employed to denote a species of rude railery, such as flashed out spontaneously under the inspiring excitement of the Bacchic and other festivals. A. was, however, the first to reduce these irregular and capricious effusions to fixed rules. See *IAMBICS*. The semi-pentameter, of which he made abundant use, was called after him *Archilochian verse*.

The fragments extant of his poetry have been edited by Bergk in his *Poetæ Lyrici Græcorum* (Leipsic, 1843).

ARCHIMANDRITE (Gr. *archi-*, chief, and *mandra*, a fold or a convent), the title of the highest order of superiors of convents in the Greek Church (see *ABBOT*). The Russian bishops are chosen from among the archimandrites.

ARCHIMEDES, the most celebrated of ancient mathematicians, was born at Syracuse about 287 B. C. He is said to have been a kinsman of King Hiero, though he does not seem to have held any public office, but devoted himself entirely to science. In regard to mathematics, we cannot estimate fully the merits of A. without a more exact knowledge of the state of the science as he found it; we know, however, that he enriched it with discoveries of the highest importance, on which modern mathematicians have founded their methods of measuring curved surfaces and solids. Euclid only considers a few curved figures in relation to one another, but without comparing them with rectilinear surfaces and solids. The theorems necessary to this transition are laid down by A. in his treatises 'on the Sphere and Cylinder,' 'on Spheroids and Conoids,' and 'on the Measurement of the Circle.' His demonstration that the area of a segment of a parabola is two-thirds of the enclosing parallelogram, is the first real example of the quadrature (q. v.) of a curvilinear space. In his treatise on spirals, he rises to yet higher investigations, which, however, are not very easily understood even by masters of the subject.

A. is the only one of the ancients that contributed anything satisfactory on the theory of mechanics and on hydrostatics. He first established the truth, that a body plunged in a fluid loses as much of its weight as is equal to the weight of an equal volume of the fluid. (See the following article.) It was by this law that he determined how much alloy the goldsmith, whom Hiero had commissioned to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to hasten home without waiting to dress, exclaiming: 'I have found it! I have found it!' (*Eureka! Eureka!*) Practical mechanism seems to have been an equally new science in the days of A.; for his boast, that if he had a fulcrum or stand-point, he could move the world, betrays the enthusiasm with which the extraordinary effects of his newly invented machines inspired him. Among the numerous inventions ascribed to A., is that of the endless screw, and the *cochlea* or water-screw (see *ARCHIMIDES' SCREW*), in which the water is made in a manner to ascend by its own gravity. During the siege of Syracuse by the Romans, he exerted all his ingenuity in the defence of the city. Polybius, Livy,

and Plutarch speak with astonishment of the machines with which he opposed the attacks of the enemy. But while giving detailed accounts of his other contrivances, they say nothing of his having set fire to the ships by means of mirrors, a story which is not very probable in itself, and rests on later narratives. When the Romans took the city by surprise (212 B. C.), A., according to the tradition, was sitting in the public square lost in thought, with all sorts of geometrical figures before him drawn in the sand. As a Roman soldier rushed upon him, he called out to him not to spoil the circle! But the rude warrior cut him down. According to his own direction, a cylinder enclosing a sphere was engraved upon his tombstone, in commemoration of his discovery of the relation between these solids—a discovery on which he set particular value. When Cicero was in Sicily as questor, he discovered the tomb hid among briars. His collected extant works were edited by Torelli (Oxf. 1792). There is a French translation with notes by F. Peyrard (Paris, 1808, 2 vols.), and one in German by Nizze (Strals. 1824). The *Arenarius* was translated into English by G. Anderson (Lond. 1784). The object of the treatise is to prove that it is possible to assign a number greater than that of the grains of sand that would fill the sphere of the fixed stars, the diameter of which A. assumes at a certain number of stadia. The difficulty lay in expressing such a vast number by means of the clumsy notation of Greek arithmetic, and the device by which the difficulty is eluded is considered as affording a striking instance of A.'s genius.

ARCHIMEDES, the **PRINCIPLE OF**, is one of the most important in the science of Hydrostatics, and is so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body when immersed in a fluid loses exactly as much of its weight as is equal to the weight of the fluid it displaces; or: A fluid sustains as much of the weight of a body immersed in it as is equal to the weight of the fluid displaced by it. It is proved experimentally in the following way. A delicate balance is so arranged that two brass cylinders, A and B, may be suspended from one of the scale-pans,

the one under the other. The lower cylinder, B, is solid, or closed all round, and fits accurately into the upper cylinder, A, which is hollow. When the two cylinders are placed under the one scale, pan-weights are placed upon the other until perfect equilibrium is obtained. The cylinder B is now immersed in water, and in consequence of the buoyant tendency of the water exerted upon it, the equilibrium is destroyed; but it may be completely restored by filling the hollow cylinder, A, with water. The amount of weight which B has lost by being placed in the water, is thus found to be exactly the same as the weight of a quantity of water equal to its own bulk, or which is the same thing, to the quantity of

water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves, they swim on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely the same as they do. The pretty scientific toy called the Cartesian Diver is intended to illustrate this. Although the principle of Archimedes is generally established with reference to water, its application extends equally to bodies immersed in air or any other fluid.

ARCHIMEDES' SCREW (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Fig. 1 represents it in its simplest form. This consists of a

Fig. 1.

flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. In the position represented in the figure, the lowest bend (*a*) of the tube will be filled with water, and if now the handle be made to turn in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water enclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend, *b*. The first bend (*a*) has meanwhile received a second charge, which, after a second revolution, flows up into the second bend (*b*), and takes the place of the first charge, which has now moved up to the third bend, *c*. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen from the figure that there is room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is hollowed out into a double or triple threaded screw, and enclosed in a water-tight case, which turns round with it, the space between the threads supply-

ing the place of such tubes as are seen in Fig. 1. Fig. 2 represents a double-threaded A. S. of this description, with the case removed in front. It is sometimes found convenient to fix the exterior envelope,

Fig. 2.

and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact. This modification of the A. S. receives the name of water-screw, and frequently of Dutch screw, from its being extensively used in Holland for draining low grounds.

ARCHIPELAGO, a term (of doubtful etymology) applied originally to that gulf of the Mediterranean which separates Greece from Asia; but now extended to any sea, like it, thickly interspersed with islands, or rather to the group of islands themselves. The islands in the Greek Archipelago or *Ægean Sea* consist of two groups, called *Cyclades* and *Sporades*; the first from their being massed after the manner of a circle, the second from their being scattered in something of a line. The former lie to the east of Southern Greece, while the latter skirt the west of Asia Minor.

Of the *Cyclades* the principal islands are: *Lyra*, *Kythnos*, *Thera*, *Tenos*, *Andros*, *Naxos*, *Melos*, and many more of inferior size. They all belong to *Greece*, and will more conveniently be considered in connection with it. The chief islands of the *Sporades* are: *Scarpanto*, *Rhodes*, *Cos*, *Patmos*, *Nicaria*, *Samos*, *Seio*, *Metelin*, *Lemnos*, *Imbros*, *Samothraki*, *Thasos*, and many more of inferior size. They will fall to be considered under the head of *Turkey*, to which they still belong. Of both groups, the more considerable islands will be noticed, under the alphabetical arrangement, in their respective places.

The other Archipelagoes, loosely so called, will receive separate notice each in its proper place.

A remarkable circumstance may be mentioned in connection with Archipelagoes. The islands of the globe rarely stand alone. With very few exceptions, they may all be classified into clusters. In most clusters, again, there is generally more or less of similitude between the different members of each—similitude sometimes of one kind, and sometimes of another. Perhaps the similitude that is most obvious even on the face of an ordinary map, is that, really like the links of a chain, the members of a cluster have their lengths, as distinguished from their breadths, in one and the same direction. In the West Indies, for instance, look at the *Bahamas*, and look also at the *Antilles*, Greater and Lesser. In the East Indies, again, the same thing is seen in carrying the eye from the north end of the *Philippines* to the north end of *Sumatra*, or even of the *Andamans*. Lastly on the opposite coasts of the Upper Pacific, observe the American side upwards from the south end of *Vancouver's Island* to *Mount St. Elias*, and the Asiatic side downwards from the upper extremity of *Kamchatka*—which is all but an island—through the *Kuriles*, to the lower extremity of *Japan*.

ARCHITECTURAL PAINTING has for its subjects the exteriors or interiors of remarkable buildings; churches, castles, streets in cities, &c. It is mentioned by Vitruvius, but is comparatively a modern art. Benozzo Gozzoli, Ghirlandajo, and the Venetian school, cultivated this department of art in the middle ages; and Pinturicchio, by order of Pope Innocent VIII., painted a series of views of cities in the style of the Flemish school, which, under the brothers Van Eyck, had distinguished itself by careful treatment of architectural backgrounds, &c. For a long time, A. P. was regarded only as accessory to other styles of art; but, at the close of the 16th c., P. Neefs, in his views of the interiors of Gothic churches, gave to this branch of the fine arts an independent form; and Steenwyck the younger, in the following century, extended its application in his views of the interiors of prisons, of which his picture of 'Peter Liberated from Prison' is an example. The art was still further extended and cultivated by Van der Heijden, Blick, Van Deelen, E. de Ville, Johann Ghering, and others, who painted views of church interiors in the Italian style, palaces, and chambers. The interior view of the Church of Amsterdam, painted by Ruisdael, deserves especial notice. In the 18th c., the Venetian Canale and his nephew Bellotto (generally known by the name of Canaletto), painted many views of cities, but especially of the canals and buildings of Venice. Collections of their numerous works are found at Dresden, Woburn Abbey, &c.

In recent times, A. P. has been very successfully cultivated in Germany, France, England, Holland, and Belgium. Schinkel is celebrated for his fine union of classical taste with richness of decorative invention. His two most striking works are St. Peter's, and the Duomo at Milan; Paul Gropius has shewn great talent in his Cathedral at Rheims, built in honour of Joan of Arc. His dioramas are well known; and Domenico Quaglio, who died in 1837, throughout his innumerable compositions, has exhibited an exquisite appreciation of perspective, and of the poetical arrangement of details. Among modern A. painters may be mentioned—in England, Prout (views of Italy, Germany, &c.), Roberts (whose genius has sought for its materials in Spain and the East, and who paints the architecture of foreign lands with rare truthfulness and lively vigour), Mackenzie, Goodall, Williams, and the water-colour painters Haghe, Chase, Howse, and others; in France—Granet (died 1849), the most celebrated art painter of the new French school; and the water-colour painters Ouvrié, Garnery, Rochebrune, and Villeret; in Italy—Migliara and Nehrlich (a German, who has been styled 'the modern Canaletto'); in Germany—Von Bayer, Hasenpflug of Halberstadt (who paints beautifully old cloister-alleys under winter-effects), Aimmüller, Vermeersch, Pulian of Düsseldorf (who displays great skill in the representation of old streets and time-worn churches), Conrad, Gärtner, Gröb, Helfft, Dietrich, &c.; in Holland and Belgium—Waldorp, Carsen, Boosborn, Von Haanen, Ten Kate, Springer, and Bossuet.

ARCHITECTURE (Lat. *architectura*, from the Gr. *architectōn*, the chief fabricator, the architect), the art of building or constructing. In this country, A. is usually divided into Civil, Military, and Naval. In the present article we shall confine ourselves to the first, the two latter being treated of, the former under the head of FORTIFICATION, the latter under that of SHIP-BUILDING. Civil A., when taken in the widest sense, may be regarded either from an artistic, a scientific, or a utilitarian point of view. In the first case, as a means of giving external form and sensible expression to mental conceptions or

ideas, it is a branch of æsthetics, or of the fine arts properly so called (see ART), and takes rank with sculpture and painting; in the second case, it consists in a knowledge of certain laws of physical nature, and a consequent power of calling them into play, or counteracting their operation, and is consequently, a branch of that wider department of science to which the name of *Mechanics* (q. v.) is given; whereas in the last it becomes a practical art, which has for its object the application of the principles, both artistic and scientific, which A. embraces, to the elevation of national and individual character, and the increase of the physical comfort and well-being of mankind. But though it admits of being thus analysed or separated in thought, it must not be imagined that A. can exhibit in practice any one of these principles to the exclusion of the others. The abstract conception of all-pervading deity, as embodied in the Greek temple—the religious aspiration after a personal god, as shadowed forth in the Gothic cathedral—can be realized only in accordance with the principles of mechanics, and the most rigorous adaptation of means to ends; whereas, in an opposite direction, the kraal of the Hottentot, the hut of the Indian in the American wilderness, or even the vulgar chimney-stalk in the dingy manufacturing suburb, if properly constructed for their respective purposes, will be found to have obeyed such æsthetical principles as they may have come in contact with. Nature is not self-contradictory; and art and science, beauty and utility, when rightly understood, are never in conflict. A celebrated German writer and thinker (F. Schlegel) has described A. as 'frozen music'; and the comparison is in accordance with the remarks which we have made; for music, though apparently the freest and most lawless, is in reality the most rigorously scientific of the arts. But though a strict adherence to all the principles of A. be indispensable to every genuine architectural structure, whatever be its object, it by no means follows that equal prominence must be given to each of these principles on every occasion. If a building has for its primary object the expression and commemoration of such feelings as grief, gratitude, devotion, or the like, this object manifestly will be best obtained by subordinating the scientific and utilitarian to the æsthetic principles of A.; and the reverse will be the case where mere convenience, and also, though in a lesser degree, where convenience, in combination with beauty or magnificence, is sought. It is in a great measure by the prominence which they have given to one or other of these principles, that different nations have displayed their diversities of character in their A. The speculative and poetical character of the Greeks was exhibited in their temples, whilst their preference of the state to the individual appeared in the fact that these structures were designed for the worship of the protecting divinity of the city by the citizen, not for the worship of a personal god by the individual man. Amongst the Romans, again, terrestrial power and material aggrandisement were the exclusively national aspirations, and consequently their A. had their own honour and glory primarily in view. The basilicas, amphitheatres, and triumphal arches of the Romans were their own; but the temples which they raised in honour of the gods, were little else than imperfect copies from the Greek, with scarcely any assignable national characteristics. Then, when we come to medieval times, though, on the revival of spiritual tendencies, æsthetic principles again become prominent, they exhibit themselves under totally different forms; and the distinctions between heathen and Christian thought could scarcely be more distinctly stated in words than they are exhibited to the eye in the

difference between a Greek temple and a Gothic cathedral. Even the relation which subsists between Christian and Mohammedan A. (Gothic A. and Arabian A., q. v.) strikingly reminds us of the fact that Mohammedanism was but a sort of bastard Christianity. Domestic life again appeared in full purity and vigour only in modern times; and then only do we see the the utilitarian principles of A. finally prevailing over the æsthetic. But apart from the mental characteristics and tendencies of a people, there are many other circumstances which modify their A. Of these, one of the most important is climate. Arrangements for the permanent and commodious residence of the family within doors could not be expected to attain much perfection amongst a race like the Greeks, whose life was spent in the open air; and the climate of Holland, as well as the genius of the people, and the character of their occupations, has had much to do with the fact that the Dutch have rarely risen above a town house. Following thus the peculiarities of national character and circumstances, it is obvious that the more widely these differ in any two nations, the more dissimilar will be the styles of A. which they produce respectively. Moreover, it is apparent that the higher the stage of national development, the more marked will be the character which the A. of a people will assume. A. thus bears a strict analogy to language. Both are an expression of thought, and in the one and in the other, the richness, variety, and precision of the expression will be in proportion to the quantity and quality of the thought to be expressed. Lastly, in the fact that all genuine A. is the expression of the ruling national ideas and forms of thought of some one particular people, we perceive the reason why a building compounded of several styles should be characterless and unpleasing; and why this should be more and more the case, the more characteristic the styles compounded, and the greater the equality preserved amongst them. The Doric pillar in itself, and still more, perhaps, the Roman adaptation of it, is the simplest and most rudimentary of all pillars; and what we are in the habit of calling Saxon, is the simplest and most rudimentary of all the styles of Gothic A.; and hence the introduction of a few Tuscan pillars considerably modified into a Saxon or Romanic church, does not awaken feelings of very decided repugnance, whereas an attempt to combine equally the beauties of the Parthenon and of Cologne Cathedral in the same building would be unpeakably revolting. The limits of the present article preclude us from presenting to the reader a consecutive account of the origin and development of the different styles of A. These will be treated under separate heads (see EGYPTIAN A., INDIAN A., GREEK A., GOTHIC A., ARABIAN A.; see also ARCH, PILLAR, ARCHITRAVE, &c.); and all that can be here attempted is to trace the earlier stages through which A. passed in the historical nations, before it reached the point at which it afforded the means of expressing the feelings or supplying the wants of mankind.

1. The earliest stage of monumental A. in every part of the world seems to have been that in which it supplied to the existing generation the means of setting a mark on the face of the earth, of a nature so ineffaceable as that it should continue to be visible to future generations. No attempt was yet made to tell a tale either by the form of the monument, or by any figure or inscription engraven on it. Apart from the tradition intended to accompany it, it was speechless—confessedly unintelligible. But it is easy to see how powerful would be the effect of such an erection in preserving that tradition from oblivion, and fixing it down to the particular locality; for so long as a conspicuous object

existed, which obviously was the work of human hands, the cause of its existence would be a subject of curiosity, which could be gratified only by inquiries which must lead to a recital of the events intended to be commemorated. It was with this view that Joshua (xxiv. 26) took a stone, and set it up under an oak that was by the sanctuary of the Lord—'And said unto all the people: Behold, this stone shall be a witness unto us; for it hath heard all the words of the Lord.' To this primary class of monuments belong those tumuli or barrows, and conical heaps of stones called cairns, carns, or karns, which, when they occur in Britain, we perhaps rightly ascribe to the Celtic portion of our forefathers, but which there is much reason to believe have been erected by every race at a certain stage of their progress. The barrow, it is true, is not wholly destitute of architectural arrangements. Occasionally it contains a passage or narrow gallery leading to a square enclosure or small chamber, in which the remains of bones, and of rude urns, drinking cups, and other articles, sometimes of Roman or Brito-Roman manufacture, are found. The barrows are always, however, of the rudest and most artificial construction, and in considering them, we are only, as it were, on the threshold of architectural science.

2. The earliest class of erections to which this title can with any propriety be given, are those which are commonly spoken of as Druidical temples. These consist generally of separate stones, often of enormous size, raised on their ends, sometimes in a circle, and at other times so as to enclose an oblong space, which in some cases is roofed in by horizontal slabs. These roofing-stones are frequently of such prodigious weight as to give rise to many conjectures regarding the mechanical means by which, and the mechanical knowledge of those by whom, they were placed in the positions in which we see them. These strange, and, to us, almost wholly unintelligible remains of antiquity, when of great extent, assume an air of savage and gloomy majesty. Of this the most conspicuous instance anywhere to be found is that of Stonehenge (q. v.), in Salisbury Plain in Wiltshire. Wherever a Celtic population existed, these monuments are to be found. Druidical monuments are more common in France than in England; and in France, as might be expected, they exist in the greatest numbers and variety in Brittany (q. v.), though none of them approach the magnitude, or, in some respects, the workmanship of Stonehenge. The Celtic monuments of Brittany are of different classes, and have received different names—that which is most architectural in character being the dolmen, or cromlech, as it is called in England. The cromlech consists generally of two rows of perpendicular stones, arranged so as to fit pretty closely to each other, and covered with horizontal roofing slabs, thus forming a chamber, which is generally of such height as to allow a man to walk through it upright. But the largest and most perfect specimen of the dolmen is to be seen, not in Brittany, but in the neighbourhood of Saumur on the Loire. It measures more than 80 feet in length. To the same early stage in the science, though probably to a much earlier period in point of time, are to be referred those cyclopean walls and fortifications which at Tyrrus and Mycenæ in Argolis excited the wonder of the later Greeks; the Etruscan walls at Fiesole; and the similar structures which are found both in Central and South America.

3. The next stage in advance of that primeval and pre-historic one of which the traces are thus so widely spread, is that at which the science seems to have culminated in all but the classical nations of

antiquity, and those races which have had the benefit of their genius and invention. We have here an accurate measurement of parts, and a corresponding division of the building. The pillar also makes its appearance, though it is by no means used with the same freedom, nor does it exhibit the same variety of form to which it attained in Greek A. The stage of which we here speak was attained by the inhabitants of Central and Southern America before its discovery by Europeans; and in Mexico, even by the Toltecs, an earlier race, which had given way before the Mexicans of the days of Cortes. Peruvian A. exhibits neither columns nor arches; but the remains of the palace at Mitla possessed a portico with plain cylindrical columns; and the walls were covered with rude sculpture. In the cloisters of a building at Palenque, a species of inartificial triangular arch, formed by courses of stones projecting over each other, was found. It is very instructive as showing the natural, and, so to speak, necessary character of certain architectural forms at certain stages of national development, to find that the pyramid, which is little more than a regularly constructed cairn, is met with even more frequently in Mexico, than in Egypt; and whether or not we regard it as the primary form of the pagoda of India, it certainly formed the basis both of Mexican and Egyptian A. The discussions which have been carried on with so much keenness as to the priority of date of Indian and Egyptian A., lose much of their importance when we find a race, acting in all probability independently of both, starting from the same primary form as the one, and in the discovery of the pillar and the arch, making two of the most important of the further steps in advance to which they respectively lay claim. Keeping these facts in view, it would seem, moreover, that something more is required to prove an historical connection between Doric and Egyptian A. than the circumstance that the columns which they respectively employ possess a base, a shaft, and a capital, or that both are used to support an entablature. Even the long unbroken horizontal lines which seem to indicate an affinity between the architectural styles of Egypt and of Greece, and which distinguish them both so sharply from the Christian A. of medieval Europe, may be the result rather of a similarity of circumstances than an identity of origin. Though these styles agree in having columns, and though the columns support horizontal entablatures in each, they disagree in the forms of the columns, in the character of the entablature, and indeed, in almost every other particular. Whilst Greek pillars taper towards the top, and the walls are vertical, in Egyptian buildings the very reverse is the case, the pillars being vertical, and the walls sloped. When the effect of a whole Greek building, surrounded by a colonnade, and of an Egyptian building is considered, a certain similarity appears—the base in each case being wider than the upper part; but the result is produced in the one case by sloping the pillars, and in the other, by sloping the walls, the external edges of which form a slightly acute angle with the base of the building. The great distinction, however, between the A. of Egypt and Greece consists in the stages which they respectively reached. The A. of Egypt retained throughout a character of gloomy strength, and never attained to the lightness, freedom, or variety of that of Greece. In the one case, the traditional forms continued throughout to dominate and subdue the free spirit of art; in the latter, art triumphed over tradition, and owned no laws but its own. It is in this circumstance that the distinction consists between the stage of A. of which Egyptian may be considered the type, and of which Assyrian, Babylonian, and Persian A. are also examples, and

that ultimate stage which was reached by the Greeks in one direction and by the various Germanic nations in another. See ARABIAN A., BYZANTINE A., and GOTHIC A.

ARCHITRAVE (Gr. *archi*, chief; Lat. *trabs*, beam), the lowest part of the entablature (q. v.), of that which rests immediately upon the columns.

ARCHIVES. See RECORDS.

ARCHIVOLT, the ornamental band or moulding which runs round the lower part of the voussoirs of an arch.

ARCHON, the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q. v.), the Athenians, according to the traditionary account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title A. (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C., the time of office was limited to ten years; and in 714, the exclusive claims of Medon's family to the office of A. were abrogated, and it was thrown open to all persons of noble birth; afterwards to all citizens, without distinction of rank (477 B.C.). In 683, the office had been made annual, and the number of archons had been extended to nine. The year was named from the first A.; to the second, styled *Basileus*, belonged the care of religious affairs; the third was *Polemarchos*, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled *Thesmothetæ*, or lawgivers.—Among the Jews, during the time of their subjection to the Romans, the title of A. had various meanings; but was generally given to the members of the Sanhedrim or supreme council.—In the mystical jargon of the Gnostics, the term A. was frequently employed, and hence one of their sects, especially opposed to Judaism, received the name of ARCHONTICS. See GNOSTICS.

ARCHYTAS of Tarentum, one of the most illustrious men of antiquity, flourished about the year 400 B.C. His father's name was Mnesagoras. A. is said to have been a contemporary of Plato, and on one occasion to have saved the life of the latter when the tyrant Dionysius wished to put him to death. His public career was glorious. He was seven times elected general of his city, though it was customary for the office to be held only for one year; and in every campaign which he undertook, he was victorious. His civil administration was equally fortunate. Affairs of the highest moment were repeatedly intrusted to him; and yet, though deeply skilled in philosophy and politics, he was possessed of a childlike simplicity of character. He was drowned on the Apulian coast. A.'s virtues were as conspicuous as his talents. He paid the most humane attention to the comfort and education of his slaves, and although one of the greatest geometers, he did not disdain to make a rattle for the amusement of his children. He solved the problem of the doubling of the cube, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is generally supposed to have exerted a considerable influence on Plato, and some affirm that even the gigantic understanding of Aristotle was indebted to him for the idea of his categories. Only fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics.

ARCIS-SUR-AUBE, a small town in the French department of Aube, situated in lat. 48° 32' N., long. 4° 8' E., contains 2719 inhabitants, and is remarkable on account of the battle fought here, March 20, 21, 1814, between Napoleon and the

allied forces under Prince Schwartzberg. The battle, beginning with several skirmishes on the first, and ending in a general engagement on the second day, when the French retreated over the Aube, was not in itself very important. But Napoleon now formed the plan of operating in the rear of the Allies, and left the road to Paris open; assuming that they would not venture to proceed without attempting first to secure their rear. The Allies marched, nevertheless, on the capital, and thus decided the campaign.

ARCOLA, or ARCOLÉ, a village on the left bank of the Adige, in northern Italy, 13 miles E.S.E. of Verona, famous for the victory gained by Bonaparte over the Austrians, 17th November 1796. The Austrians, relieved by the retreat of Moreau from the Rhine, had begun to take the offensive in Italy, and General Alvinzy appeared at the head of 50,000 men, with the main body of which he advanced to Caldiero, and threatened Verona. Bonaparte, recognising the danger, descended by night the course of the Adige, crossed that river at Ronco, and was thus in a position to threaten the left flank of Alvinzy's army, which was posted at A. A causeway leads from Ronco across the morasses to A., before reaching which, the road crosses the small stream of the Alpon by a narrow bridge. This bridge was defended by the Austrian general, Mitrowsky, with fourteen battalions of infantry, and two squadrons of cavalry. On the 14th of November, Augereau attacked the bridge with two battalions of grenadiers, but being exposed in flank to the Austrian fire, was obliged to withdraw. Bonaparte now seized the standard himself, and rushed on the bridge, followed by the grenadiers; but again the fire of the Austrians, who were in much greater force than the French, made it necessary to draw back. The struggle was renewed on the 16th, with a similar result; and it was only on the 17th that the French succeeded in getting possession of A., not, however, by forcing the bridge, but by sending a column across the Alpon, lower down, and getting in rear of the Austrians. On this Alvinzy was obliged to retreat to Vicenza. It fared no better with the other column of the Austrians under Davidovich. In this series of battles the Austrians lost 18,000 men killed, and 6000 prisoners. The French loss was 15,000.

ARÇON, JEAN CLAUDE D', a distinguished French engineer, born at Pontarlier, 1733, was originally intended for the church, but on manifesting a decided preference for the study of Vauban, his father, an eminent juriconsult, consented to his choice of a military profession. In 1754, he entered the Military School at Mézières, and, in the following year, he passed as an engineer. During the Seven Years' War, he acquired considerable reputation, especially in the defence of Cassel. His fertility of invention was surprising, and of the greatest benefit to that branch of the service with which he was connected. In all his writings—which, in spite of a very faulty style, can be read with pleasure—there are indications of a lively, rich, and vigorous genius. He was even bold enough to question the wisdom of certain strategical propositions of the Great Frederick. But his most famous scheme was that by which he hoped to reduce Gibraltar, then in the hands of the English, and defended by Governor Elliot. He contrived floating batteries, incombustible, and not liable to sink, which, however, were not successful, though this is mainly to be attributed to the fact of his efforts being indifferently supported. When the French, under Dumouriez, overran Holland, A. took several strongly-fortified places, amongst others, Breda. After this, he retired from public life, and

confined himself to the literature of his profession. His most important work is, *Considérations Militaires et Politiques sur les Fortifications* (Paris, 1795). In 1799, Bonaparte called him to the senate, but he died the year after.

ARCOS DE LA FRONTERA a town on the right bank of the Guadalete, in Andalusia, Spain. Its principal manufacture is that of tanned leather, which was the first established in Andalusia; thread and ropes are also manufactured. Pop. 11,270. A. de la F. has a wild and romantic situation, which harmonises well with the picturesque garb of the inhabitants, who still wear the old national costume. It was called Arcos, from being built in the form of a 'bow;' and after Alfonso-el-Sabio had rescued it from the Moors, it received the additional name of *de la Frontera*, from its frontier position, being in the vicinity of the Moorish kingdom of Granada. Almost impregnable by nature, it was furthermore embattled with walls and towers, part of which still remain, and afford a magnificent view of the Ronda mountains. The rich plains that lie below the rocky town are famed in the Spanish ballads for their breed of war-steeds, 'Arcos barbs.'

ARCOT, a city of Hindustan, in the presidency of Madras, the capital of the division of the same name. It is situated on the right bank of the Palar, a river which, rising in Mysore, is, in the rainy season, about half a mile wide before the town. It stands in N. lat. $12^{\circ} 54'$, and in E. long. $79^{\circ} 24'$, and is distant from Madras 65 miles. Besides the military cantonment, which can accommodate three regiments of cavalry, A. contains some mosques in a tolerable state of repair, and the ruins of the Nawaab's palace. The town and district of A. are stated to contain 10,042 houses, and 53,474 inhabitants.

A. is chiefly noticeable for its history. It was the spot where Clive first firmly established his military reputation. With a force of 300 Sepoys, 200 Europeans, and three field-pieces, he marched against A., which was garrisoned by 1100 men; and after having taken it, he stood a siege of fifty days against thousands of assailants, amid hardships and privations of every description.

ARCOT, a division of the presidency of Madras. It consists of two parts, the northern and the southern, of which the respective areas are 5790 square miles, and 7600, and the respective populations 1,485,873, and 1,006,005.

As most of the rivers are destitute of water in the dry season, there are thousands of tanks in A. Some of them are of an enormous size: that of Cavery-pak, in particular, measures eight miles by three. These tanks are indispensable, as well for irrigation as for domestic use. The hot and parching winds from the west, sweeping down the valleys of the Eastern Ghats, are often fatal to birds on the wing, and also to human beings when exposed for any length of time. Glass cracks and flies in pieces; and wood shrinks, splits, and shivers; and from the mutual friction of the sapless trees, spontaneous combustion sometimes takes place in the jungles.

ARCTIC means, properly, lying near the constellation of the Bear (Gr. *arctos*), and hence, northern. The Arctic Circle is a circle drawn round the north pole, at a distance from it equal to the obliquity of the ecliptic, or $23\frac{1}{2}^{\circ}$. The corresponding circle round the south pole is the *Antarctic Circle*. Within each of these circles there is a period of the year when the sun does not set, and another when he is never seen, this period being longer the nearer to the pole.

ARCTIC HIGHLANDS, a name sometimes applied, though not very appropriately, to that portion

of the American continent which lies between Hudson's Bay and the mouth of the Mackenzie. It has been the scene of all, or nearly all, the overland efforts in connection with the exploration of a North-West Passage, from Hearne's discovery of the Coppermine, down to the recent voyage of Anderson—the most prominent among the intermediate labourers having been Franklin, Richardson, Back, Dease, Simpson, and Rae.

ARCTIC OCEAN, that part of the universal sea which surrounds the north pole. Its single boundary, that towards the south, naturally divides itself into four sections—the northern shores respectively of the two continents, and the northern limits respectively of the two intercontinental oceans.

The A. O. meets the Pacific at Behring Strait, in about 66° of N. lat., so that here the A. O. overlaps the Arctic Circle by about $30'$. On the side of the Atlantic, again, the common border seems to be equally independent of arbitrary definition, for Scoresby Sound almost as definitely terminates the south-east coast of Greenland as North Cape terminates the north-west coast of Europe; so that, as both extremes are intersected by about the same parallel of 71° , the A. O. here falls short of the Arctic Circle by about $4\frac{1}{2}^{\circ}$.

In the Old World, the A. O., if we include its gulfs, stretches south of the Arctic Circle, in the White Sea, fully 2° ; while at Cape Severo, the most northerly point of Asia, in lat. $78^{\circ} 25' N.$, it falls short of the same by $11^{\circ} 55'$. Lastly, within the range of the New World, the A. O., in its strict acceptance, is everywhere forced back within the Arctic Circle, about 5° at Point Barrow, about $7\frac{1}{2}^{\circ}$ on Barrow's Strait, and about 3° at the Strait of the Fury and Hecla.

The waters of the A. O., however, may conveniently be extended beyond these their strict limits. So far as the mere aspect of the map is concerned, Davis's Strait, Baffin's Bay, and Hudson's Bay may be regarded as gulfs rather of the Atlantic than of the A. O. But if essential characteristics are permitted to outweigh mere position, they must be assigned rather to the A. O. than to the Atlantic. Besides being all fed by currents from the A. O., they are all hyperborean in temperature. Even the most southerly of the three illustrates this. While Hudson's Straits present, in general, more ice than Davis's Strait or Baffin's Bay, Hudson's Bay itself has been the scene of perhaps the two most abortive, if not most disastrous, of all modern attempts at northern discovery. On opposite sides of Southampton Island, Lyons and Back were arrested by impenetrable packs, the one near the Bay of God's Mercy, and the other off Cape Comfort—the latter point being $1\frac{1}{2}^{\circ}$ and the former being twice as much, south of the Arctic Circle. Reckoning, therefore, to the bottom of James's Bay, as an arm of Hudson's, the arctic seas, thus appended to the A. O. Proper, reach as far south as the parallel of London.

Little as is yet known, at least accurately, of the A. O., its discovery and exploration have developed and tasked more skill and heroism than perhaps the exploration and discovery of all the rest of the world since the age of Columbus. Without anticipating anything to be said on this subject under the separate heads of North-East Passage, North-West Passage, and Polar Voyages, it may not be out of place here to state summarily the comparatively easy labours of the Russians while issuing, as it were, from their domestic rivers to survey their domestic shores. About a century and a quarter ago, the Muscovites simultaneously sent forth five expeditions to complete, if possible, the North-East Passage. From the White Sea to the Oby, four

seasons were consumed; from the Oby to the Yenissei, four seasons; from the Yenissei to the Lena, season after season was spent in both directions without success: from the Lena to the Kolyma, six seasons were occupied; from the Kolyma to the Pacific every effort was fruitless, though the Cossack Deshneff was known to have accomplished this part of the enterprise about a century before.

Arctic navigation, in fact, is beset by almost every imaginable difficulty and danger. In addition to the peculiar perils of ice in all possible states, the adventurer, often blinded by fogs and snows, has to face, generally without guide or sea-room, the storms, tides, and currents of comparatively unknown waters. If such be his three months of summer, what must be his nine months of winter! Take a general illustration from the personal experience of the most successful of all the arctic navigators. On the parallel of 73° , and under a temperature of 15° below zero of Fahrenheit. Captain McClure spent the night of 30th October 1851 on the ice, amid prowling bears, and that without food or ammunition—his only guide being a pocket-compass, which, however, the darkness, thickened by mist and drift, rendered useless. The gallant officer whiled away the time by sleeping three hours on 'a famous bed of soft dry snow,' and by wandering 10 miles, by the crow's flight, over a surface so rugged as to endanger his limbs. It was at the close of a pedestrian expedition of nine days, on very short allowance of food and water, that the adventure took place; and it had been immediately occasioned by a generous desire of reaching the winter-quarters by a nearer cut, so as to have 'a warm meal ready for his men on their arrival.'

Notwithstanding the labours and researches of two centuries and a half, very little of this vast ocean has been even seen by man. To the north of the $83d$ parallel, in fact, the A. O., so far as authentic evidence goes, is a mere blank to geographers, for Parry, in 1827, barely reached lat. $82^{\circ} 45'$; and Kane, in 1854, touched only $81^{\circ} 22'$, sighting, at the same time, a lofty mountain, which he estimated to be in $82^{\circ} 30'$. Between these extreme points, however, the difference of long. was precisely 85° —Kane having been in $65^{\circ} 35' W.$, and Parry in $19^{\circ} 25' E.$ Along the remaining 275° of long., more than three quadrants of the circumference, the northern limit of geographical knowledge falls short, more or less at every point, of the parallel of 83° . Perhaps the actual average of such northern limit, even on the full tale of 360° of long., may not exceed lat. 75° , so as to leave absolutely unknown a circle of 30° of lat., or nearly 2100 miles in diameter—an area little inferior to that of Europe. This untrodden world, however, is not to be regarded as a continuous wilderness of ice. Parry, at his furthest point, found not an unbroken field, but separate floes, with more or less of open water between them—the mildness of the temperature being indicated by falls of rain; and Kane, again, at his furthest point, saw a free sea to the north, as far as the eye could reach, from a promontory 240 feet high; while, to use his own words, 'a gale from the north-east, of fifty-four hours in duration, brought a heavy swell from that quarter without disclosing any drift or other ice.' This is quite in keeping with the fact already noticed, that Hudson's Straits and Bay are often more encumbered with pack than the waters of far higher latitudes. The only certainty with respect to this central portion of the A. O. is this, that there is from it a current, more or less steady, towards the south. Parry, during nearly the whole of his boat-sleigh expedition of 1827, found that his place by reckoning was considerably ahead of his place by observation, or, in other words, that

his northward progress on the floes was neutralised more or less by the southward progress of the floes themselves. Such a current, though doubtless accelerated or retarded by the direction of the wind, must be deemed a physical necessity, as the only means, in the absence of evaporation, of preventing the perpetual accretions and accumulations of snow and rain. Now, as the Pacific is understood rather to send off than to receive water through Behring Strait, the grand set of the polar currents must be into the Atlantic. Under these conditions, the North-West Passage would appear to have been always more easy of accomplishment from the Pacific to the Atlantic than from the Atlantic to the Pacific; and, accordingly, M'Clure derived advantage from the current, whether advancing through open water or drifting along at the mercy of the pack.

Of the more southerly portion of the A. O., the only section that is tolerably well known to a distance from the continent, is that which washes the north-east of America. It contains, under the collective name of Polar Archipelago, these islands, or parts of islands: Banks Land, Prince Albert Land, Wollaston Land, Victoria Land, Prince Patrick Island, Princess Royal Islands, Melville Island, Cornwallis Island, North Devon, Grinnell Land, North Lincoln, and various others. Off the coast of the Old World, again, are Spitzbergen, Nova Zembla, New Siberia, &c. Of all these the principal will be noticed in their proper places, and shewn in the map of North America, which will be given at the end of Vol. I. The chief straits are Lancaster Sound, Barrow's Strait, Smith's Sound, Regent's Inlet, Strait of the Fury and Hecla, Wellington Channel, Banks Strait, Prince of Wales Strait, &c. The chief Rivers, all of them on the mainland, are the Oby, the Yenissei, and the Lena, of the first class; the Mackenzie, the Yana, the Indigirka, and the Kolyma, of the second; and many others of the third.

The principal production of the A. O. has been the whale. This valuable fish abounds chiefly where the current is strongest—near the respective confluences, as it were, of the A. O. with the Atlantic and the Pacific. The whale-fisheries on the west of Spitzbergen, and on both sides of Greenland, scarcely need to be mentioned further. But it may not be generally known, that, according to official returns as quoted by Admiral Beechey, the Americans had, in two years, drawn more than 8,000,000 of dollars, or upwards of £1,600,000 sterling, from the whale fishery of Behring Strait alone.

On the side of East Siberia, however, the A. O. produces a more remarkable article of traffic. Here are found, in the greatest abundance, the bones of the mammoth. Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, give up, as it were, their dead; while the islands lying off the Yana, and even the depths of the sea itself, literally teem with these mysterious memorials of antiquity.

The American half of the A. O., if it cannot boast of fossil ivory, presents something still more difficult perhaps to be explained. In lat. 74° 25', and lat. 76° 15' respectively, Captain M'Clure and Lieutenant Meham discovered large deposits of trees, apparently indigenous, of considerable size. Writing of Banks' Island M'Clure has the following passages: 'From the summit of these hills, which are 300 feet high, to their base, abundance of wood is to be found, and in many places layers of trees are visible, some protruding 12 or 14 feet, and so firm that several people may jump on them without their breaking: the largest trunk yet found measured 1 foot 7 inches in diameter—equivalent in girth to about 5 feet. Again, 'I entered a ravine some miles inland,

and found the north side of it, for a depth of 40 feet, composed of one mass of wood. Some of it was petrified, the remainder very rotten, and worthless even for burning.' Writing of Prince Patrick Island, Meham has the following passage: 'Discovered buried in the east bank of the ravine, and protruding about 8 feet, a tree of considerable size. During the afternoon I found several others of a similar kind: circumference of first and second tree seen, 3 feet; of another, 2 feet 10 inches. From the perfect state of the bark, and the distance of the trees from the sea, there can be but little doubt that they grew originally in this country. I sawed one through; it appeared very close-grained, and was so immensely heavy that we could carry but little of it away.'

ARCTIUM. See BURDOCK.

ARCTOMYS. See MARMOT.

ARD, or AIRD, a Celtic root, meaning 'height' (compare Lat. *arthus*, high), which appears in many geographical names, especially in Ireland and Scotland.

ARDEA. See HERON.

ARDÈCHE, a department in the south of France, takes its name from the river A., which rises in the Cevennes, flows towards the south-east through a romantic valley, and falls into the Rhone near Pont-St-Esprit. The department of A. lies between Lozère and Drome, with Loire on the north and Gard on the south, and includes the most northern part of ancient Languedoc. Its greatest length from north to south is 74 miles; its greatest breadth, 44. The area of the department is 2133 square miles; the population in 1861, 388,529. A. is almost wholly mountainous. In the north-west of the department, the Cevennes culminate in the volcanic Mont-Mézène, 5972 feet in height. The variety of the numerous extinct volcanic peaks, deep craters, rugged valleys, masses of tufa, grottos, rock-labyrinths, ranges of basaltic columns, gigantic dams, &c., give a most extraordinarily picturesque appearance to the scenery. The upland, which has winter for six or eight months, is devoted to pasturage; but the terraces and valleys near the Rhone enjoy a warm climate, and produce good wine (white and red), olives, figs, almonds, chestnuts, &c. There are manufactures of silk, paper, leather, iron, &c.; and good roads, with water carriage, facilitate commerce. Lead, iron, copper, manganese, &c., are wrought. The chief towns are Privas, Aubenas, Bourg, St Andéol.

ARDEÉ (Ath-air-dee—'Ford on the Dee'), a town in the west of Louth County, Ireland, on the river Dee, twelve miles inland. It contains two ancient castles—one built about the year 1200, and now used as the town house; the other, a square building, and now used as a prison. Pop. 3679. The chief trade is in corn and other agricultural products.

ARDENNES, the western division of the slate-plateau of the Lower Rhine. It extends over portions of Belgium, France, and Rhenish Prussia, and consists of a broken mass of hills, for the most part of no great elevation, which gradually slope towards the plains of Flanders. In early times, the name was given to the whole of the region lying between the Rhine and the Sambre, a length of about 160 miles. The average height of the hills is less than 2000 feet; but in the east, Mont St. Hubert attains an elevation of 2300 feet. Large tracts of this region consist not of hills, but of gently undulating plateaus, which are densely covered with oak and beech forests, while other portions are marshy, heathy, and barren. The districts through which the Meuse and other

rivers flow, present some extraordinary appearances. The channel of the river is sometimes bound in by rugged and precipitous cliffs more than 600 feet high. The principal rocks of the A. are clay-slate, grauwacke, quartz, &c., interspersed with extensive strata of primitive limestone. Coal and iron mines are wrought in the north-west; lead, antimony, and manganese are also found. There is little cultivation of grain, but multitudes of cattle and sheep are reared.

ARDENNES, a frontier department in the north-east of France, bordering upon the provinces of Namur and Luxembourg in Belgium. It formed a part of the old province of Champagne. Length, from north to south, 63 miles; breadth, from east to west, 60; area, 2021 square miles; pop. 329,111. The north-east of A. belongs to the basin of the Meuse; the south-west is watered by the Aisne; both of these rivers are enriched with affluents, and united by the *Canal of A.* About one-eighth, of the whole surface is hilly, and is covered with forests and wide tracts of pasturage. In the north extremity of the department, near Givet, marble is obtained; but the prevailing rock is limestone, veined with lead and iron. South of this, and stretching across the department from east to west, are great layers of slate, with here and there flint, quartz, &c. In the south-east, muschelkalk abounds, which is rich in iron-ore; and in the south-west, the soil is composed of arid chalk, a naked, treeless, elevated plain. Only the valleys are fertile, and produce corn. The vine is nowhere cultivated, except at Mézières, in the south-west. Besides slate, marble, and iron, porcelain-clay and sand for making glass are obtained. Excellent work-horses and valuable sheep are reared. There are manufactures of earthenware, glass, marble, woollen cloths, metallic wares, &c. The principal towns are Mézières, Rethel, Rocroy, Sedan, and Vouziers.

ARDNAMURCHAN POINT, the N. W. promontory of Argyshire, and the extreme western point of the mainland of Britain. A light-house was erected here in 1849, which is visible at a distance of 20 miles. For 10 miles around, the country consists of trap, resting on sandstone often hardened, and blue slates. The trap veins form many striking reticulations in the strata. South of the point are found numerous oolitic and lias fossils.

ARDROCH, a small village in Scotland, county of Perth, 8 miles south-south-west of Crieff, celebrated for a Roman camp, the most entire now in Britain. The camp is 2½ miles north of the Greenloaning Station of the Scottish Central Railway, in the grounds of A. House. The intrenched works form a rectangle 500 by 430 feet, the four sides facing the cardinal points. The north and east sides are protected by five ditches and six ramparts, these works being 270 feet broad on the north side, and 180 feet on the east. A deep morass exists on the south-east, and the perpendicular banks of Knaig Water, rising 50 feet high, protect the camp on the west. The prætorium, or general's quarter, now called Chapel Hill, rises above the level of the camp, but is not exactly in the centre, and is nearly a square of 60 feet each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the prætorium under the bed of the Knaig. Not far north of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist. A mile west of A., an immense cairn of stones lately existed, 182 feet long, 45 feet broad at the base, and 30 feet in sloping height. A human skeleton, 7 feet long, in a stone coffin, was found in it.

ARDROSSAN, a small seaport town and summer bathing-place in Ayrshire. It owes its rise to the public spirit of the Eglintoun family. Its harbor, which is sheltered by an island off the coast, is one of the safest and most accessible on the west coast of Scotland, and has been greatly improved, at vast expense, by the Earls of Eglintoun. There is a large export of coal from this place, and ship-building is carried on to a considerable extent. On a hill above the town stand the ruins of A. Castle, said to have been surprised by Wallace when held by the forces of Edward I. Wallace destroyed the garrison, and threw the dead bodies into a dungeon called 'Wallace's Larder.' Pop. in 1851, 2071.

ARE, the unit of the French land-measure, is a square, the side of which is 10 metres (or 32·809 feet) long (see METRE), and which, therefore, contains 100 square metres = 1076 English square feet. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2·47 English statute or imperial acres.

A'REA (Lat.) is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the ultimate objects of geometry. The measuring unit is a square inch, a square foot, &c., according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure.

ARECA, a genus of Palms, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. Catechu*, the PINANG PALM, or Betel-nut Palm, is a native of the East Indies, whose nut yields a sort of catechu. See CATECHU. This Areca-nut, or Betel-nut, is very much used in all parts of the East, the chewing of it with quicklime and the leaf of the betel-pepper being one of the most prevalent habits of the people. See BETEL. The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form a considerable article of trade in the East. The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 feet high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap.—*A. oleracea*, the CABBAGE PALM of the West Indies, is a very tall tree, 100—200 feet, whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender. The nuts are produced in great numbers; they are about the size of a filbert, and have a sweet kernel.—*A. sapida*, the New Zealand Palm, is remarkable as extending southward beyond the geographical limits of any other of its order, as far indeed as lat. 38° 22' S. It is a small palm, only from 6 to 10 feet high, with leaves 4—6 feet long. The young inflorescence is eaten.—*A. vestiaria*, a native of the East, is so called because clothing is made from its fibres.

AREIOPAGUS (Gr. for 'Mars' Hill'), a mount lying to the west of the Acropolis, at Athens, and celebrated as the spot where the most venerable court of justice in ancient times held its sittings. It is not easy to determine satisfactorily why the hill obtained its name; most probably it was on account

of sacrifices having been offered there at an early period to the God of War; but all its historic importance is derived from the Arciopotagitic Council, the origin of which reaches far back into antiquity, and is ascribed by some to the semi-mythological Cærops. Orestes, according to tradition, was tried before this court, and it is certain that it must have existed long before the first Messenian War (710 B. C.), for the Messenians, in offering to submit to its decisions certain points of dispute, speak of it, even then, as 'old.' Solon, however, made many changes in its constitution, enlarging its sphere of jurisdiction to such an extent that it ceased to be any longer a mere criminal court, and acquired henceforth social and political powers in addition to the former. Before Solon's time, it was strictly oligarchical. It now became a *tertium quid* between aristocracy and democracy, the new qualification for office introduced by Solon being *property* instead of *birth*. It thus naturally allied itself with aristocracy, so that we can perfectly understand why it should have been considered a check upon the impetuous democracy, though it would, perhaps, be fairer to regard it as a check upon both extremes. It is not known how many members were included in its council. The nine archons—if they had recommended themselves by a faithful discharge of their duties—were elected life-members of it. Solon made the council 'overseers of everything,' and we find instances of their manifold authority in the subsequent history of Greece. They granted money, at the time of the Persian invasion, from a reserve treasury of their own, the ordinary public treasury being empty. After the battle of Chæroneia, they executed all who had deserted their country. In social matters, their powers appear to have been curiously minute. They had officers whom they sent or accompanied into private houses, on occasion of a festivity, to see that the rooms were not overcrowded; they called to account persons who lived in such riotous extravagance that their example might be considered hurtful to the community, and conferred marks of honour on those of an opposite character. Their sphere of influence seems to have extended itself to religion also. Innovations in the worship of the gods, neglect of the sacred ceremonies, impiety in any form, brought the offenders under the rebuke and punishment of the A. It is likewise asserted that they possessed and exercised great authority in the education of the young, although this statement, and that regarding some charitable functions attributed to them, are of dubious value.

Until the time of Pericles, the brilliant and powerful ruler of the democracy, the A. continued to maintain its ancient dignity. He soon discovered, however, that it would prove an insurmountable obstacle to the realisation of his designs if not shorn of its privileges. After much and vigorous opposition, he succeeded in carrying a decree (458 B. C.), by which, as Aristotle says, the A. was 'mutilated,' and democratic tribunals acquired supreme authority. It is, however, far from being clear what were the precise changes which Pericles effected, whether he abridged its powers as a criminal, or as a social and political court. From the high estimation in which it was held for centuries after, in the first of these capacities, we are inclined to think that it was its social and political supremacy that was destroyed. Probably the A. was made responsible to the demos, or body of citizens. It lingered in life for a very long period. We hear of it as late as 380 A. D., and it would seem, from the case of St. Paul, that it possessed in his day a certain authority in religious matters.

ARE'NA, a part of an amphitheatre (so called because it was usually strewed with sand, though

when a fit of extravagance seized the Roman emperors, they used borax and cinnabar instead), where the combats of gladiators and wild beasts took place. It had four main entrances, and was surrounded by a wall about 15 feet high, so that the spectators were perfectly safe. The name was afterwards applied by the Romans to any building for exhibitions of baiting animals, horsemanship, &c. On the continent, the name has been given to the large summer theatres for dramatic performances in the open air. It is applied also, in a general sense, to any scene of contest or display of power.

ARENA'CEOUS ROCKS. All rocks composed entirely, or to a large extent, of grains of siliceous, are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally water-worn and rounded. In older deposits, the grains of sand are bound together by silicious, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartz materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of feldspar occur, it is a *feldspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. The presence of lime can always be detected by the effervescence which takes place on the application of muriatic or other acid. When the sandstone is coarse-grained, it is usually called *grit*. If the grains are large enough to be called pebbles, it becomes *conglomerate* or *puddingstone*; if the fragments are sharp and angular, it is called *breccia*.

ARENA'RIA or SANDWORT, a genus of plants of the natural order *Caryophyllææ*, differing from *Stellaria* (Stitchwort, q. v.) chiefly in the undivided petals. The species are numerous, annual and perennial herbaceous plants of humble growth, rarely somewhat shrubby, natives of the temperate and colder parts of the world. Some of them are arctic and alpine plants. Many of them are chiefly found in sandy soils. The flowers are generally small and inconspicuous, but if closely examined, are seen to possess no little beauty. A number of species are natives of Britain.

ARENDAL, a town on the south-east coast of Norway, situated near the mouth of the Nid-elf in the bay of Christiania, with a population of 2200. It is built partly on poles, partly on rock, and this circumstance, as well as its situation, gives it a very romantic aspect. The bay, which is protected by the island of Tromøe, forms an excellent harbour, and favours the commerce of the town, which is considerable, in proportion to its size. A. is intersected by canals; its exports are iron from the neighbouring mines, and wooden articles. Ship-building is also carried on; and on a smaller scale, distilleries and tobacco-factories. King Louis Philippe, after the French Revolution, when wandering in the north as Duke of Orleans, made some stay here.

ARE'NG or ARENGA. See GOMUTO PALM.

ARENI'COLA. See ANNELIDA and SANDWORM.

AREO'METER (*aráios*, thin, and *metreō*, I measure; Fr. *aréomètre* or *pèse-liqueur*; Ger. *Aríometer* or *Senkwaage*), called also Hydrometer, an instrument which is allowed to float freely in liquids, to determine their specific gravity or that of solid bodies. By specific gravity (q. v.) is meant the ratio that the

weight of any volume of a substance bears to the weight of the same volume of water. Thus, a cubic foot of alcohol weighs 793 ounces, while the same quantity of water weighs 1000 ounces; the specific gravity of alcohol is set down, therefore, as $\frac{793}{1000}$, or .793. A cubic foot of sulphuric acid weighs 1841 ounces, and has, consequently, a specific gravity of 1.841. These relations are not confined to the particular volume, one cubic foot, of these bodies, but hold for any equal volumes of them. Equal volumes of alcohol, water, and sulphuric acid, have always to each other the ratio respectively of 793, 1000, and 1841; and this is only an instance of the general principle, that equal volumes of different substances have weights bearing to each other the direct ratio of the specific gravities of these substances. This is the principle on which areometers with weights, or weight-areometers, are constructed. If, however, equal weights of any two of these liquids were taken, it would be found that .793 of a cubic foot of water would weigh as much as 1.000 cubic foot of alcohol; 1.000 cubic foot of sulphuric acid as much as 1.841 cubic feet of water; or .793 of a cubic foot of sulphuric acid as much as 1.841 cubic feet of alcohol: more generally thus—when equal weights of two different fluids are taken, the volumes of each are inversely as their specific gravities. On this latter principle depends the use of areometers with scales, or scale-areometers. The scale-A, is much more commonly employed than the weight-A, and is, in consequence, a much more important instrument. Of the various forms of scale-areometers, that contrived by Gay-Lussac deserves particular notice, from the simplicity of the mode of graduation; and an account of it will give the best idea of the general nature of such instruments. Fig. 1 gives a representation of it. It

ment. Let us suppose, for the sake of simplicity, that the water so displaced is a cubic inch, the weight of the A. will be that of a cubic inch of water, or 250 grains (more correctly 252.5 grains at 60° F.). If the A. be now placed in a fluid heavier than water, such as a mixture of sulphuric acid and water, having a specific gravity $\frac{2}{3}$ or 1.25, it is manifest that if it is sunk again to the water-point, the displaced fluid would weigh $\frac{2}{3}$ of 250 = 812½ grains, or 62½ grains more than the weight of the instrument. As much, therefore, of the stem of the A. must rise above the liquid as will reduce the weight of the displaced liquid to 250 grains, or reduce the volume to $\frac{2}{3}$ of what it was before. If the stem in this case rises to B, the volume displaced by the part WB is $\frac{1}{3}$ of the volume displaced by the instrument at the water-point. If we consider the whole divided into 100 parts, and mark 100 at W, B must be marked 80, as the A. displaces up to that point $\frac{2}{3}$ of 100; and if the intervening space on the stem be divided into 20 equal parts, each of them will correspond with $\frac{1}{100}$ of the water-volume—viz., .01 of a cubic inch, or with $\frac{1}{100}$ of the weight of the instrument—viz., 2.5 grains. If the same scale be carried above the point W, and the divisions marked as ascending from 100, the A. will be serviceable likewise for fluids less dense than water, and will mark the volumes which it displaces in each of them. The A. thus graduated gives immediately the volumes which it displaces in different liquids; and from these, seeing that it displaces in every case a weight of liquid equal to its own, the specific gravities may be calculated according to the principle already stated—viz., that equal weights of two different fluids have volumes inversely as their specific gravities. If, in a mixture of sulphuric acid and water, the A. stands at 90, according to the above principle, 90 volumes of the mixture weigh as much as 100 of water; therefore, its specific gravity is $\frac{100}{90}$, or $1\frac{1}{9}$. If, again, in a mixture of spirits and water, it should stand at 110, 110 volumes of the mixture weigh as much as 100 of water, so that its specific gravity is $\frac{100}{110}$, or $\frac{10}{11}$. In all cases, then, 100 is to be divided by the number read on the A., to determine the specific gravity of the liquid in which it floats.

The delicacy of the A. depends on the distance of the divisions on the scale, or on the thinness of the stem compared with the bulbs. An instrument possessing this advantage cannot be made to serve both for liquids heavier and lighter than water, for the stem would be of an inconvenient length; and it is usual to construct two areometers—one marked with the water-point at the top, and the scale descending to 50, for fluids heavier than water; and the other, with the water-point at the bottom, and the scale ascending to 150, for fluids lighter than water. The scale is generally marked on a slip of paper, which is fixed inside the stem. Gay-Lussac's A. is also known under the name of 'volumometer.' Although it cannot be surpassed either for accuracy or simplicity, it is much less used than other instruments of a similar nature furnished with arbitrary scales, requiring the aid of tables to interpret the readings. The best known of these is Twaddle's A., used in England; and Beaumé's A., extensively adopted on the continent. The A. with an equally divided scale is a very ancient instrument; it was known among the Greeks under the name of "baryllion." On some areometers the divisions are not at equal distances, but are so drawn as to give at once, without table or calculation, the specific gravity of the fluid in which they are placed. Although very desirable, in practice they do not possess the accuracy of the A.

Areometers.

consists of a uniform glass tube, AB, blown into two bulbs, C and D, at the bottom. The lower bulb, D, is loaded with mercury, so that when the instrument floats in any liquid, the stem, AB, is maintained in a vertical position. We shall suppose that the quantity of mercury is so adjusted that when placed in water, the A. sinks to the point W, which may, in consequence, be called the water-point. According to the principle of Archimedes, the weight of the volume of water displaced by the instrument up to this point is equal to the weight of the instru-

with equally divided scales, because the graduation of them is attended with considerable difficulty.

No form of A. can be made to determine specific gravities with perfect accuracy, and such instruments are only useful where a ready and good approximation is all that is needed. They are, in consequence, employed chiefly to ascertain the specific gravity of the various liquors and solutions which occur in the arts and manufactures, and very frequently they are graduated with reference to special liquids, as spirits, wine, milk, brine, &c. The Alcoholometer or Hydrometer of Sikes is an instrument of this latter description, and is in general use in the Excise for estimating the strength of spirits. It is represented in fig. 2. BC is a hollow brass ball, surmounted by a flat stem AB, and loaded below by a short conical stem CD, terminated by the pear-shaped bulb D. It is accompanied by eight weights, by which the weight of the instrument may be increased, and the range of the scale extended to fluids heavier as well as lighter than water. One of these weights, W, is shewn in the figure; it is furnished with a slit, so as to allow of it being slipped on to the narrowest part, C, of the lower stem. The stem, AB, is graduated into 11 equal parts, and these again into halves; and the instrument is so adjusted that its indications give the volumes of water that must be added to or taken from 100 volumes of the mixture under examination to reduce it to proof-spirit (see ALCOHOL), which is a mixture of nearly equal parts of water and alcohol. Thus, if the A. indicates 11 over-proof, 11 volumes of water must be added in order to bring the liquid down to proof-strength; and 100 gallons of such strength would be reckoned as 111; 100 gallons, at 11 under-proof, would in the same way be charged as 89. Very carefully constructed tables accompany the instrument, in which the specific gravity and percentage of alcohol of different mixtures, at different temperatures, are marked, corresponding to each degree of the A. Since the specific gravity of alcohol is known, it might be thought, that if that of a mixture of it with water were known, the relative proportions of each would also be known. Such, however, is not the case, for alcohol and water possess a chemical affinity for each other, which causes the combined volumes of the two to measure less than the two volumes separately. Thus, 50 volumes of alcohol mixed with 50 volumes of water does not make 100 volumes of the mixture, but only 96, and thereby the specific gravity of the mixture is higher than it would have been if no contraction had taken place. As the law of this contraction is very complicated, the relative proportions of the two in a combination of given specific gravity, are only to be estimated from tables founded upon experimental data.

The peculiar feature of areometers with weights is, that instead of a scale they have only one mark on the stem, to which the A. is in all cases sunk. One of the best known instruments of this kind is the A. of Nicholson. It consists of a brass tube, BC (fig. 3), about 1 inch in diameter, closed above and below by conical ends, to the upper of which a wire is fixed, carrying on the top of it a cup A, capable of containing the weights; and to the lower, a hook is attached, from which hangs the cup D. The lower part of the cup, D, is also provided with a hook, and the whole instrument is kept vertical, partly by the weight of the cup, and partly by the weight of the ball, E, suspended from it. On the wire, a notch, W, is made, to serve as the mark or fixed point to which the A. is sunk. The specific gravities of liquids are determined by Nicholson's A. in the following way: The weight of the A. itself is first ascertained—let it be in a given case 2000 grains

—it is then put into water at the temperature 60° F., and weights (say 500 grains) put in, till it is sunk to W. It is now removed to the liquid under examination; and if the weight required to sink the instrument now to the standard point be only 100 grains, we have the specific gravity of the liquid equal to $\frac{2100}{2500}$, or $\frac{21}{25}$. In both fluids, the same volume has been displaced, and that is in each case equal to the weight of the A.; but the weight of the A. in the second case was $2000+100$, and in the former, $2000+500$; hence the above result. Nicholson's A. is seldom used for finding the specific gravity of fluids; its use is almost entirely restricted to ascertaining that of small solid substances, as gems and small pieces of minerals. The following example will show how this is done: If in the cup of the A. already mentioned, when placed in water, the gem be put, and only 440 grains be then necessary to bring the instrument to W, 60 grains is manifestly the weight of the gem, because 500 grains were needed without it to do the same thing. The gem is next placed in the lower cup, D, and if 460 grains are now needed to sink to the standard point, the gem has thus lost 20 grains of its weight by being immersed in the water. According to the principles of Archimedes (q. v.), these 20 grains are also the weight of a volume of water equal to that of the gem; so the specific gravity of the gem is $\frac{60}{20}$, or 3. By reversing the cup D, which is furnished with perforations, to allow free passage to the air, and attaching the weight, E, to the handle of it, the specific gravity of substances lighter than water may also be determined by this instrument. The other forms of weight-areometers are those of Fahrenheit, Tralles, and Charles. For the more accurate determination of the specific gravities of liquids and solids, see SPECIFIC GRAVITY.

AREQUIPA, a term primarily applied to a mountain in the west Cordillera of the Peruvian Andes, and secondarily to a city at its foot, being from this, again, extended to a district, a province, a department, and a diocese. 1. The city, which is in lat. $16^{\circ} 13' S.$, and in long. $76^{\circ} 18' W.$, is the third largest in Peru, being inferior only to Lima and Cuzco, and is said to contain 30,000 inhabitants. It carries on a considerable trade both with the interior and by sea. Its port is Islay, one of the larger harbors of the republic. 2. The department is bounded N. by Lima; E. by Ayacucho, Cuzco, and Puno; S. by Moquega, which, along with it, forms the diocese; and W. by the Pacific. It contains 137,509 inhabitants, and is subdivided into seven provinces. Like nearly the whole of the maritime region of Peru, it is generally arid and sterile. 3. The mountain is volcanic, of the form of a truncated cone, and of the height of 20,320 feet. Its neighbourhood is subject to earthquakes.

ARÉS. See MARS.

ARETÆUS, a famous physician of Cappadocia, who flourished in the latter half of the 1st, and in the beginning of the 2d century after Christ. He is considered to rank next to Hippocrates in the skill with which he treated diseases; but he did not, in every instance, follow the practice of the "Father of Medicine." He was less attentive to "the natural actions" of the system, which he frequently counteracted, if he thought it desirable; administered active purgatives copiously, employed narcotics, and did not object to bleeding. He was, in fact, noted for his total want of professional bigotry; and hence, not committing himself to any particular set of opinions, in his accuracy in the detail of symptoms and the diagnosis of disease, he is superior to most of the ancient physicians. His great work, written in

singularly elegant and concise Ionic Greek, is divided into two parts. The first four books treat of the causes and symptoms of acute and chronic diseases; the second, the cure of the same. They are almost in a state of complete preservation, and have been translated into various European languages, besides having been frequently edited in the original. The finest edition is the Oxford one of 1723, by J. Wigan; a German translation appeared at Vienna (1790—1802), and an English by T. F. Reynolds, Lond. 1837.

ARETHUSA. See ALPHEIUS.

ARETINIAN SYLLABLES are the syllables *ut, re, mi, fa, sol, la*, used by Guido d'Arezzo for his system of hexachords.

ARETINO, PIE'RO, an Italian author of the 16th c., was the natural son of a gentleman named Luigi Bacci, and was born at Arezzo, in Tuscany, on the 20th of March 1492. Banished from his native town, he went to Perugia, where he wrought as a bookbinder, and gathered up a few scraps of learning, until, seized with a desire of becoming famous, he abandoned his occupation, and wandered through Italy in the service of various noblemen. At Rome, he distinguished himself by his wit, impudence, and talents, and secured even the papal patronage, which, however, he subsequently lost by writing licentious sonnets. A. now went to the Medicean court, where John de' Medici grew so fond of him that he shared his bed with the adventurer, and even procured him an opportunity of ingratiating himself with Francis I. at Milan in 1524. A few years later, he settled at Venice, where he also acquired powerful friends. The Bishop of Vicenza not only soothed the irritation of the pope against A., but also recommended him to the Emperor Charles V. The latter, as well as his chivalrous rival, Francis, and other great persons, pensioned the fortunate wit, besides enriching him with splendid presents. He likewise obtained considerable sums for his literary efforts.

Nature had undoubtedly gifted A. with some fine qualities, but these were vitiated by his love of sensual gratifications. His death in 1556 accorded with the character of his life. It is said that while laughing heartily at some trifling adventure of one of his abandoned sisters, he fell from a stool, and was killed on the spot. His poetical works include five comedies and a tragedy. The former are full of wit and genuine comic humour; the latter is not without merit. His *Sonetti Lussuriosi* have been translated into French under the title of *Académie des Dames*. Besides these, he wrote a number of other pieces, some of which have not been published. His satire procured for him the name of 'the Scourge of Princes;' but it seems clear that he was equally well fitted to be their sycophant. Although the very impersonation of licentiousness, he had nevertheless the impudence to publish some books of a devotional kind, with the view of obtaining the favour of the pope.

ARETINO, SPINELLO, an early Italian painter of great genius, was born at Arezzo in 1316, or, according to others, in 1328. He studied under Jacopo del Casentino; but before he had attained his majority, he had surpassed his master in the vigour and liveliness both of his conceptions and colouring. His reputation attained its full bloom after he went to Florence, where he painted in Fresco, in the chapel of St. Maria Maggiore, several incidents in the life of the Virgin and of St. Antonio Abate. The monastery of San Miniato, near Florence, contains to the present day a few of his frescoes. He also adorned the monasteries of San Bernardo at Arezzo, and Monte Oliveto near Florence. Vasari thought that the finest works of A. were those which he

executed for the Campo Santo at Pisa, illustrating the life of San Ranieri. Of these, however, we have only prints, and cannot therefore judge satisfactorily. His principal works, still remaining, are those from the life of Pope Alexander III. in the town-hall of Siena. He died in 1408.

Throughout all Italy, A. was greatly admired for his invention, the grace and simplicity with which he arranged his figures, and the finish of his style. His Madonnas possessed a remarkable sweetness of expression; and his colouring was in most cases bold and beautiful. Vasari prefers him to Giotto.

AREZZO (ARETIUM), the chief city of the Tuscan province of A., is situated in a fertile valley near the confluence of the Chiana with the Arno, lat. 43° 27' N., long. 11° 52' E. It is 38 miles E.S.E. from Florence. A. is perhaps the oldest town in Tuscany, and formed one of the twelve cities of the ancient Etruscans. It was devastated by Sylla during the Social War; and, like many other Italian cities, was sacked by the Goths when they burst into the peninsula. During the contest of the Guelphs and Ghibellines, in a later age, it became subject to Florence, whose troops defeated those of A. at the battle of Camaldino, in which the poet Dante took part. Arezzo contains 10,000 inhabitants; but its extensive walls and numerous churches bear record of its more flourishing period, when it had 30,000. The *Piazza Grande*, the *Pieve*, an old church founded on the site of a heathen temple, and the cathedral, which, like almost all the other churches, has an unfinished façade, are the principal public buildings. The cathedral has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the old Tuscan school of painting. These ecclesiastical decorations are contrasted with the general aspect of the city, which has dark and dirty streets. Its industry is at present at a very low ebb, there being few or no manufactures, and its people are not generally favourites in Italy; but perhaps no city of its size ever produced a greater number of celebrated men, among whom may be mentioned—Mæcenas, the famous patron of letters in the time of the Emperor Augustus; Petrarch; Pietro Aretino; Guido de A., inventor of the gamut; Leonardo de A., the historian; Cesalpino, the botanist; Redi, the physician; Pope Julius III.; the notorious Marshal d'Ancre; and Vasari, author of *Lives of the Painters*. Michael Angelo was also born in the vicinity of A. The province of A. contains 1268 square miles, with a pop. (1864) of 222,654. The soil is fertile in corn, wine, and oil.

A'RGALA. See ADJUTANT.

A'RGALI (*Ovis Ammon*), the great wild sheep of Siberia and Central Asia. It is found from Kamtchatka to the Himalaya Mountains, where, however, it is only seen in the more elevated regions. 'We

Argali.

came suddenly,' says Dr. Hooker in his *Himalayan Journal*, 'upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were twenty-five of these enormous animals, of whose dimensions the term sheep gives no idea; they are

very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet.' The horns of the male are nearly 4 feet long, and 14 inches in circumference at the base, where they are triangular. The general colour is fulvous gray, white beneath, with a whitish disk around the tail. The wool is concealed by hair. The name *A.* is Mongolian, and was adopted by Pallas. A similar but smaller species is also found on the Himalaya Mountains. The Rocky Mountain Sheep, or Big-horn, is sometimes called the American *A.* See SHEEP.

ARGAN (*Argania sideroxyylon*, *Sydneyoxylon spinosum* of Linnaeus), a low spiny evergreen tree of the natural order *Sapotaceae*, a native of the southern parts of the kingdom of Morocco, bearing an ovate drupe about the size of a plum, dotted with white, and full of a white milky juice. The Moors extract an oil from the fruit, which they use with their food.

ARGAND, AIMÉ, physician and chemist, was born at Geneva about the middle of the 18th c. He was the inventor of the well-known *Argand lamp*. The chief difficulties that attended the use of lamps as a source of light were—first, in procuring the complete combustion of the oil, so as to keep the flame from smoking; and second, in preventing the level of the oil in the reservoir from sinking as the combustion goes on. The round cotton-wick, used in the old simple form of lamp, was always attended with smoke and smell. The oils and fats are exceedingly rich in carbon, containing 70 to 80 per cent. of that element, and only 10 to 12 of hydrogen. The round thick column, then, of oil-vapour rising from the wick of an old-fashioned lamp, presented too little extent of surface to the air; the oxygen of all the air that could get access was chiefly taken

up in burning the hydrogen, and a large proportion of the carbon ascended in the burnt air as smoke. A's improvement was that he made the wick in the form of a ring. The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the

Argand Burner.

lamp did not satisfy the expectations of A., till his younger brother accidentally discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded.

A. was soon involved in a dispute with one Langé of Paris regarding the originality of his invention. He went thither to vindicate his claim, but rather than risk the chances of a lawsuit, he consented to share the honour, and a patent was obtained by which Langé and A. alone were authorised to make and sell the new lamps in France for 15 years. The French Revolution, however, destroyed their privilege, and A. retired to England. After some time, he returned to his native country, a victim to melancholy and fantastic humours, and died on the 24th October 1863.

ARGAUM, a village in the territory of the Nizam. It is in lat. 21° 2' N., and in long. 77° 2' E., on the route between Ellichpore and Aurungabad. Its single claim to notice is that, on 28th November 1803, about two months after the battle of Assaye, Major-general Wellesley here gained another victory over the Mahrattas. To commemorate this action, a medal was struck in 1851, about a year before the death of the illustrious conqueror.

ARGEL, or **ARGHEL** (*Solenostemma A.*, or *Cynanchum A.*), a plant of the natural order *Asclepiadaceae*, a native of Arabia and of the north of Africa, deserving of notice only because of the frequent use of its leaves for the adulteration of senna. They are lanceolate and leathery, and may readily be distinguished from genuine senna leaves by their texture, their being downy, their great heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna-leaves being unequal. They are acrid, and cause sickness and griping, but a difference of opinion subsists as to their possessing purgative properties.

ARGLANDER, FRIEDRICH WILHELM AUGUST, one of the most eminent astronomers of our time, was born, March 22, 1799, at Memel. He studied at Königsberg, where the science of finance first attracted him; but he was subsequently drawn away to that of astronomy by the lectures of Bessel, by whom he was employed to make calculations and observations. In 1820, he was appointed assistant to Bessel in the Königsberg Observatory, and in 1823 succeeded Walbeck as astronomer at the observatory of Abo, in Finland. Here he commenced a series of observations on the fixed stars which have a perceptible 'proper motion.' His studies were unfortunately interrupted by a fire which destroyed the observatory; but after a time, he resumed them in a new observatory at Helsingfors, and published a catalogue of not less than 560 stars having 'proper motions.' This contained the results of his observations at Abo, and received from the Academy of St. Petersburg the great Demidov prize. After removing to the university of Bonn in 1837, A. published his *Uranometria Nova* (Berlin, 1843), containing celestial charts of the fixed stars seen in our hemisphere with the naked eye; also (in 1846) his *Astronomical Observations*, containing the results of an examination of the northern heavens from 45° to 80° declination, and giving the positions of 22,000 stars. For a considerable number of years, A. has been engaged in a series of observations on the changes of light in variable stars. He has also demonstrated the theory that the solar system has a progressive motion in space.

ARGE-MONÉ, a genus of plants of the natural order *Papaveraceae*, distinguished by 4—6 petals, 4—7 radiating concave stigmas, and an obovate capsule, opening by valves at the point. *A. Mexicana*, sometimes called Mexican Poppy, is an annual herbaceous plant with large yellow flowers, and sessile, wavy and sinuated, spiny leaves, variegated with white. It is a native of Mexico and of the southern parts of the United States, and is now also common in many tropical and sub-tropical countries, in which it has been naturalised. Its seeds are narcotic, purgative, and diuretic, exhibiting in a strong degree those qualities of the order of which the seeds of the poppy are devoid. They are used in the West Indies as a substitute for ipecacuanha, also instead of opium; and the juice of the plant is employed as a remedy for ophthalmia.—This plant is not unfrequently to be seen in flower-borders in Britain; but in the northern parts, at least, the seed is generally sown in a hot-bed.

ARGENS, JEAN BAPTISTE DE BOYER, MARQUIS D', born at Aix, in Provence, June 24, 1704. He was originally intended for a learned career; but, from a love of adventure, he entered the army at fifteen. Fascinated by a certain actress, he eloped with her to Spain, but was captured, and brought back to Provence. In spite of his glaring breach of discipline, he had the good fortune to be employed in the French embassy to Constantinople, and on his return, re-entered the army. Being disabled by

accidents in military service, and disinherited by his father, he tried his fortune in authorship, and by his *Lettres Juives*, *Lettres Chinoises*, *Lettres Cabalistiques*, and *La Philosophie du Bon Sens* (London, 1737), attracted the notice of Frederick II., then Crown-prince of Prussia, and became a favourite at the court of Prussia when Frederick came to the throne. The king appointed him chamberlain, and a director of the Art Academy at Berlin, with a salary of 6000 livres. He was a constant associate of Frederick, who liked exceedingly his frank and vivacious character, but used to tease him on account of his hypochondriacal fits. When almost a sexagenarian, he renewed the adventures of his youth by again falling a victim to the charms of an actress, Mademoiselle Cochois, whom he married without Frederick's permission. This and other circumstances irritated the despotic monarch, who deprived A. of his pension. The latter now returned to Provence, and died at Toulon, January 11, 1771. His numerous writings, but especially his *Histoire de l'Esprit Humain*, *Lettres et Mémoires*, and those above mentioned, once enjoyed a considerable reputation.

ARGE'NSOLA, LUPERCIO and BARTOLOMÉ LEONARDO DE, two of the first among the Spanish poets in the 'golden age,' were born at Barbastro, in Aragon; the former in 1565, the latter in 1566. They studied at the university of Huesca. Lupercio afterwards went to Madrid, while Bartolomé entered the church. In character and fortune, however, they were closely united throughout the whole of their career. Both were patronised by Maria of Austria, who appointed the one her chaplain, and the other her private secretary. The latter was subsequently made chamberlain to the Archduke Albert of Austria, and Philip III. appointed him historiographer of Aragon. Bartolomé was employed by the Count de Lemos to edit the *Conquista de las Molucas* (Madrid, 1609); and when this nobleman was appointed as viceroy of Naples, both the brothers A., who had acquired fame as poets, attended his court at Naples, where Lupercio, who then filled the office of Secretary of State, died in 1613. Bartolomé returned to Spain with the viceroy in 1616, and occupied the position formerly held by his brother, as historiographer of the kingdom of Aragon, where he proceeded with the work left unfinished by Lupercio—a continuation of Zurita's *Annals of Aragon*. While engaged in this work, he died, February 26, 1631. The collected poems of the two brothers were first published in 1634, by the son of Lupercio, and passed through several editions. These poems (*Rimas*) consist of epistles, odes, sonnets, and satires, and are singularly alike in character. They are imitative of the style of the Latin poets (especially Horace, for which reason the brothers have been styled 'the Spanish Horaces'), and display more care and polish than originality of invention or richness of fancy. Bartolomé A., as a prose-writer, is reckoned among the Spanish classics. The style of his continuation of Zurita is a great advance on the original, especially in correctness.

ARGENSON, MARC PIERRE, COMTE D', a celebrated French statesman, was born in 1696. After holding a number of inferior offices, he succeeded M. de Bretueil as Secretary of State to the war minister in 1742. On the death of Cardinal Fleury, in the following year, the whole care of the war then raging devolved upon him. He found matters in the most deplorable condition. The French troops, decimated by sword and disease, were in full retreat across the Rhine; the Austrians already swarmed in Alsace and Lorraine,

and the very political existence of France was imperilled; but the vigorous efforts of A., and his singularly lucky choice of generals, completely changed the fortunes of the war in the course of one year. The theatre of strife was transferred to the Low Countries; and after the victories of Fontenoy and Lawfeldt, the capture of Bergen-op-Zoom, and the investment of Maestricht, peace was secured by the famous treaty of Aix-la-chapelle, signed in 1748. A., however, did not remain inactive. He built new fortresses and repaired old ones, established the *Ecole Militaire* in 1751, and, by various measures, sought to keep alive the military ardour and spirit of the nation. He was likewise an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great *Encyclopédie*. He was the friend of Voltaire, whose fellow-student he had been, and furnished him with materials for his *Siecle de Louis XIV.* On the breaking out of the war again in 1756, his valuable services were neglected, and next year he was deprived of the office, and exiled to his estate of Ormes, where he spent six dreary years. It is supposed that this calamity befell him through the machinations of Madame Pompadour, his worst enemy. On her decease, he returned to Paris, where he died in 1764.

ARGENT, the French word for silver, is always used in English heraldry to signify that metal. In engraving shields, it is left white.

ARGENTEUS CODEX. See ULFILAS.

ARGENTINE (*Argentina*), a genus of small fishes of the family *Salmonide*, of which one is rarely found on the British shores, and two or three are found in the Mediterranean. They are chiefly remarkable for the resplendent silvery lustre of their sides, and the abundance of *nacre*, the substance used in making artificial pearls, with which their air-bladder is externally loaded. It consists of a coat of silvery fibres. Upon account of it, they are sought after. They are commonly taken in nets along with anchovies or sardines.

ARGENTINE REPUBLIC, the confederation of the Rio de La Plata, or River of Silver, South America—the Latinised epithet and the Spanish term being merely copy and original of one and the same misnomer. This confederation may be described, accurately enough for the present purpose, as extending in S. lat. between 22° and 41°, and W. long. between 57° and 70°. In addition, however, to the thirteen confederated provinces themselves, these limits comprise Buenos Ayres, which, separated in 1853, was re-united to the republic in 1859. Including Buenos Ayres, the whole country, constituting nearly a rectangle of 19° of lat. by 13° of long., may be estimated to contain rather less than 1,100,000 square miles; so that, after deducting 200,000 as the computed area of Buenos Ayres alone, there will remain for the thirteen provinces about 900,000 square miles—a sum-total of which falls somewhat short of the generally received aggregate. This vast surface, 7½ times the extent of the British Isles, contains only 874,000 inhabitants, being not quite an inhabitant to a square mile. This population is said to be thus distributed among the fourteen provinces:

Province.	Capital.	Population.
Cordova, . . .	Cordova, . . .	140,000
Catamarca, . .	Catamarca, . .	97,000
Corrientes, . .	Concepcion, . .	85,000
Entre Rios, . .	Parana, . . .	107,000
Jujuy, . . .	Jujuy, . . .	40,000
Salta, . . .	Salta, . . .	80,000
Mendoza, . . .	Mendoza, . . .	58,000
Rioja, . . .	Rioja, . . .	40,000
		387

Province.	Capital.	Population.
San Jago del Estero,	San Jago,	90,000
San Juan, ...	San Juan,	70,000
Santa Fe, ...	Santa Fe,	45,000
San Luis, ...	San Luis,	58,000
Tucuman, ...	Tucuman,	100,000
Buenos Ayres, . . .	B. Ayres,	450,000

The A. R., as a whole, is bounded on the W. by Chili, on the N. by Bolivia, on the E. by Paraguay, Brazil, Uruguay or Banda Oriental, and Atlantic Ocean, and S. by Patagonia, on about the 40th parallel. Excepting the almost purely Indian districts to the west of Buenos Ayres, it lies chiefly in the basin of the Rio de La Plata, embracing much the larger half of the same. Mountains abound in the north-west; and elevated ranges are found also in Entre Rios, which is situated, as its name implies, between the Parana and the Uruguay. But, with these exceptions, nearly the whole country presents boundless plains, covered alternately with rich pasturage and gigantic thistles. The climate and productions vary considerably—being tropical and temperate respectively to the north and south of Corrientes (in 27° 27' N. lat.). Agriculture, however, of every description is very backward—less, perhaps, than $\frac{1}{1000}$ of the surface being under cultivation. The rearing, in fact, of live-stock is the grand business of the country. Millions of cattle wander at will across the plains, or are kept on breeding-estates of vast extent; and likewise of mules and horses there are immense bands. Besides the Rio de La Plata, which is rather an estuary than a river, and its far-reaching affluents, the hydrography of the A. R. comprises the head-waters of some southern streams, which fall into the open Atlantic, such as the Rio Colorado, the Rio Negro, &c.; and along the west border, under the shadow, as it were, of the Andes, salt-lakes are common. In connection, doubtless, with this feature in the hydrography, mines of rock-salt exist, and salt here and there abundantly encrusts the plains, both to the satisfaction and benefit of the roaming herds. The names of the country and its estuary, as indicating the presence of silver, have been already characterised as misnomers; and though mines of other minerals—such as sulphur and alum—are found in the neighbourhood of the Andes, yet few, if any, of them are wrought.

In 1515, Juan Diaz da Solis, while searching for a passage into the Great South Sea newly seen by Balboa, entered the Rio de La Plata. In 1526, Sebastian Cabot, son of the discoverer of Newfoundland, penetrated nearly to the confluence of the Parana and the Paraguay, being arrested by the rapids, which afterwards gave name to Corrientes. In 1535, Buenos Ayres was founded, to command, though indirectly, the most practicable channel of the only outlet of the country, a city which, in conjunction with its own colony of Monte Video, on the opposite bank, has virtually monopolised the history of a region equal in extent to Western Europe. Gradually other cities were planted, partly by colonists from Spain, and partly by adventurers from Peru, generally giving each its own name to its own province; and the grand staples of the country—horses and cattle—had been largely introduced before 1552. Down to 1775, the basin of the Rio de La Plata was a dependency of the viceroyalty of Lima. In that year, however, was erected the viceroyalty of Buenos Ayres, which, to the basin in question, added Bolivia, under the name of Upper Peru, thus embracing the head-waters of the Amazon, and also most of the plateau of Titicaca. The year 1806 ushered in a new order

of things. Spain, as an ally of France, being then at war with England, both Buenos Ayres and Monte Video were occupied by the English—a change which, brief as was its duration, virtually sowed the seeds of revolution. The colonists had felt the inconvenience of belonging to a state which left them, in a great measure, to defend themselves; they had successfully tried their strength against a foe more powerful than their own masters; and they had been encouraged not less by the sayings, than by the doings, of their invaders to assert their independence. These influences were, in fact, instantaneously exemplified. The triumphant militia, after deposing and expelling the legitimate viceroy for cowardice, elected in his stead the French officer who had led them to victory. Thus had the viceroyalty of Buenos Ayres become peculiarly ripe for taking its share in the outbreak, which Napoleon's dethronement of the Bourbons, in the spring of 1808, almost immediately occasioned throughout Spanish America. Neither the revolutionary struggles, nor the intestine broils that have been almost without interruption, are entitled to special notice in this article, inasmuch as they will more naturally fall under the heads of such sections of the viceroyalty as no longer form part of the A. R., Bolivia, and Uruguay or Banda Oriental.

Two general remarks, however, on the subject may not be out of place. The struggles of independence, at least within the purely Argentine provinces of the viceroyalty, terminated in 1816—sooner than in any other division of Spanish America. Again, the intestine broils, beyond the example even of Spanish republics, have been aggravated by peculiar elements of discord. The population, consisting chiefly of hunters and herdsmen of mixed race, is always as ready for rapine and bloodshed as it is indifferent to law and order; the boundless interior has a standing feud with the narrow sea-board, which shuts it out from the ocean; the Banda Oriental has been a bone of contention between the Brazilians and the Argentines; while England and France, with a view to the freedom of commerce, have thrown their weight in favour of its separate and independent existence. But beyond, perhaps, all these grounds of strife, have been the mutual jealousies of Buenos Ayres and Monte Video. While the latter enjoys easier access to the Atlantic, the former has long commanded a more practicable channel to the vast country behind and above. Recently, however, Buenos Ayres seems to have lost something of its superiority through the explorations of the Americans. The following passage is from the pen of Lieutenant Page of the *Waterwitch*: 'We have discovered also a new channel between the island Martin Garcia and the Banda Oriental of two feet more water than the old channel contains. The importance attached to this discovery is not confined to the greater depth of water in the new channel, but it assumes a political character. Instead of Buenos Ayres possessing, as she now claims, exclusive jurisdiction over the entrance of the rivers Parana and Uruguay, she has, over the new channel, only concurrent jurisdiction with the Banda Oriental. The new channel is more easily entered, and in it vessels are not obliged to pass nearer to Martin Garcia than $1\frac{1}{4}$ mile.

ARGES, a genus of small fishes, of the family *Siluridae*, of extreme interest on account of their being frequently thrown out in vast numbers by some of the South American volcanoes, with torrents of muddy water. Humboldt was the first accurately to inquire into this wonderful fact, and to describe one of these fishes, which he referred

to the genus *Pimelodes*, and called *P. cyclopum*. It is now called *A. cyclopum*. The quantities of these fishes ejected from the volcanoes in the neighbourhood of Quito is sometimes so great, that the stench of their putrefaction is felt at a great distance, and putrid fevers are caused by it. They are expelled from craters or from lateral openings at an elevation of 16,000 or 17,000 feet above the sea. It is supposed that they exist in lakes within the cavernous recesses of the mountains, but nothing is positively known on this subject. Their capacity of enduring the high temperature of the water with which they are ejected, has excited much interest. Several species are known, to which the common name of *pruñadillas* is given in the country, and which are placed by ichthyologists in the genus *A.*, and the closely allied genera *Brontes* and *Astroblepus*.

ARGIL, clay or white clay, a term now little used, but of which the derivative *argillaceous* is still in frequent use as descriptive of soils, geological deposits, &c., and in the name *Argillaceous Slate* or *Argillaceous Schist*, instead of which, however, the name *Clay-Slate* (q. v.) is more generally employed. The term *argillaceous* is rather vague, and sometimes *clayey*, sometimes *aluminous*, would seem to be its equivalent. See ARGILLACEOUS ROCKS.

ARGILE PLASTIQUE, a series of beds at the base of the Tertiary system in France, resting on a conglomerate or breccia of rolled and angular chalk-flints. They consist of extensive deposits of sand, with occasional beds of plastic clays, used for pottery. Marls occur, enclosing, in some places, the fluviatile shells that are met with in the same position in the London basin, and in others, large numbers of a species of oyster. Beds of impure lignite also occur.—The A. P. is the equivalent in the Paris basin of the Woolwich and Reading series, or Lower Eocene of the English geologists. See EOCENE.

ARGILLACEOUS ROCKS. All rocks composed entirely or to some extent of clay are included under this title. Pure clay is known as *kaolin* or *porcelain clay*. It is a hydrated silicate of alumina. Decomposed felspar, from which the silicates of potash, soda, &c., have been washed out, supplies the material which forms kaolin. *Common clay*, however, contains many impurities; the chief are sand, in variable proportions, and oxide of iron, which gives its colour to the mass. Any matter that contains sufficient alumina (more than 10 per cent.) to enable it to retain its shape when moulded and pressed, is called clay. Plastic clays occur abundantly in the superficial deposits and in the Tertiary strata. The older clays become more or less indurated. When they are regularly laminated, and split into thin layers in the direction of the laminae, they are called *shale*. In *clay-slate*, the clay has become highly indurated and metamorphosed, so as to split into plates that are altogether independent of the original lamination, and frequently cross it at right angles. Clay-slate forms extensive deposits in the Azoic rocks, but it is not confined to these, for the Palæozoic shales are often converted into clay-slate, when, from their proximity to crystalline rocks, or other cause, they have been subjected to the action of heat.

A. R. can generally be distinguished by the peculiar 'argillaceous' odour which they give out when breathed upon.

ARGOL is a crude variety of cream of tartar which forms a crust in the interior of wine-vats and wine-bottles. Originally, it exists in the juice of the grape, and is soluble therein; but during the fermentation of the juice, and as it passes into wine, much alcohol is developed, which remaining

in the fermenting liquor, causes the precipitation of the A.; the latter being very sparingly soluble in an alcoholic liquid. Some wines, when they are bottled, are not fully ripe, and more alcohol being thereafter developed, a further precipitation of A. takes place as a crust in the bottles, and hence the meaning of the term *crusted port*. A. is generally of a reddish tinge, obtained from the colour of the grapes, but sometimes is of a greyish-white colour, when it has been deposited during the fermentation of the juice of colourless grapes. The *red* or *white* A. is denominated in commerce *crude tartar*, and its principal uses are in the preparation of cream of tartar (q. v.) and tartaric acid (q. v.). The constituents of A. are bitartrate of potash (cream of tartar), (KO.HO.T), tartrate of lime, with colouring and extractive matters.

ARGOLA. See ADJUTANT.

ARGOLIS, a peninsula of the Morea (Greece), lying between the bays of Nauplia and Ægina, forms with Corinth a nome, or department, in the modern kingdom of Greece. The plain of Argos, famous in ancient times for its breed of horses, is naturally fertile, but is now made pestilential by morasses. It is surrounded by an eastern continuation of the range of mountains on the north of the Peloponnesus, which also girds the river and shattered-looking coast. The highest summits attain an elevation of between 5000 and 6000 feet. The plain of A. is the most extensive in the whole peninsula, being 12 miles in length and 5 in breadth. The eastern part is higher and more rocky than the western. Near where the plain opens on the sea, the ground is marshy. This was the Lernean marsh of antiquity. The nome, or department, has now Nauplia as its capital, and contained in 1861 113,719 inhabitants.

It was from the importance of the ancient kingdom of A. that the Greeks were collectively often styled Argivi by ancient writers. A. was colonised in very early times. According to the old traditions, Inachus, the Pelasgic chief, settled here in 1800, and Danaus in 1500 B.C., with colonists from Egypt. Here Pelops ruled, and was succeeded by Atreus, Agamemnon, &c. Here also Hercules was born, and achieved his victories over the Lernean hydra and the Nemean lion.

The ancient capital, Argos, was situated about 3 miles from the sea, and was considered the oldest city in Greece. It was supposed to have been built by that Inachus of whom we have spoken, or by his grandson Argus; but as the whole period in which his deeds are said to have been accomplished belongs to the unhistorical age, we cannot possibly determine the truth of such a statement. It is certain, however, that at one period A. was the head of a league composed of several Doric states or cities—Cleone, Phlius, Sicyon, Trœzen, Herminione, Ægina, and Epidaurus. Latterly, Sparta robbed it of its supremacy and influence. The population of A., during its most prosperous condition in ancient times—inclusive of the town territory—upwards of 100,000. It was noted for the attention it paid to the worship of the gods. Juno was the principal divinity, but many of the other gods had temples and statues also. This gave a stimulus to the fine arts, and we know that A. possessed one of the most famous of the ancient schools of statuary. The natives were, moreover, renowned for their love of music. Herodotus considered them the finest musicians in Greece. They do not, however, seem to have cultivated literature. Few poets, and no orators or philosophers, were born amongst them. The modern Argos, built on the site of the ancient, is 7 miles from Nauplia, and is a large and thriving

town. It still exhibits some remains of antiquity, though these were nearly wholly destroyed in 1825, during the Greek war of independence. Cotton, vines, and rice are grown. Pop. 8000.

ARGONAUT (*Argonauta*), a genus of cephalopodous mollusca, pretty generally known by the name of *Paper Nautilus*, and in consequence of similarity in the form of the shell, often confounded with the genus *Nautilus* (q. v.), but in fact much more nearly allied to the Poulpe (*Octopus*). The shell is not chambered like that of the true nautilus, but has one spiral cavity, into which the animal can entirely withdraw itself. The animal has no muscular attachment to the shell, and some naturalists therefore suspected that it might be merely, like the Hermit Crab, the inhabitant of a shell originally belonging to some other animal; but this question has been set at rest by the observations of Madame Power, proving the beautiful but fragile shell to be the production of the A. itself. It has, however, also been discovered that the shell is peculiar to the female A., and does not answer the ordinary purposes of the shells of mollusca, but rather that of an

misapprehension of the position of the animal in its shell, and of the use of the two expanded arms or *vela* (sails). The membranes of these arms are extended at the pleasure of the animal, so as to envelop the shell, and appear to be the secreting organs employed in its fabrication. Two species of A. are common in the Mediterranean. Fig. 1 represents one of them as it used to be commonly represented with oars and sails. Fig. 2 represents it as it really exists, with the membranes of the dorsal arms covering the shell. The other arms are cut off. At a, in fig. 2, is seen the mass of eggs.

ARGONAUTS, heroes of Greek antiquity (so named from their ship *Argo*), who, according to tradition, about a generation before the Trojan war, undertook a long voyage into unknown seas, under the command of Jason. Homer alludes to the story; Hesiod, Mimnermus, Pindar, the Pseudo-Orpheus, and many others relate it, all in different ways, the accounts in some instances being utterly irreconcilable. The plainest and most complete narrative is that of Apollodorus, which is as follows: Jason was commissioned by his uncle, Pelias—who ruled over Iolcus, in Thessaly—to fetch from the country of Æetes (Colchis) the golden fleece of the ram, which was suspended on an oak, and guarded by a sleepless dragon. He therefore caused Argus, the son of Phrixus, to build a ship of fifty oars; and in pursuit of this adventure, gathered together the choicest heroes from all parts of Greece, fifty in number, with whom he sailed. Their first landing-place was Lemnos, where the A. stayed two years, because the women, in consequence of the wrath of Aphrodite, had slain all the men, excepting Thoas. Next they sailed to the Doliones, and were hospitably received by King Cizyeus, who was afterwards accidentally killed by Jason. After landing at Mysia, where they left Hercules and Polyphemus—who had wandered too far inland in pursuit of the lost Hylas—they came to the country of the Bebryces, where King Amycus was killed by Pollux, or Polydeuces, in a pugilistic fight. They next sailed along the coast of Thrace to Salmydessus, where two of their number, Zetes and Calais, having delivered the blind seer, Phineus, from certain winged monsters called Harpies, he in return gave them good counsel respecting their future adventures, and especially warned them against the dangerous passage between the opening and closing Symplegades, from which they escaped with but little injury to their vessel. The story goes that Phineus advised the A. to let loose a dove when they approached the dreaded rocks, and to judge from its fortune what they themselves might expect. The bird escaped with the loss of its tail. The A. resolved to risk the passage, and after heroic efforts, got safely through, their ship only losing some of the ornaments of its stern. After visiting several other lands, they arrived at the mouth of the river Phasis, in Colchis. Here the king, Æetes, promised to give up the golden fleece to Jason, on condition that the latter should yoke to a plough the two fire-breathing bulls with brazen hoofs, and should sow the dragon's teeth left by Cadmus in Thebes. Jason, by the help of the famous sorceress Medea, daughter of Æetes, who had fallen passionately in love with the bold navigator, fulfilled these conditions; and was also assisted by Medea in still more wonderful exploits. He obtained from her, under promise of marriage, a charm against fire and steel, and was enabled to destroy all the warriors who sprang up from the land sown with the dragon's teeth. While this was taking place, Æetes had resolved to burn the ship *Argo*, and put to death the crew; but Jason, informed of the scheme by Medea, anticipated it, hastened into the grove, stupified the dragon-sentinel

Fig. 1.

'incubating and protective nest.' The eggs, which are very numerous, are attached to filamentary stalks, and by these the whole compacted mass is united to the involuted spire of the shell, where it is usually concealed by the body of the parent. The descriptions, until recently admitted into the works of the most respectable naturalists, of argonauts sailing about in pretty little fleets upon the surface of the water, employing six of their tentacula as oars, and spreading out two, which

Fig. 2.

are broadly expanded for the purpose, as sails to catch the breeze, are now regarded as entirely fabulous, and indeed are founded upon an entire

by an opiate-charm prepared by Medea, seized the golden fleece, and, embarking in the *Argo* with his mistress and her brother Absyrtus, sailed away from Colchis by night. Æetes followed, but was hindered in his pursuit by an atrocity committed by his fierce daughter. It is said that she slew her brother Absyrtus, and cut him into several pieces, which she threw overboard, one at a time. While King Æetes stayed to gather up the fragments of his son, Jason escaped from the pursuit. The A. now reached the mouth of the river Eridanus; but were driven on the Absyrtian Islands by a storm sent from Jove, who was angry on account of the murder of Absyrtus. Meanwhile the mast of the *Argo*—which had been cut from the sacred grove of Dodona—delivered an oracle to the effect that Jove could not be appeased unless they sailed towards Ausonia, and were purified through the expiatory agency of Circe. This was accomplished; and next, the A. passed by the Sirens, from whose charms they were preserved by Orpheus, who sang to them, but could not hinder one of their number, Butes, from swimming off to the sea-maidens; then through Scylla and Charybdis, by the help of Thetis, and at length landed on the island of Corcyra, where Alcinoüs ruled. On leaving this place, they encountered a storm at night, but were saved by Apollo, who, in flashes of lightning, revealed to them the haven of Anaphe, where they raised an altar to their preserver. At Crete, their landing was opposed by the giant Talus, who was slain by Medea. They subsequently touched at Ægina, and sailing between Eubœa and Locris, arrived safely at Iolœus, after a four months' voyage. Jason dedicated the good ship *Argo* to Neptune, at the Isthmus of Corinth.

It is perhaps useless to speculate on the real character of the Argonautic expedition, even if it be more than a mere myth. The accounts given by other writers differ so widely, especially in the geographical parts, from those of Apollodorus, that it becomes impossible to determine satisfactorily whether the expedition sailed north, east, or west. The common historical interpretation of the legend is that Jason sailed on a voyage of discovery, which had for its aim and stimulus the hope of new commercial relations; others would modify this hypothesis, and suggest that the enterprise was partly commercial, partly pirical, and partly adventurous, and that Jason's crew was in all probability composed of young, restless, and ambitious spirits, who were ready for anything that might turn up.

ARGOSTOLI, a seaport on the south-west of Cephalonia, and capital of the island. Its lat. is 38° 10' N., and long. 19° 50' E. Its pop. is 5000; and its quay is a mile long.

ARGUELLES, AUGUSTIN, a prominent Spanish politician of the modern liberal school. On the breaking out of the War of Independence in 1808, he went to Cadiz, where he agitated for the organisation of a regency along with a free constitution, as the best method of strengthening and consolidating the powers and resources of the nation. In 1812 he was sent as representative of his native province to the Cortes, where he was appointed one of the members of the committee to whom were intrusted the drawing up of the plan of a new constitution. His splendid talents as a public speaker soon won him the admiration of the liberal party, who used to term him the Spanish Cicero. But on the return of Ferdinand VII., A. fell a victim to the reactionary spirit which ensued. On the 10th of May 1814, he was arrested and imprisoned; but at his trial he displayed such dexterity that it was found impossible to convict him. Different judges were nominated five successive times, but

they could not agree in their decision. At last the monarch himself passed sentence, which was, that A. should be confined for ten years in the prison at Ceuta. He was not, however, alone in his misfortunes. Fourteen persons were condemned along with him, amongst whom was his friend Juan Alvarez Guerra. In their confinement they experienced such barbarous treatment, that in four years three died, two became mad, and the rest received grievous injuries. The revolution of 1820 restored them to freedom. A. became Minister of the Interior, but soon resigned, in consequence of the king complaining of the weakness of the executive. Although provoked beyond measure by the narrow bigotry of the court, he did not rush into extremes, but continued a constitutional liberal to the end of his life. In the Cortes held in Seville in 1823, he voted for the suspension of the royal power; but after the violation of the constitution he fled to England, where he remained till the amnesty of 1832. On his return to Spain, being nominated to the Cortes, he was repeatedly made president and vice-president of the Chamber of Deputies, and always shewed himself a moderate but unwavering reformer. In July 1841, on the discussion of the law regarding the sale of church property, he delivered himself strongly against all concordats with the pope. Next to Espartero, he was the most popular man in the kingdom with the enlightened party. During the regency, he was appointed guardian to the young queen, Isabella, but died soon after, on the 23d of March 1844, at Madrid. In his old age, he still exhibited the fiery eloquence that marked his youth.

ARGUMENT (Lat. *argumentum*), in Logic, means properly the ground or premiss on which a conclusion is rested; popularly, it is applied to a series of arguments, or to a controversy. *Argumentation* is reasoning put into regular shape, with a view to convince or silence an objector. Logicians have given distinctive names to various kinds of arguments. Thus, we have the *Argumentum ad hominem*, which is no real proof, but only an appeal to the known prepossessions or admissions of the persons addressed. In this style, when a man upholds one method of fraud, he may, by an appeal to his consistency, be driven to uphold another. The A. *ad veritatem*, again, has no regard to anything save objective truth. Next we have the A. *e consensu gentium*, or an appeal to the common belief of mankind, which, of course, may be used to prove or disprove anything. The A. *a tuto* rests upon the supposed safety or prudence of adopting a certain conclusion. It is sometimes used by Roman Catholics against Protestants in the following form: Protestants teach that salvation is possible in any church; this is denied by Catholics; therefore, it is safer to belong to the Catholic Church, as even the Protestants admit that a man may be saved in that church. Lastly, the *Argumentum a baculo* (or use of the cudgel), though objectionable, is concise in its style, and has settled many controversies.

ARGUMENTUM AD HOMINEM. See ARGUMENT.

ARGUS, the son of Zeus and Niobe, succeeded Phoroneus in the government of the Peloponnese, which took from him its name of Argos, as did also the territory of Argolis.—A., surnamed Panoptes (all-seeing), had one hundred eyes, some of which were always awake. He was enormously strong, and on account of the wonderful exploits he performed, Juno appointed him to watch over Io, transformed into a cow. Mercury being commissioned by Zeus to carry off the cow, slew A. by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then beheaded him. Juno

used the eyes of *A.* to decorate the peacock's tail.—*A.* the builder of the ship *Argo* (see ARGONAUTS).

ARGUS, a genus of gallinaceous birds, remarkable for magnificence of plumage. The only known species is *A. giganteus*, formerly called *Phasianus A.*, and still very generally the *A.* pheasant. The sides of the head and of the neck are destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated; the secondary feathers of the wings are much longer than the primary. The name *A.* has allusion to the many beautiful eye-like

Argus.

markings which adorn the plumage of the male, and particularly the secondaries of the wings. The long secondaries are said to impede the flight of the bird; but its wings are much employed to aid it in running. The female is of comparatively tame plumage, not only wanting the eye-like markings, but even the great length of the secondaries and of the middle-tail feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl, but the tail-feathers of the male are nearly four feet long. The *A.* is a native of Sumatra and other eastern islands, of the peninsula of Malacca, Siam, &c. It is said to be found even in the northern parts of China. It is impatient of confinement, and has very seldom been brought alive to Europe.

ARGYLE, ARCHIBALD CAMPBELL, MARQUIS OF, an eminent political character of the 17th c., was born in 1598, and succeeded to the earldom of *A.* in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war. In the General Assembly at Glasgow, in November 1638, he openly took the side of the Covenanters, and thenceforth became recognised as their political head. In 1640, he commanded a military expedition through Badenoch, Athole, Mar, and Angus, for the purpose of enforcing subjection to the Scottish Parliament. On the king's visit to Scotland, in 1641, he found it convenient to shew peculiar favor to *A.*, and created him a marquis. On the breaking out of hostilities, *A.* was still desirous for negotiation, but was finally compelled to take the field. In April 1644, he dispersed the royalist forces under the Marquis of Huntly, in Aberdeenshire. He was less successful in withstanding the genius of Montrose,

who, on the 2d February 1645, almost annihilated his army at Inverlochy. His estates had suffered so much in the preceding year with the ravages of the brilliant Cavalier, that a sum of public money was voted for his support. In August (1646), he went to London, with London and Dunfermline, to treat with the parliament for a mitigation of the articles presented to the king. He was at the same time the bearer of a secret commission from the king to treat with the Duke of Richmond and the Marquis of Hertford, on the propriety of a Scottish demonstration in favour of Charles. On the defeat of the 'Engagement' plan, to which he had been decidedly opposed, the government of Scotland devolved on *A.* and the other Presbyterian leaders. In the parliament of February 1649, Charles II. was proclaimed king, and at Scone, on the 1st of January 1651, *A.* put the crown on his head. At this time, it was even said that the complaisant monarch intended to marry one of his daughters. As head of the Committee of Estates, *A.* took vigorous measures to oppose Cromwell's invasion of Scotland, and still adhered to the king, after the subjugation of the country. After the battle of Worcester, he retired to Inverary, where he held out for a year against Cromwell's troops. Falling sick, he was taken prisoner by General Dean. He refused submission to the Protector, but took an engagement to live peaceably, which he strictly kept. On the Restoration, he repaired to Whitehall, encouraged by a flattering letter from the king to his son. Impeached with the crime of having submitted to the usurper (to whom he had refused allegiance), he was committed to the Tower, and on the 13th February 1661, was brought before the Scottish Parliament on the charge of treason. He defended himself with spirit, but in vain. On the 27th May he was executed at Edinburgh—having displayed throughout his whole trial, and on the scaffold, the dignity of a true nobleman, and the meekness of a Christian.

His son, ARCHIBALD, 9TH EARL OF *A.*, was early distinguished by personal accomplishments, and exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the royal side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to the parliamentary leaders, that he was specially excepted by Cromwell from the act of grace in 1654. After much harassing persecution he submitted to the parliament, but continued to be closely watched. On the restoration of Charles II., he was received into high favour (as a balance to the execution of his father), and unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish legislature. He had, however, numerous and active enemies; and, on the ground of an intercepted letter, in which he had complained of neglect, he was tried and condemned to death by the Scottish Parliament for the imaginary crime of *læsa majestas*. The influence of Clarendon restored him to liberty and favour; even the king himself was prejudiced in his favour; but a new opportunity was offered to the malice of his enemies, by his explanation in subscribing the infamous test framed by the Scottish Parliament in 1681. He was indicted for treason, and again condemned to death by a jury of his peers. The devotion of his wife enabled him to escape from Edinburgh Castle, in the disguise of a page; and after remaining concealed some time in Derbyshire and the vicinity of London, he fled to Holland. Landing in the North of Scotland, in May 1685, with an armed force, to co-operate in the revolt of Monmouth, he was, after a series of misfortunes, taken prisoner, hastily tried, condemned, and beheaded, June 30, 1685.

ARGYLE, JOHN CAMPBELL, DUKE OF, was born in 1678, and took an important part in political and military affairs in the reigns of Queen Anne and her successor. As royal commissioner in 1705, he had a principal share in bringing about the Act of Union. As a soldier, he distinguished himself under Marlborough at Ramillies, Oudenarde, Lille, Ghent, and Malplaquet. Previous to the change of ministry in 1710, A. had been a keen whig. He now veered with the wind of the court, and became a declaimer against the Duke of Marlborough. As the reward of his apostacy, he was appointed by the Tories generalissimo of the British army in Spain; but considering himself to have been unhandsonely treated by the ministry, he shortly after returned, and finding his influence greatly diminished, he again became a Whig. His career up to the rebellion of 1715, was most tortuous and unprincipled, and seriously detracts from his meritorious services during that critical period. He was, however, completely successful in quelling disturbances, and his services were rewarded in 1718, among other dignities, with an English peerage, and the title of Duke of Greenwich. His restless vanity and ambition, however, constantly prompted him to political intrigues. In 1721 he again played into the hands of the Tories, for the purpose of securing the entire patronage of Scotland. In 1737 he rose into immense popularity in his own country, by his spirited defence before parliament of the city of Edinburgh in regard to the Porteous mob. He died on the 3d September 1743. He was a man of lax principles and selfish character, but possessed of considerable shrewdness and talent, and noted for his kindness and courtesy in private life. The benevolence of his disposition procured him the title of 'the Grand Duke of Argyle.'

ARGYLE, DUKE OF. George John Douglas Campbell, 8th Duke of A., was born in 1823, and succeeded his father in 1847. At the age of 19, his Grace, then Marquis of Lorn, gave evidence of unusual ability in a pamphlet entitled *A Letter to the Peers from a Peer's Son*, on the subject of the struggle which ended in the disruption of the Scottish Church. Seven years subsequently, he gave proof of more extensive study in the same field, by the publication of his Essay on Presbytery, which contains an elaborate historical vindication of the Presbyterian system against Prelacy. On taking his seat in the House of Peers, he soon gave proof of considerable oratorical ability, and both by the maturity of his judgment and the readiness of his powers, commanded the respect of that dignified assembly. On the formation of the coalition ministry by Lord Aberdeen, his Grace was considered of sufficient importance to receive a place in the government, and was invested with the office of Lord Privy Seal, which he continued to hold in Lord Palmerston's administration. In November 1855, he relinquished his office, and accepted that of Postmaster-general. On the fall of Lord Palmerston's administration, he retired into opposition; but in 1859, on that nobleman's return to the helm, he again accepted the office of Lord Privy Seal, and was again appointed Postmaster-General in 1860. His Grace has distinguished himself not only in politics but in science. In 1854 he was chosen Lord Rector of the university of Glasgow, and in 1855 presided at the meeting of the British Association in that city. He is also Chancellor of the university of St. Andrews. In 1844 he married Lady Elizabeth Georgiana Gower, eldest daughter of the Duke of Sutherland, and niece of the Earl of Carlisle. In 1866 he published *The Reign of Law*, and in 1868 was Secretary for India.

ARGYLESHIRE (*Earrra Ghaidheal*, West Gael

Country), an extensive maritime county in the West of Scotland, including numerous islands, and a large mainland track, cut up into many peninsulas by arms of the sea. It is bounded, N. by Inverness-shire; W. and S. by the sea; E. by Perthshire, Dumbarton, Loch Long, and Firth of Clyde. Its greatest length is about 115 miles; its greatest breadth, about 60 miles; its extent of coast-line is very great, amounting to 663 miles, owing to the indentation of the coast by numerous lochs running inland. Next to Inverness, it is the largest county in Scotland—area, 3210 square miles, of which 1063 are occupied by the numerous islands. No part is above 12 miles from the sea or from large inland lochs. The county is divided into the districts of Cantire, North and South Argyle, Lorn, Appin, Cowal, Morven, and Sunart. The chief islands are Mull, Islay, Jura, Tiree, Coll, Lismore, and Colonsay. There are upwards of thirty other islands of smaller size. The general aspect of A. is wild and picturesque, marked by rugged and lofty mountains, deep inland bays, and often precipitous coasts. Some fertile valleys exist. The north part is entirely mountainous, and presents some of the grandest scenery in Scotland, as Glencoe. The highest peaks are (Ord.Trig. Survey)—Bedan-ambran, 3760 feet; Ben Cruachan, 3668; Buachael Etive, 3341—all in Lorn; Ben Ima (end of Loch Long), 3319; Ben More (Mull), 3174; Ben Creach (Morven), 2790; North Pap of Jura, 2567. The chief bays are (going south)—Loch Moidart, Loch Sunart, Linnhe Loch, branching off into Loch Eil and Loch Leven, Loch Fyne, and Loch Long. There are no rivers of any size. The streams are short and rapid, the principal being the Urchvy, running through Glanorchy into Loch Awe, and the Awe connecting that lake with Loch Etive. The inland or fresh-water lochs are Loch Awe and Loch Lydoch. The rocks of A. are mica-slate, which predominates on the mainland; trap in Mull and Lorn; quartz rock in Islay and Jura; granite around Loch Etive and in Knapdale; patches of lias and oolite in many of the isles; and a little old red sandstone west of Loch Fyne and in South Cantire. Lead-mines occur at Strontian (where the mineral Strontianite was discovered, and from which the names of the earth called *Strontia* and the metal *Strontium* are derived) at Tyndrum, and in Islay and Coll. A copper-mine exists in Islay. The Easdale and Ballachulish quarries supply the best roofing-slates in Scotland. Coal occurs near Campbellton; fine marble in Tiree, &c.; excellent granite near Inverary; and limestone in most parts of the county. The fertile parts of A. lie along the arms of the sea and the mountain streams. The soil is mostly a light, sandy, and gravelly loam, along the coast and the sides of rivers, and gravelly, with a till bottom, on the hill-sides. Sheep and cattle rearing are the chief occupations of the farmer. More sheep are reared in A. than in any other Scotch county, and nearly a million acres are in permanent pasture. In number of cattle, A. yields only to the counties of Aberdeen, Ayr, and Perth. In 1857, 838,535 bushels of oats, and 109,657 tons of turnips, were raised. A. abounds in deer and game. Loch Fyne is famed for the abundance and quality of its herrings. Loch Awe abounds in salmon, and in trout unrivalled in size.

In many parts of A. the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with the commercial centre of Scotland. The manufactures are unimportant, the chief being whisky, in Campbellton and Islay, and coarse woollens for home use. The chief towns and villages are Inverary, Campbellton, Oban, Dunoon, Appin, Lochgilphead, and Tarbert. The three former unite with Ayr and Irvine in

returning one member to parliament; the county returns another. Pop. in 1861, 83,859, represented as mostly using the Gaelic language. This exhibits a decrease of 20,000 since 1831, which has chiefly resulted from emigration. Day-schools, 201, with 11,847 pupils; places of worship, 117—48 of Established, 39 of Free Church, and the remainder divided amongst various small sects. The principal proprietors are the Duke of Argyll, the head, and the Marquis of Breadalbane, a branch of the Campbell family. Among the antiquities of A. may be mentioned the ruins of Iona and Oronsay, and many *duns*, or circular forts, along the coast. In Cantire formerly lived the famous Macdonalds, or Lords of the Isles, whose power was weakened by James III.

ARIA (*AIR*), in Music, a rhythmical song, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. **ARIETTA**, a short melody. **ARIOSO**, a passage in the style of the A., often introduced into recitative. **A. BUFFO**, a comic song, &c.

ARIA'DNE, daughter of Minos, king of Crete, by Pasiphaë. When Theseus, with the offerings of the Athenians for the Minotaur landed in Crete, A. conceived a passion for the beautiful stranger, and gave him a clew by means of which he threaded the mazes of the labyrinth, and was enabled to slay the monster. For this service, Theseus promised to marry her, and she escaped with him, but was slain by Diana on the island of Naxos. —According to another tradition, A. was left by Theseus at Naxos, where she was found by Bacchus returning from his triumph in India, who was captivated by her beauty, and married her. At her death, he gave her a place among the gods, and suspended her wedding-crown as a constellation in the sky. A., as left forsaken by Theseus, and as married to Bacchus, has been a favorite subject with artists.

ARIA'LDUS, a deacon of the church of Milan, who flourished during the 11th c. He took a prominent part in the ecclesiastical contentions of his times. The Catholic Church in the north of Italy was then very corrupt, a wide-spread licentiousness, originating from the unnatural institution of priestly celibacy, prevailed. Great numbers of the clergy kept concubines openly. Such as looked earnestly in those days at this flagrant evil, were disposed to consider the strict enforcement of celibacy the only effectual cure. Chief among these reformers stood A., whose life was one continued scene of violent controversy. Although successively sanctioned by Popes Stephen X., Nicholas II., and Alexander II., he found little sympathy among his brethren, and used to complain that he could only get laymen to assist him in his agitation. Having at length succeeded in obtaining a papal bull of excommunication against the Archbishop of Milan, a fierce tumult ensued in the city, whose inhabitants declared against A. and his coadjutors. A. now fled to the country; but his hiding-place being betrayed, he was conveyed captive to a desert isle in Lake Maggiore, where he was murdered by the emissaries of the archbishop, and his remains thrown into the lake, June 28, 1066. He was afterwards canonized by Pope Alexander II.

ARIA'NA. See **ARYAN RACES**.

ARIANS. See **ARIUS**.

ARIAS MONTA'NUS, **BENEDICTUS**, a Catholic divine noted for his great linguistic attainments, was born, 1527, in the village of Frexenal de la Sierra,

situated amongst the mountains separating Estremadura from Andalucía. He studied first at Seville, and afterwards at Alcalá de Henares, where he distinguished himself by the ardour he manifested in the acquisition of the oriental languages, Arabic, Syriac, and Chaldee. He next proceeded on a tour through Italy, France, Germany, England, and the Netherlands, in the course of which he obtained a knowledge of various modern tongues. He was present at the celebrated Council of Trent; but on his return to his own country, he resolved to retire into seclusion, and dedicate his whole time to Literature. In 1568, however, Philip II. persuaded him to repair to Antwerp and superintend the publication of the famous edition of the 'Polyglot Bible,' executed in that city at the suggestion of the printer, Christopher Plantin. After four years' labour, the work was issued under the title *Biblia Sacra, Hebraice, Chaldaice, Græce, et Latine, Philippi II. Regis Catholici Patris et Studio ad Sacrosanctæ Ecclesiæ Usum Chph. Plantinus excudebat*. It was received with universal applause. The Jesuits, to whom A. was sincerely and strenuously opposed, alone attempted to fasten the charge of heresy on the author, who made several journeys to Rome to clear himself of the accusation. Philip II. rewarded him with a pension of 2000 ducats, besides bestowing on him various other emoluments. He died at Seville in 1598. His literary works are very numerous. They relate principally to the Bible and to Jewish antiquities; but he also wrote a poem on Rhetoric, and a History of Nature.

ARICA, a seaport of Moquega, the most southerly department of Peru, in lat. 18° 28' S., and long. 70° 24' W. Though it has merely a roadstead, it affords safe anchorage to shipping, and is one of the chief outlets of the trade of Bolivia, being connected with La Paz in that republic by a mule-path which leads across the west Cordillera of the Andes. Its exports mostly consist of copper, silver, alpaca wool, and guano. A. is subject to intermittent fevers, and has frequently suffered from earthquakes. It is, therefore, merely a village, though possessed of a custom-house, a pier, and a battery. The leading merchants do not reside at A., but at Tacna, about 30 miles up the country, the chief city of the department, with 10,000 inhabitants.

ARICHAT, a seaport of Cape Breton Island, in the province of Nova Scotia, in lat. 45° 28' N., and long. 61° 3' W. It is near the Gut of Canso, which separates Nova Scotia Proper from Cape Breton, being the most southerly of the three channels of communication between the Gulf of St. Lawrence and the open Atlantic. It has about 17,500 inhabitants, and is largely engaged in fishing.

ARIÈGE, or **ARRIÈGE**, a river in the south of France, rises in the department of the East Pyrenees, flows through a beautiful vale, and falls into the Garonne near Toulouse.—The department of **ARIÈGE**, which lies along the northern slopes of the Pyrenees, formed a part of the old county of Foix, the territory of Couserans, and the province of Languedoc, is bounded N. and W. by Haute Garonne, E. by Aude, S. by the republic of Andorra and the Pyrenees. It contains some of the highest mountain-summits in France, such as Fontargente, 9164 feet; Serrère, 9592 feet; Montcalm, 10,513 feet; Estats, 10,611 feet; Montaliér, 9120 feet. The department, nevertheless, has a mild climate. Pop. 251,850. These are engaged chiefly in agriculture, pasturage, iron mines, and the manufacture of woollens, linen, pottery, &c. The three arrondissements are Foix, Pamiers, and St. Giron. Chief towns—Foix, Pamiers, and St. Giron.

ARIES, the Ram, one of the signs of the zodiac,

including the first 30 degrees of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place. The vernal equinox, or, as it is also called, the first point of A., is constantly changing its position among the fixed stars, in consequence of the precession of the equinoxes, moving westward at the rate of 50".2 annually. It is from this circumstance that the sign A. no longer corresponds with the constellation A., which was the case about 2000 years ago, when the ecliptic was divided into 12 equal parts called signs, each named after the group of stars through which it passed. The present sign A. is in the constellation Pisces, about 30° west of the original sign; and although the sun at the vernal equinox will always be at the first point of A., yet nearly 24,000 years will elapse before that point will again coincide with the beginning of the constellation A.

ARIL (*arillus*), a peculiar covering of the seed in some plants, formed by an expansion of the *funiculus* (the cord which attaches the ovule to the *placenta*) or of the placenta itself. This expansion takes place after fertilisation, and sometimes invests the seed entirely, sometimes only partially. In the nutmeg, the A. forms what is called *mace*. In the spindle-tree (*Euonymus Europæus*), it forms the remarkable orange-coloured covering of the seed.

ARINOS, a river of Brazil, which after a north-west course of 700 miles, enters the Tapajos, itself an affluent of the Amazon, in lat. 9° 30' S., and long. 50° 20' W.

ARION, a celebrated lute-player, a native of Methymna, in Lesbos, about 700 B.C., was regarded by the ancients as the inventor of the dithyrambic metre. According to a tradition first given by Herodotus, and afterwards decorated by the poets, A. was sent by Periander, ruler of Corinth, to Sicily, and Italy, and at Tarentum won the prize in a poetical contest. As he returned laden with gifts in a Corinthian ship, the avaricious mariners determined to slay him and seize his wealth; of this the poet-musician was forewarned by Apollo in a dream. He asked for permission to try his skill in music; and after playing on his lute, threw himself from the deck into the sea. Here several dolphins, charmed by his music, had assembled round the vessel. On the back of one of them the musician rode safely to the promontory of Tænarus, where he landed, and journeyed on to Corinth. The sailors who, arriving afterwards, assured Periander that A. was dead, were confronted with him, when they confessed their guilt and were crucified. The lute and dolphin were raised among the constellations; and the story became a favourite theme with artists. A. W. Schlegel, in one of his best poems, gives this story of A.

ARIOSTO, LUDOVICO, one of the greatest of Italian poets, was born at Reggio, September 8, 1474, being the eldest son of the military governor of that city. He was bred to the law, but abandoned it for poetry. However, at an early period of life, he was compelled to exert himself for the support of a large family, left as a burden on him at the death of his father. His imaginative powers were developed in early life. In 1503, after he had written two comedies, with several lyrical poems in Latin and Italian, he was introduced to the court of the Cardinal Hippolytus d'Este, who employed him in many negotiations. Here, in Ferrara, in the space of about ten years, he produced his great poem *Orlando Furioso*, which was published in that city, in one volume 4to, in 1516, in forty cantos. After the death of the cardinal, the duke, his brother, invited the poet to his service, and acted to

him with great kindness and liberality. In the early part of 1521, a second edition of his poems was published, the *Orlando Furioso* being still in forty cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain district of Garfagnana; a task which seems more like a punishment than a mark of honour. A., however, succeeded in this arduous undertaking; and after remaining three years governor of the quarter, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies. It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in the latter part of 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of forty-six cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he died on the 6th of June, 1533, in his fifty-ninth year, and was buried in the church of San Benedetto, at Ferrara, where a magnificent monument indicates the resting-place of his remains. A. is described as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo, the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland, stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story of this lady being left unfinished in the *Orlando Innamorato* is taken up by A., who makes her fall in love herself with an obscure juvenile squire, on which Orlando gets furious, and long continues in a state of insanity. Besides his great work, A. wrote comedies, satires, sonnets, and a number of Latin poems, all more or less marked with the impress of his genius. In 1845, Giamperi, a librarian of Florence, announced that he had discovered at Argenta, near Ferrara, an autograph manuscript by A., containing a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins against the Saracens. The manuscript had been mutilated, and contained in a complete form only the cantos 3, 4, 5, while 2 and 6 were imperfect; and it was stated that the entire poem had consisted of twelve cantos. The work was published under the title *Rinaldo Ardito di L. Ariosto, Frammenti Inediti Pubblicati sul Manoscritto Originale*. (Florence, 1846). In genius and style, it has been found by critics by no means to accord with the *Orlando*. Of the *Orlando* there are three several translations into the English language: the first, by Sir John Harrington, appeared in the year 1634; the second, by John Hoole, in 1783; and the third by W. Stewart Rose, in 1823 and following years. In the last only is there to be found a fair representation of the feeling and spirit of the original.

ARIOVISTUS (probably the Latinised form of the German *Heer-fürst*, army-prince), a German chief, leader of the Marcomanni and other German tribes, was requested by the Sequani, a Gallic people, to assist them in a contest against the Ædui. Having gained a victory for the Sequani, A. was so well pleased with their fine country (now Burgundy), that

he and his followers determined to abide there. Many other Germans followed him into Gaul, where he soon collected an army of 120,000 men. The Gallic people turned now for help towards the Romans, and Cæsar demanded an interview with A., who proudly replied, that 'he did not see what Cæsar had to do with Gaul.' After another message from Cæsar had been treated in the same scornful manner, the Roman forces under Cæsar advanced and occupied Vesontium (now Besançon), the chief city of the Sequani. A furious engagement took place (58 B.C.), in which the Roman discipline prevailed over the German forces, which were utterly routed. A., with only a few followers, escaped over the Rhine into his own country. His subsequent history is unknown.

ARI'SPÉ, the capital of Sonora, the extreme north-west department of the Mexican Confederation. It is situated in the Sierra Madre, the western range of the Rocky Mountains, on the banks of the Sonora, which is said to lose itself in an inland lake. Its population has been estimated as high as 7600. The surrounding district abounds in the precious metals, as also in cotton, wine, grain, and live-stock.

ARI'STA and ARI'STATE. See AWS.

ARISTAEUS (from a Greek word signifying *the best*), an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo, and Cyrene, the latter the grand-daughter of Pe-neius, a river-god of Thessaly. She is said to have given birth to A. on the coast of Libya, in Africa, whence the region is alleged to have derived its name of Cyrenaica. Hermes placed the child under the protection of the Horæ, the fosterers of cities, culture, and education. According to another tradition, A. was the son of the nymph Melissa, who fed the infant with nectar and ambrosia, and afterwards intrusted his education to Chiron. The great diversities in the legend were probably caused by the fusion into one of separate local divinities, whose functions were similar, and whose histories were, in consequence carelessly commingled. After A. left Libya, he went to Thebes, in Boëtia, where he was taught by the Muses the arts of healing and prophecy, and where he married Autonoe, the daughter of Cadmus, by whom he had several children. After the unfortunate death of his son Actæon (q. v.), he went to Ceos, where he liberated the inhabitants from the miseries of a destructive drought by erecting an altar to Zeus *Icmæus*—i.e., the rain-maker. He now returned to his native land; but shortly after, set out on a second time on a voyage of beneficence. He visited the islands of the Ægean Sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. At last he went to Thrace, where he was initiated in the mysteries of Dionysus; and after a brief residence in the vicinity of Mount Hæmus, he disappeared from the earth.

This myth is one of an extremely pleasing character, from the invariable beneficence which is attributed to A. It is less disfigured by anthropopathic errors than most of the myths of Greek divinities. A. was especially worshipped as the protector of vine and olive plantations, and of hunters and herdsmen. He also trained men to keep bee-hives, and averted the burning heats of the sun from the open fields. Later mythology often identified A. with the higher gods Zeus, Apollo, Dionysus.

ARISTA'RCHUS, of SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 281—264 B.C. All his writings have perished, excepting a short essay on the sizes and dis-

tances of the sun and the moon. In this he shews the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half-luminous. It will be obvious from a glance at the annexed figure that the three bodies must then form a right-angled triangle, of which the moon is at the right angle. The angle MES, then, being observed, it is easy to find the ratio between EM and ES. This is quite correct in theory; but the impossibility of determining when the moon is exactly half-illuminated, renders the method useless in practice. Besides in the days of A., there were no instruments for measuring angles with anything like accuracy. A. estimated the angle at E at 83° , and determined EM to be $\frac{1}{20}$ of ES; the truth being that the angle at E differs only by a fraction of a minute from a right angle, and that EM, the distance of the moon from the earth, is about $\frac{1}{410}$ of ES, the distance of the sun. According to some accounts, A. held, with the Pythagorean school, that the earth moves round the sun; but this seems to be a mistake. Vitruvius speaks of A. as the inventor of a kind of concave sun-dial.

ARISTA'RCHUS, of SAMOTHRACE, a grammarian, who lived, about 150 B.C., in Alexandria, where he founded a school of grammar and criticism, and educated the children of Ptolemy Philopator. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets, especially of Homer. The form in which we now have the Homeric poems preserved is in a great measure owing to his judgment and industry. The strictness of his critical principles has made his name a general term for a severely just and judicious critic. Being afflicted with an incurable dropsy, he ended his life by voluntary starvation at the age of 72. The fragments of his writings that have been preserved are to be found scattered through the Scholia on Homer, first published by Villoison (Venice, 1788).

ARI'STEAS, an entirely fabulous character, who may be styled 'the Wandering Jew' of popular tradition in ancient Greece. First we find A. teaching Homer; then, some ages afterwards, born at Proconessus, an island in the Sea of Marmora. It is stated that having visited the Arimaspeæ, the gold-watching griffin, and the Hyperboreans, he died on his return home; but, soon afterwards, a traveller asserted that he had been met and accosted by A. Consequently, neighbours searched the house where the body of A. was supposed to be lying, but it could not be found. Seven years afterwards, he appeared as an author, and wrote a poem entitled *Arimaspeia*, in three books, giving accounts of Northern and Central Asia, which were copied by Herodotus and others. After thus establishing himself as a poet, he vanished again; and after 340 years of mystery, reappeared at Metapontum, in the south of Italy, where he advised the people to erect an altar to Apollo, and an altar to 'the everlasting A.,' assuring them that, when Apollo founded their city, he (A.), in the form of a raven, had accompanied the god, and had assisted in the ceremony. In the early controversy of the Christian Church, heathens sometimes quoted this tale of A., as a counterpart of the miracles recorded in the New Testament.

ARISTIDES, surnamed 'THE JUST,' was the son of Lysimachus, and descended from one of the best

families in Athens. He was one of the ten leaders of the Athenians against the Persians at the battle of Marathon (490 B.C.). It had been arranged that each leader (or *strategos*) should hold the supreme command for one day; but A., who saw the folly of this want of unity, induced his companions to give up their claims, and make Miltiades commander-in-chief, which proved the means of winning the battle. In the following year, A. was chief archon, and in this position, as in every other, secured the general respect of the citizens. Some years later, probably because he had opposed the plans of Themistocles, that unscrupulous leader brought about the banishment of A. It is said that when an illiterate citizen, who did not know him personally, requested him to write his own name on the voting shell, he asked the man whether A. had injured him. 'No,' said the voter; 'but I am weary of hearing him always styled "the Just."' A. submitted to the sentence with dignity, praying to the gods, as he left the city, that the Athenians might not have cause to repent of their decision. Only three years later Xerxes, with an overwhelming force, had invaded Greece. A., hearing that the Greek fleet was surrounded by that of the Persians, hastened from Ægina to apprise Themistocles of the danger, and offer his aid. After taking a prominent part in the battle of Salamis, A. was restored to popular favour, and soon afterwards aided greatly in achieving the victory at Plataea, in which he commanded the Athenians. In 477 B.C. he introduced a change of the constitution, by which all citizens, without distinction of rank, were admitted to political offices. As shewing the confidence reposed in A., it is related that Themistocles having announced that he had a scheme very advantageous for Athens, but which he could not disclose in a public assembly, A. was deputed to consult with Themistocles on the subject. The plan was to secure the naval supremacy of Athens by burning all the vessels of the other Greek states, her allies, then lying in a neighbouring harbour. A. reported to the people that nothing could be more advantageous than the plan of Themistocles, but nothing could be more unjust; and the matter was immediately rejected by the people. After a variety of other public services, A. died in old age, and universally respected, 468 B.C., so poor that it is said his funeral had to be provided for by the public. He left a son and two daughters, for whom provision was made by state bounty.

ARISTIPPUS, the founder of the Cyrenaic school of philosophy among the Greeks, was the son of Aritades, a wealthy gentleman of Cyrene, in Africa, and was born in that city about the year 424 B.C. Having come over to Greece to attend the Olympic games, he heard so much of Socrates, that he was filled with an eager desire to see the sage, and hurried to Athens, where he became one of his pupils. He remained with Socrates up nearly to the last moments of the great teacher, though he does not at any period seem to have followed his doctrines or his practice. We know that subsequently he was the object of strong dislike, both to Plato and to Antisthenes the Stoic. He passed a considerable part of his life in Syracuse, at the court of Dionysius, the tyrant, where he acquired the reputation of a philosophic voluptuary. That his manners must have been at once extremely graceful and accommodating, is clear from the saying of his opponent, Plato, who declared that 'A. was the only man he knew who could wear with equal grace both fine clothes and rags.' Diogenes Laertius records a number of his *dicta*, some of which take the form of *bonis-mots*, and indicate a sharp, cutting, lively, and self-complacent nature. A. also lived at Corinth, in intimacy with the famous courtesan

Lais, but towards the close of his life, he is supposed to have retired to Cyrene. His daughter Arete seems to have been a person of superior abilities, inasmuch as her father imparted his leading doctrines to her, and she to her son, A. the Younger (hence called *Metrodidaktos*, 'taught by the mother'), by whom they are supposed to have been systematised. A., in all probability, published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of the race.

The Cyrenaic school, all the teachers of which were probably imbued with the spirit of A., and merely carried out his doctrines to their legitimate results, professed a great contempt for speculative philosophy, and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony with the gay, self-possessed, worldly, and sceptical character of their master. The chief points of the Cyrenaic system were: 1. That all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and bad. 2. That pleasure consists in a gentle, and pain in a violent motion of the soul. 3. That happiness is simply the result of a continuous series of pleasurable sensations. 4. That actions are in themselves morally indifferent, and that men are concerned only with their results. Wieland in his historico-philosophical romance, *Aristipp und einige seiner Zeitgenossen* (A. and some of his Contemporaries), presents us with a charming picture of the life and opinions of the great philosophic sensualist, who stood out in strong relief against the gloom and austerity of Antisthenes and the Cynical school. See Wendt's *De Philosophiâ Cyrenaicâ* (Gött. 1842).

ARISTOBULUS, an Alexandrian Jew who lived under Ptolemæus Philometer about 175 B.C., and was considered by the early Fathers as the founder of the Jewish philosophy in Alexandria. He was long considered the author of the *Ecegetical Commentaries on the Books of Moses* which went under his name, but it is now admitted that the work in question was the composition of a latter period. Only fragments of it remain. It was intended to shew that the oldest Greek writers borrowed from the Hebrew Scriptures; and to support this theory, numerous quotations were professedly taken from Linus, Musæus, Orpheus, &c., of which the Christian apologists made abundant use. These, however, have long been considered forgeries, inasmuch as they do not exhibit a trace of the antique Greek spirit, but make the writers speak in the tone and style of the Old Testament. See Valckenær's treatise, *De Aristobulo, Judeo* (Leyden 1806).

ARISTOCRACY (Gr. *aristocratia*, from *aristos*, best, and *kratos*, power) means etymologically the power of government of the best, noblest, or most worthy; and in the sense which it originally bore, A. had reference not to a social class, but to a form of government in which the sovereignty was placed in the hands of a minority of the citizens of the state, exclusive altogether of the slave population, which generally existed in antiquity. It is in this sense also that we use it when we speak of the Italian states of the middle ages as aristocracies. In order to constitute an A., it was further necessary that the minority which composed it should consist of the highest class, in point not of wealth alone, but of birth and culture: the government of a minority in numbers simply, being known by the more odious name of an *oligarchy*. Were the whole government

of England intrusted to the House of Lords, even though that body were to become vastly more numerous than it is, so long as it did not include half of the whole adult males, and were not elective, but hereditary, we should be ruled by an A., and our rulers would be aristocrats in the antique sense of the term. In this, its political sense, the term A. has never been acclimatised in England, because the thing which it signifies has always been unknown. Our territorial nobility, though possessing great influence in the government of the country, has, at every stage of its career, been controlled either by the Crown from above or the Commons from below; and thus it is that, though more important as a social influence than in any other country, the English A. has never assumed the form of a ruling-class. When used with reference to English society, the term A. has two significations—a narrower and a wider one. According to the first, it is nearly synonymous with *nobility*. In this sense, it will be treated of under that head, and its relative subdivisions. According to the second, it is synonymous with *gentry*, and includes the whole body of the people, titled and untitled, above a certain very indefinite social line. Perhaps the nearest approximation which we must make to a definition of A. in this, its proper English sense, will be by adopting that which Aristotle has given not of *aristocratia*, but of *eugeneia*, or good birth. 'Good birth,' he says, 'is ancient (long inherited) wealth and virtue.' (*Politic.* lib. iv. c. 7.) The question as to the extent to which either of these qualities is requisite to constitute a claim to admission into the ranks of the A., is one to which probably not two persons, either within or without the pale, would return the same answer; but that the absence of either would be a ground of exclusion, is a point on which there will be little difference of opinion. No amount of mere wealth will, in general, confer it either on a tradesman or his immediate descendants (see GENTLEMAN); and scarcely any deeds, however noble, will give it to him who is not the possessor of inherited fortune. Neither Burns the gauger, nor Shaw the life-guardsmen, has ever been regarded as an aristocrat, though nobody denies that the one was a poet, and the other a hero. But when the claim to recognition as an aristocrat has been inherited, it will scarcely be lost by the individual himself, however adverse may be his worldly circumstances, or however ignoble his conduct; and it is not difficult to imagine an elevation of moral tone which would confer it even on a beggar.

ARISTOGEITON. See HARMODIUS AND ARISTOGEITON.

ARISTOLOCHIA, a genus of plants of the natural order *Aristolochiaceæ* or *Asarineæ*. This order, which is dicotyledonous or exogenous, consists of herbaceous plants or shrubs, often climbing shrubs, and contains upwards of 180 known species, chiefly natives of warm climates, and particularly abundant in the tropical regions of South America. The leaves are alternate, simple, stalked, often with a stipule; the flowers axillary, solitary, hermaphrodite, of a dull colour; the perianth at its base adhering to the ovary, tubular, sometimes regular, but generally very irregular; the stamens 6–12, epigynous (or inserted upon the ovary), distinct, or adhering to the style; the ovary is generally six-celled, with numerous ovules; the style simple, the stigmas radiating, as numerous as the cells of the ovary; the fruit dry or succulent; the seeds with a very minute embryo at the base of fleshy albumen. The genus A. is distinguished by a tubular oblique perianth, generally inflated at the base, the mouth dilated on one side, and by stamens adherent

to the style, so that it is included in the Linnæan class *Gymnandria*. The species are mostly shrubby, and natives of tropical countries, some of them climbing to the summits of the loftiest trees. Several are found in the south of Europe; one only, the common BIRTHWORT (*A. Clematidis*), occurs upon the continent as far north as about lat. 50°, and is a doubtful native of England. It is a perennial plant, with erect, naked, striated stem—heart-shaped dark-green leaves on long stalks—the flowers stalked, and growing to the number of sometimes seven together from the axils of the leaves, the tube of the perianth about an inch long, and of a dirty yellow colour. It grows chiefly in vineyards, hedges, about the borders of fields, among rubbish, and in waste places. It has a long branching root, with an unpleasant taste and smell, which, with the roots of *A. rotunda* and *A. longa*, two herbaceous species, natives

Aristolochia Clematidis.

of the south of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the English name. These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *A. Indica* is used in the same way by the Hindoos. *A. Serpentaria*, VIRGINIAN SNAKE-ROOT, is a native of most parts of the United States, growing in woods. It has a flexuous stem, 8–10 inches high, bearing heart-shaped very acute leaves. The flowers are on stalks, which rise from the root; the orifice of the perianth is triangular. The root has a penetrating resinous smell, and a pungent, bitter taste. It has long been a fancied remedy for the bite of the rattlesnake. It possesses stimulant and tonic properties. It forms an article of export from the United States to Europe, and bears a high price, being highly esteemed as a medicine in certain kinds of fever.—Its reputation as a cure for serpent-bites is shared by other species, particularly *A. anguicida* and *A. quaco* (the Guaco of Colombia), natives of the warmer parts of America. The juice has certainly the power of stupefying, and even of killing serpents; and it is said that a number of species are used by Egyptian jugglers, in order to their handling serpents with impunity.—Several South American species seem also to possess medicinal properties analogous to those of the Virginian snake-root.—*A. Siphon*, a climbing shrub, of 15–20 feet in height, a native of the southern parts of the Alleghany Mountains, is frequently planted in the United States, in Britain, and on the continent of Europe, to form shady bowers.

It has very large heart-shaped leaves (a foot in breadth), of a beautiful green. The flowers hang singly, or in pairs, on long stalks; the tube of the perianth is crooked in its upper part, inflated at the base, and veined with reddish-brown veins, having a sort of resemblance to the bowl of a tobacco-pipe, for

Aristolochia serpentaria:

a, a flower; b, a flower not open, shewing the parts of fructification; c, the stamens; d, the stigmas.

which reason the shrub is sometimes called Pipe-shrub, Pipe-vine, or Dutchman's Pipe.—The tropical species are distinguished for their beauty and the peculiar forms of their flowers. Some of them are much prized ornaments of our hot-houses.

To the natural order *Aristolochiaceæ* belongs also the genus *ASARUM* (q. v.).

ARISTOPHANES, the only writer of the old Greek comedy of whom we possess any entire works, was the son of one Philippus, and was born at Athens about the year 444 B.C. We know very little of his history. Plato, in his *Symposium*, relates that he was fond of pleasure—a statement which it is easy to credit when we consider the tendencies of his profession in all ages. It seems equally clear, however, from the vigorous and consistent expression of his convictions in his various works, and from the fearless manner in which he assails the political vices of his day, that he was possessed of an honest and independent spirit. He appeared as a comic writer in the fourth year of the Peloponnesian war (427 B.C.). The piece which he produced was entitled *Daitaleis* (the Banqueters), and received the second prize. It ridiculed the follies of extravagance, and, like all his subsequent works, was pervaded by a contempt of modern life, and an admiration of the sentiments and manners of the earlier generations. Next year, he wrote the *Babylonians*, in which he satirised Cleon, the so-called demagogue, so sharply, that the latter endeavoured to deprive him of the rights of citizenship, by insinuating that he was not a real Athenian. This, in all probability, gave rise to the various traditions of A. having been born in Rhodes, Egypt, &c. Fragments of these plays remain. In 425, his *Acharnians* obtained the first prize. It was written to expose the madness of the war then waging between Athens and Sparta, and exhibits the feelings of the 'peace-party' in the former city. It is still extant. In 424 appeared *Hippes*, the *Knights* or *Horsemen*. It was the first which the poet produced in his own name, and evinces the singular boldness of the author. It

is levelled against Cleon, and presents us with a striking picture both of a vulgar and insolent charlatan, and of the fickle, cunning, credulous, and rather stupid mob over whom he precariously despotises. It is related of this piece that, when no actor would undertake to play the part of the influential Cleon, A. himself impersonated the demagogue. Unfortunately for the character of Cleon, as well as that of the Athenian democracy, these caricatures and misrepresentations of A. have been received as historical pictures. How far they are from the truth, has been clearly shewn by Grote in his *History of Greece*. See *CLEON*. In 423, A. produced the *Clouds*, which, along with the *Knights*, are the two most famous of his comedies. They exhibit in overflowing richness that fancy, wit, humour, satire, and shrewd insight which characterise this greatest of all Greek comic writers. The *Clouds*, however, displays at the same time the weaknesses and limitations of A.'s mind. Its aim was to deride the pretensions of the new sophistical school, and to point out its pernicious tendencies. So far well. But A., who was no philosopher, demonstrates his own incapacity to appreciate the highest range of thought and character, by selecting no less a person than Socrates as the most perfect representative of a sophist. A., who was both religiously and politically conservative, had apparently no clearer conception of abstract truth than is involved in reverence for the sanctities of the past, the old gods, old traditions, old manners, and old sentiments. He had an instinctive hatred of innovations, and considered all equally pernicious. As he had represented Cleon the reformer as a vulgar innovator and demagogue, ruled by the lowest considerations, he makes the innovating views of Socrates also proceed from corrupt motives, veiled perhaps with more craft. Alcibiades is caricatured in this brilliant comedy as a wildly extravagant youth, whose career of ruin is accelerated by the insidious instructions of Socrates; and a hint is thrown out towards the end of the piece, which unfortunately proved to be the 'shadow' of a 'coming event.' A. represents the father of Alcibiades as about to burn the philosopher and his whole *phrontisterion* (subtlety-shop); and there can be little doubt that this dramatic vilification of the purest of heathen moralists led to that persecution which, twenty years later, culminated in his condemnation and death. In 422 appeared the *Wasps*, still extant, in which the popular courts of justice are attacked: and three years later, in his *Peace*, he returns to the subject of the Peloponnesian war, which is ridiculed with great cleverness. In 414 he produced two comedies, *Amphiarus* and the *Birds*, both of which caricature, in the liveliest manner, the Sicilian expedition, then being meditated, but which proved so utter a failure. The *Lysistrata* belongs to the year 411, and exhibits a civil war of the sexes, as the monstrous issue of that in the Peloponnesus. In his *Plutus* and *Ecclesiazuse*, which respectively appeared in 408 and 392, true to his mission as the enemy of innovation, he assailed the new passion for Doric manners and institutions, and ventured to ridicule Plato, in that, however, in which the philosopher is weakest—namely, his political theory. Euripides, also, as the sophist among poets, is severely handled in the *Frogs*, which belongs to the year 405.

A. wrote fifty-four comedies, of which only eleven are extant. He is acknowledged to stand far above all his contemporaries or successors of the middle and new comedy in wealth of fancy and beauty of language. His choruses sometimes exhibit the purest spirit of poetry; and Plato himself says that the soul of A. was a temple for the Graces. The

ingenuity which he displays in the mechanical artifices of verse is not less wonderful. Frogs are made to croak choruses; pigs to grunt through a series of iambs; and words are coined of amazing length—the *Ecclesiastusæ* closes with one composed of 170 letters. It only remains to be added, what might naturally be expected, that the personalities in which A. indulged descend at times into coarseness and indecency, and that even the gods whom he undertook to defend are treated with levity, and placed in the most ludicrous lights.

The comedies of A. have been edited by Brunck (1781—1783,) Dindorf (1794—1826,) Bekker (1829.) They have all been translated into German by Voss (Brunswick, 1821,) and there are several translations of single plays into English.

ARISTOTELIA. See MACQUI.

ARISTOTLE was born at the Grecian colonial town of Stageira, on the west side of the Strymonic Gulf (now the Gulf of Contessa, in Turkey in Europe), in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nikomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the Great. A. lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stageira. It is to be conjectured that his education, such as it was, would take the direction of preparing him for the family profession, and that whatever knowledge and power of manipulation attached to the practice of physic at that time, would rank among his early acquisitions. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stageira for Athens, then the intellectual centre of Greece and of the civilized world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life, connecting him as political adviser with the two successive Syracusan despots—Dionysius the Elder, and Dionysius the Younger—and with Dion. A., therefore, pursued his studies by books, and by the help of any other masters he could find, during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. The expressions said to have been used by Plato imply as much; for we are told that he spoke of A. as the 'Intellect of the School.' Unfortunately, there is a total absence of particulars or precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing, he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the *Dikasteries*, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that A. would look with contempt upon the shallowness—in all that regarded

thought or subject matter—of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address, being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against A., wrote a treatise wherein allusion was made to a work (now lost) on proverbs, the first recorded publication of the philosopher.

The death of Plato (347 B.C.) was the occasion of A.'s departure from Athens. It was not extraordinary or unreasonable that A. should hope to succeed his master as the chief of his school, named the Academy. We now know that no other man then existing had an equal title to that pre-eminence. Plato, however, left his nephew Spensippus as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined A. to stay no longer in Athens; but there are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip had come into open enmity.

Whatever may be the explanation, he went in his thirty-seventh year, after a stay of nearly twenty years in Athens, to the Mysian town of Atarneus, in Asia Minor, opposite to the island of Lesbos. Here he lived with Hermeias, the chief of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. A. had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher. For three years the two lived together in the stronghold of Atarneus; but by treachery and false promises, the Rhodian Mentor, an officer in the Persian service, got possession of the person of Hermeias, put him to death, and became master of all the places held by him. A. accordingly fled, and took refuge in Mitylene, the chief city of the neighbouring island of Lesbos. He also took with him Pythias, the sister of Hermeias, and made her his wife. In a noble ode, he has commemorated the merits of his friend thus lost to him through the treachery of a Greek renegade. His wife, Pythias, died a few years afterwards in Macedonia, leaving him a daughter of the same name. His son, Nikomachus, to whom he dedicated his chief work on ethics—called, in consequence, the *Nikomachean Ethics*—was born to him at a later period of his life by a concubine.

After two years' stay at Mitylene, he was invited (in the year 342 B.C., age 42) by Philip to Macedonia, to educate his son Alexander, then in his fourteenth year. What course of study Alexander was made to go through, we cannot state. He enjoyed the teaching of A. for at least three years, and contracted a strong attachment to his preceptor, which events afterwards converted into bitter enmity. The two parted finally when Alexander commenced his expedition into Asia (334 B.C.), and A. came from Macedonia to Athens, having recommended to the future conqueror, as a companion in his campaigns, the philosopher Callisthenes, whom he educated along with Alexander. Now at the age of fifty, he entered on the final epoch of his life; he opened a school called the 'Lyceum,' from its proximity to the temple of Apollo Lyceus. From his practice of walking up and down in the garden during his lectures, arose the other name of his school and sect, the *Peripatetic*. It would appear to have been his habit to give a morning lecture to select pupils on the more abstruse subjects, and one in the evening of a more popular kind to a general audience. He may now be supposed to have composed his principal writings; but, unfortunately, there is nothing known of the dates of any of them. This crowning period

of his life lasted twelve years. After the death of Alexander, the anti-Macedonian party at Athens obtained an ascendancy, and among other consequences, an accusation was prepared against A., the pretext being impiety. With the fate of Socrates before his eyes, he chose a timely escape, and in the beginning of 322 B.C., took refuge at Chalcis in Eubœa, where, in the autumn of the same year, he died, aged 62. He had long been afflicted with indigestion, and ultimately sank under this malady.

The *philosophy* of A. differed from that of Plato on many points, especially in the fundamental doctrine termed the Theory of Ideas. The Platonic 'ideas' or 'forms' were conceived as real existences, imparting all that is common to the particular facts or realities, instead of being derived from them by an operation of the mind. Thus, the actual circles of nature derive their mathematical properties from the pre-existing 'idea,' or circle in the abstract; the actual men owe their sameness to the ideal man. A. was opposed to this doctrine throughout, although he always speaks of its author with respect, and sometimes with affection. The whole method of A. was in marked contrast to the Platonic handling of philosophical subjects: he was a most assiduous observer and collector of facts, from which he drew inductions with more or less accuracy. Plato, on the other hand, valued facts merely in criticising the views that he was bent upon demolishing, and not as a means of establishing sound theories.

The writings of A. may be said to have embraced the whole circle of the knowledge of his time. Many of them are lost: those that remain refer principally to the following departments.

Astronomy, Mechanics, Physics, were treated of by him at some length; but here his failure was complete, if we look at his writings from the point of view now acquired. He was the victim of capricious fancies, based upon doctrines common among his contemporaries, accepted by him as principles of reasoning, and conducting him to the most unsound conclusions. His theory of the rotation of the sphere, the necessary perfection of circular motion, of the impossibility of a vacuum, and the like, did more to confuse than to explain the phenomena of nature. Nor can it be said that the time was not ripe for putting these subjects on a rational basis; for he was very shortly followed by a series of men, who both observed and reasoned soundly respecting them, and laid the foundation of their great subsequent progress—namely, Euclid, Apollonius, Archimedes, Eratosthenes, and Hipparchus.

The thirteen books called *Metaphysics* contain much profound thought, but are obscure and defectively arranged; indeed, neither the actual arrangement of the books, nor the title which they bear, can be ascribed to A. himself. The subject to which they are devoted is Ontology—the science of *Ens*, *quatenus Ens*—which he terms *Philosophia Prima*, and sometimes Theology. He distinguishes three branches of theoretical philosophy. 1. Physics—the study of sensible material particular things, each of which differs from every other, and all of which have in themselves the principle of change or motion. 2. Mathematics—that of geometrical and numerical entities, known by general definitions, susceptible neither of change nor of movement, capable of being considered and reasoned upon apart from matter, but not capable of existing apart from matter. 3. The First or Highest Philosophy—which studies the essences of things eternal, unchangeable, and apart from all that change, movement, and differentiation which material embodiment involves.

The *Metaphysics*, or First Philosophy, does, in fact,

deal with the extreme abstractions or generalities of all sciences. It is a collection, partly of doubts and difficulties, partly of attempted solutions, upon these last refinements of the human mind. It includes many valuable comments on the philosophy of Plato and others anterior to or contemporary with A. The general terms and subtle distinctions which this treatise first brought to view, were highly prized throughout all the philosophy of the middle ages.

He appears in a very different light in his great work on Animals. He has here amassed a stock of genuine observations, and also introduced a method of classification, which continues to this day as the most approved groundwork of zoological classification. In this work we see perhaps, in the most advantageous light, the two great qualities of his mind, rarely coupled in the same individual—the aptitude for observation, and logical method. The excellence shewn in his various writings generally depends upon one or other of these qualities.

His *Organon* or Logic is his complete development of formal reasoning, and is the basis and nearly the whole substance of syllogistic or scholastic logic. This science he almost entirely created. Mr. Grote observes (*History of Greece*, part ii. chap. lxviii.) that 'what was begun by Socrates, and improved by Plato, was embodied as a part of a comprehensive system of formal logic by the genius of A.; a system which was not only of extraordinary value in reference to the processes and controversies of its time, but which also, having become insensibly worked into the minds of instructed men, has contributed much to form what is correct in the habits of modern thinking. Though it has now been enlarged and recast by some modern authors (especially by Mr. John Stuart Mill in his admirable *System of Logic*) into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day—we must recollect that the distance between the best modern logic and that of A. is hardly so great as that between A. and those who preceded him by a century—Empedocles, Anaxagoras, and the Pythagoreans; and that the movement in advance of these latter commences with Socrates.'

A considerable portion of his writings relate to the Human Mind and Body. In one of these, a short treatise on Memory and Recollection, he gave the first statement of the laws of Association of Ideas.

His treatises on Rhetoric and Poetics were the earliest development of a Philosophy of Criticism, and still continued to be studied. The same remark is applicable to his elaborate disquisitions on Ethics.

Perhaps one of his greatest works is his Politics, based upon a collection made by himself of 158 different Constitutions of States; the collection itself being unhappily lost. Here we see the spirit of the inductive observer, which indeed is no less apparent in the works mentioned in the last paragraph. It is, however, a singular fact, that he gives no evidence of having read the historian Thucydides; and his only reference to Herodotus is on a point of natural history. Yet the narratives and descriptions contained in the works of both these writers are probably of as much value, and as much in point, in a Political Philosophy, as the very best observations made by himself.

The great current distinctions of Matter and Form, Substance and Quality, Actuality and Potentiality, are due to A.

ARISTOXENUS, of Tarentum, a pupil of Aristotle's, and one of the oldest writers upon music, flourished about 330 years B.C. He was extraordinarily active and versatile in his literary studies, and is said to have composed upwards of 450 treatises

on music, history, and philosophy. On the death of Aristotle, he fully expected to be appointed his successor, and is said to have been deeply mortified when Theophrastus was preferred; but this statement is discredited by many. He founded a school of musicians, who were called after him, Aristoxeneans, and whose distinguishing characteristic was that they judged of the notes in the diatonic scale exclusively by the ear, while the Pythagoreans determined these mathematically. Except his *Elements of Harmony*, in three books, which we still possess, only a few fragments of his writings survive in later authors.

ARITHMETIC is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term A. to this art of reckoning, assigning the investigation of the principles to analysis.

Among the ancient Greeks and Romans, A. made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid (7—10 B. of the *Elements*), Archimedes, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th c., A. began to assume a new form; but it was not till the 16th c. that the Double Rule of Three, or Compound Proportion, was discovered, and decimal fractions were introduced. The invention of Logarithms in the 17th c. is the last great step in advance that the art has made. Passing over the elementary operations of Addition, &c., the chief heads, such as FRACTIONS, DECIMALS, PROPORTION, LOGARITHMS, &c., will be noticed in their proper places.

ARITHMETICAL MEAN is that number that lies equally distant between two others: thus, the A.M. between 11 and 17 is 14, which is found by taking half their sum.

ARITHMETICAL PROGRESSION is a series of numbers that increase or diminish by a common difference, as 7, 10, 13, 16, 19, 22; or 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, &c., form an A. P., of which the difference is 1.

ARITHMETICAL SIGNS are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. *Ex. gr.*, 7 + indicates that 7 and 5 are to be added together; 7 — 5, that 5 is to be subtracted from 7; 7⁵ that 7 is to be raised to the fifth power; 7 ÷ 5 = 15 — 3, that when 7 and 5 are added together, the result is equal to the difference between 15 and 3. The same signs are also used in Algebra; and an enumeration and explanation of them may be found in almost any treatise on Arithmetic or Algebra.

ARIUS, the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been born shortly after the middle of the 3d c. About the year 306 A.D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these A. was largely mixed up. At first, he took part with Meletius, Bishop of Lycopolis, in Upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, Bishop of Alexandria; but afterwards he became reconciled to the latter, who made A. a deacon. The reconciliation, however, was brief. A. once more took the part of Meletius, and was

excommunicated by Peter in consequence; but the latter dying soon after, Achillas, his successor, restored A. to his office, and even advanced him to the dignity of a presbyter, 313 A.D. His new function required that he should interpret the Scriptures, and, as he possessed an abundance of natural gifts, united with great learning, it is not wonderful that his preaching should have become popular, and his peculiarities of opinion been vehemently embraced. The first time, however, that A. was brought into collision on a point of doctrine with his ecclesiastical superiors, was in 318 A.D. Alexander, Bishop of Alexandria, and successor of Achillas, having in a public assembly of clergy, while speaking of the Trinity, said that it contained one single essence, or indivisible unity of substance, A. alleged that such a conception was impossible to the human mind, and accused Alexander of Sabellianism—i. e., of destroying the distinction of persons. The dispute grew hot, and a conference which was held to settle it only embittered the disputants. In maintaining his ground, A. went beyond his first statement of the absolute distinctness of person between the Father and the Son; he maintained that the Son was not co-equal or co-eternal with the Father, but only the first and highest of all finite beings, created out of nothing by an act of God's free will, and that he ought not to be ranked with the Father.

A. was successful in securing the adherence of large numbers both of the clergy and laity in Egypt, Syria, and Asia Minor. In 321 a synod of bishops was held at Alexandria. These deposed and excommunicated A., and active measures were taken to let this decision be known over all the Christian churches; Alexander himself wrote numerous letters (two of which are still extant), exhorting the bishops not to receive the 'heretic.' In consequence of these violent steps, the breach was widened between both parties. To escape persecution, A. retired to Palestine, where he wrote a letter to his friend Eusebius, who was bishop of Nicomedeia, a city of Bithynia, and not far from Constantinople. Eusebius, one of the most influential Christians of his time, warmly sympathized with him; wrote in his behalf to Paulinus, Bishop of Tyre, and others; absolved him from the Alexandrian synod's excommunication; and in 323 convened another synod in Bithynia, which pronounced favourably on A. He even enlisted Constantine on the side of the latter, to this extent at least, that the half-pagan emperor addressed admonitions to both Alexander and A., assuring them that the point in dispute was a trifling one, and ought not to provoke a serious quarrel. While A. was residing at Nicomedeia, he wrote a theological work in verse and prose, called *Thaleia*, some fragments of which remain, and indicate an earnest and philosophic mind, but at the same time contain expressions which could not but pain a believer in the divinity of Christ. The *Thaleia* is said to have been sung by the Arian neophyte, who thus kindled the passions of their adversaries, and increased the virulence of the contest. The comedians, who were pagans, took advantage of the occasion to ridicule the Christian religion in the theatres. The officers of the emperor in several cities wished to repress this profane temerity, but the interference only created greater confusion.

It now became impossible for the emperor to remain neutral or indifferent, with safety to himself, or to the tranquillity of the empire. Hosius, Bishop of Corduba, whom he had appointed mediator betwixt Alexander and A., took part with the former, and reported unfavourably of A. The result was, that Constantine, in order, as he thought, to effect a final settlement of the question, convoked the memorable Council of Nicæa (Nice, q. v.), in

Bithynia, 325 A.D. Three hundred and eighteen bishops from almost all parts of the Christian world, but especially from the east, were present, besides numbers of priests, deacons, and acolytes. A. boldly expounded and defended his opinions. He declared in the most unambiguous manner that the Son of God was created out of nothing; that he had not always existed; that he was not immutable or impeccable; that it was through his free-will he remained good and holy; that if he had chosen, he could as easily have sinned as not; in a word, that he was a mere creature and work of the Deity. He further affirmed that the Son of God was not of the same substance with the Father; that he was not the 'Word' or 'Wisdom,' properly speaking; and that the Scriptures only attribute these names to him as they do to other created intelligences. These propositions were listened to with great calmness by the bishops, but the inferior clergy, or at least a majority of them, manifested the most violent opposition. The document containing his confession of faith was torn to pieces before his face. Arguments, however, of a more rational kind were also employed. Alexander was ably seconded by the young deacon, Athanasius, the equal of A. in eloquence, and in the power of his logic. It was principally by the reasonings of Athanasius that the Council was persuaded to define, in the most precise manner, the doctrine of the Godhead—viz., the absolute unity of the divine essence, and the absolute equality of the three persons. All the bishops subscribed it except two, Theonas of Marmarica, and Secundus of Ptolemais, who had the heroism (for it must be considered such) to follow the banished A. into Illyricum.

An imperial edict was now issued commanding the writings of A. to be burned, and threatening with capital punishment all who should be convicted of concealing them. This change in the emperor's sentiments as to the importance of the doctrine at issue is attributed by some writers to his recognising the will of Heaven in the harmonious consent of so many bishops. A more probable explanation is, that he anticipated the utmost social confusion from the collision of opinions, and resolved to crush that which was at once the youngest and the weakest, hoping thereby to remove the ground of disturbance. He was mistaken, however. At Alexandria, the Arians continued in a state of open insurrection, and began to league themselves with other condemned sects, for the purposes of mutual defence. The great influence of Eusebius was also exerted on behalf of the exiled heretic, as well as that of Constantia, the sister of the Emperor, who had herself embraced Arian tenets, and in 328, permission was granted him to return from Illyricum. Constantine was very gracious, perhaps because he thought the chances of peace being restored to the community were now greater, for it had been represented to him by Eusebius that the doctrines of A. did not essentially differ from those of the Nicene Council. In 330 A.D., A. had an interview with the emperor, and succeeded in convincing him that Eusebius had only spoken the truth. In the confession of faith which he presented, he declared his belief that the Son was born of the Father before all ages, and that as the 'Word,' he had made all things both in heaven and earth. The emperor was satisfied, and sent orders to Athanasius, now Bishop of Alexandria, to receive A. into the communion of the church. This Athanasius refused to do, and a series of tumults was the consequence. Eusebius was greatly irritated. He called a synod of bishops at Tyre, in 335 A.D., which proceeded to depose Athanasius. The emperor was even prevailed on to remove the latter to Gaul, though he alleged as his reason, that he wished to deliver him

from the machinations of his enemies. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against A. and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius, and resolutely resisted every effort to establish the new opinions among them. Disappointed in his expectations, A., in 336 A.D., proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to Arius the holy communion on the Sunday following. This was considered a grand triumph by Eusebius and his friends, and when the day arrived, they escorted A., as a guard of honour, through the streets of the metropolis. When about to enter the temple in which it was intended that he should be received with solemn pomp, he retired a moment to relieve nature, but fainted, and died of a violent hemorrhage. His disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

A. was exceedingly handsome, but the harassing cares of a life spent in a continual struggle with his adversaries, is said to have given him a worn and haggard look. His manners were graceful and modest; he was noted for even an ascetic abstinence, and the purity of his moral character was never challenged by a single enemy. A. is said to have composed songs for sailors, millers, and travellers, in popular measures, for the purpose of spreading his peculiar tenets; but no traces of these survive.

After the death of A., his followers rallied round Eusebius, now Bishop of Constantinople (338), from whom they were styled Eusebians. The reconciliatory middle party of Eusebius of Cæsarea (died 340 A.D.), who wished to end the great controversy by abstaining from all strict dogmatic assertions on the matter, soon dwindled into insignificance between the two contending parties. Constans, who ruled the West after the death of Constantine (337), and Constantius, in the East, made an essay towards reconciliation; but it failed at the synod of Sardis (347), where the occidental bishops gathered themselves round Athanasius in support of the *Homoousian* doctrine (identity or sameness of substance), while in a separate council at Philippopolis, the oriental bishops asserted the *Homoiousian* doctrine (implying merely similarity of substance). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having, by the death of Constans (350) and conquest over Magnentius (353), gained dominion over the west, the Arian cause, which he favoured, triumphed at the synod of Arles or Arles (353) and at that of Milan (355.) These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antiniceans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomœoi, or Heterousians, asserted, in the boldest style, their doctrine of 'distinct substances.' The semi-Arians (a large majority in the Eastern Church) maintained the *Homoiousian* doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the apostate (361—362), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the west, Valentinianus I., Gratianus, and Valentinianus II.,

extended full toleration to both parties. Arianism, at last, was virtually abolished in the Roman empire, under Theodosius in the east (379—395), and Valentinian II. in the west. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Mæso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Sævi in Spain, and the Longobards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Longobards, who retained the Arian creed until 662. The Arian controversy has never excited any great interest in modern times, though in England it was revived for a time by the writings of the learned Dr Samuel Clarke (1675—1729), and also by Whiston, who died in 1752. More recently, a part of the Arian doctrine, the denial of 'the eternal sonship,' was broached in the Wesleyan Methodist Society by Dr Adam Clarke and a few followers; but it was soon suppressed by the Conference. Pure Arianism can hardly now be said to exist. It has gradually lapsed into Unitarianism (q. v.); see also SOCINIANISM.

ARKANSAS, one of the larger states of the American Union, taking its name from the river A. Throughout its entire length, it occupies the right bank of the Mississippi, being separated by that stream, towards the east, from Tennessee and the north half of Mississippi. Its boundaries to the south, west, and north are purely arbitrary and conventional, and are best learned from a map. With a length of 240 miles, and a breadth of 224, the area of A. is 52,198 square miles, being pretty nearly the same as that of England proper. In 1860, out of the equivalent 33,406,720 acres, only 1,983,313 were cultivated—very little more than $\frac{1}{7}$ of the whole, or than $\frac{1}{2}$ of the lands liable to taxation as being allotted and occupied. Arkansas had in 1820, 14,273 inhabitants; 30,388 in 1830; 97,574 in 1840; 209,877 in 1850; in 1860, 435,450, of whom 324,143 were whites, 144 free colored, 111,115 slaves, and 48 Indians. Though nominally colonized by the French in 1685, yet in 1803 it was still virtually a wilderness, when, as a portion of Louisiana, it came by purchase into the possession of the United States, while it was only in 1819 and 1836 respectively that it became first a territory, and then a state of the Union. The towns of Arkansas are small, the principal being Little Rock, which is the seat of government, with 3727 inhabitants, Camden with 2219, Fort Smith with 1530, Pine Bluff with 1396, Van Buren with 969, and Arkadelphia with 817.

In climate and productions A. occupies, as it were, an intermediate position between the states of the west and those of the south. A. is rich in minerals, particularly in manganese, zinc, and gypsum. It also contains the principal varieties of coal—canal, anthracite, and bituminous. It likewise possesses lead-ores, which are said to contain a large proportion of silver. The manufactures of the state are comparatively insignificant.

The internal improvements of A. are confined chiefly to plank roads and levees or embankments against the Mississippi. Of a projected railway of 155 miles from Little Rock to Memphis in Tennessee, only 29 miles appear to have been actually completed. In fact, the state is comparatively independent of works of this description, penetrated as it is by so many navigable rivers—the A., the White River, the St Francis, the Red River, the Washita, &c.

On 1st October 1858, the public debt of A., contracted mainly in support of banks, amounted to 3,138,972 dollars, nearly half of it representing 'interest accrued and unpaid.' The revenue for the preceding two years was 945,884 dollars, being generally the result of a direct assessment on property of almost every description—lands, houses, furniture, horses, mules, cattle, stock-in-trade of all trades, gold watches, jewellery, &c.

The state legislature meets only once in two years. To the Lower House of Congress, A., in the proportion of its population, sends two representatives; while, like every other state, it has two senators in the Upper House.

ARKANSAS RIVER, next to the Missouri the largest affluent of the Mississippi. It is 2000 miles long, rising in the Rocky Mountains on the borders of Utah, and joining the 'Father of Waters' in lat. 33° 54' N., and long. 91° 10' W. Flowing generally through a level country, it presents but few obstacles to navigation. The principal difficulty is connected with its periodical rise and fall—the difference between season and season being not less than 25 feet. Notwithstanding this, however, the A. is practicable for steamboats during nine months of the year, to a distance of 800 miles from its mouth. It divides the state which takes its name into nearly equal parts, varying in breadth within the limits of the same from 3 furlongs to half a mile. Its banks also, in its lower course, contain a good deal of stone-coal.

ARKLOW, a seaport town in the south-east corner of Wicklow county, in lat. 43° 40' N., and long. 4° 38' W., at the mouth of the river Avoca, which is crossed here by a bridge of nineteen arches. It consists of an upper well-built town, and a lower, inhabited by fishermen. 200 boats are employed in the herring and oyster fishery. Near the town is Shelton Abbey, the seat of the Earl of Wicklow. Sand-banks unfit the harbour for ships of any size, and extensive sand-dunes exist on the adjacent coast. In 1798, a bloody encounter took place here between the royal troops and the United Irishmen. Pop. 4760.

ARK OF THE COVENANT, ARK OF THE TESTIMONY, or ARK OF JEHOVAH, one of the most important parts of the furniture of the tabernacle, which, by divine direction, the Israelites constructed in the wilderness, and afterwards of the temple built by Solomon at Jerusalem. A description of it is to be found in Exodus xxv., in the command given to Moses for its construction; and also in Exodus xxxvii., from which it appears that it was a chest of shittim-wood (very generally supposed to be the wood of a species of acacia, but by some regarded as more probably that of the wild-olive), overlaid with gold within and without, two cubits and a half in length, one cubit and a half in breadth and in height—that is, according to the common estimate of the length of the cubit, 3 feet 9 inches in length, and 2 feet 3 inches in breadth and height—the lid being formed entirely of pure gold, with a crown or raised border of gold round about. Within the ark was deposited the 'testimony,' consisting of 'the two tables of the law,' i.e., the stone tablets upon which the ten commandments were inscribed. The golden lid of the ark was called the *mercy-seat* or *propitiatory*, and above it were the *cherubims* (q. v.), made of the same piece of gold with it, and between them was the place of the *Shechinah* or manifestation of the Divine presence. The ark had also golden rings, through which passed staves of shittim-wood, overlaid with gold, for carrying it in the journeyings of the Israelites, concerning which very particular rules were laid down (see

Numbers, iv.). Whilst being carried from one place to another, it was covered first with a 'covering of badgers' skins,' and above this with 'a cloth wholly of blue;' and in the tabernacle and temple it was put into the 'most holy place,' into which the high-priest alone was to enter upon the 'day of atonement.' The ark was called the A. of the C., because it was the appointed symbol of the presence of God as the God of Israel, and of his covenant with his people. The things of the Jewish dispensation being regarded as typical, and the Jewish religion as essentially one with the Christian, the ark is commonly regarded as a type of Christ; the excellency and unchangeableness of the moral law, as indicated by the place assigned to it within the ark, which, however, sprinkled with the blood of typical sacrifice, was interposed between it and men, who, having transgressed it, were exposed to its curse; and the mercy-seat, in like manner sprinkled with the blood of sacrifice, was interposed, as it were, between the law and God, who is represented in the Old Testament as 'dwelling between the cherubims,' and thence shining forth as the God of mercy, favourable to his worshippers. A complete harmony is thus made out between these Old-Testament types and Christian theology.—It is worthy also of notice, that sacred arks or chests have been connected with the worship of various heathen nations, and have been placed as the most sacred things in the innermost parts of the temple, which only the priests were permitted to enter. The relation of these to the ark of the Jews has been the subject of much learned inquiry, but has not yet received thorough and satisfactory elucidation.—The ark appears not to have been brought back from Babylon, and so never to have been in the second temple. No figure of it appears among the sacred vessels of the temple represented on the Arch of Titus.

ARKONA, the north-east promontory of the island of Rügen, in the Baltic, almost the most northern extremity of Germany. Its steep cliffs mainly consist of mixed chalk and loam, with horizontal veins of flint; there is a small deposit of pure chalk towards the east. Myriads of sand-martins build in the clefts of these cliffs. The view from their summit extends to the coast of Jasmund on the right, on the left to the islands of Hiddensöe and Möen. The name A. is very ancient. In the chronicles of Saxo Grammaticus we find it written Archona, but its derivation is quite uncertain. On the west side is the famous wall or fortified enclosure in which stood the temple of the Wend deity Swantewit. King Waldemar I. of Denmark, after a bloody conflict, took possession of the fortress in 1168, burnt the idol and its temple, and carried away its treasures to Denmark. On its site, a lighthouse, 75 feet high, was built in 1827.

ARKWRIGHT, SIR RICHARD, celebrated for his inventions in cotton-spinning, was born at Preston, in Lancashire, December 23, 1732. Of humble origin, the youngest of thirteen children, and bred to the trade of a barber, his early opportunities of cultivation were exceedingly limited. In 1760, he gave up his business as a barber, and became a dealer in hair. A secret process for dyeing hair, said to have been discovered by himself, increased considerably the profits of his trade. Very little is known regarding the first movements of his mind in the direction of mechanical invention. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the processes used in that manufacture. That the development of his mechanical ingenuity was not, however, due to circumstances, is sufficiently proved by the fact, that his first effort

was an attempt to discover the perpetual motion. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767, he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton-thread of sufficient tenuity and strength to be used as warp. An invention, indeed, by Mr. Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives A. of the honour of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said, was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time A. was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a Burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr. Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who entered into partnership with him, in conjunction with his partner Mr. Need. In 1769 A. set up his first mill, driven by horses, and took out a patent for his invention. In 1771 he set up a larger factory, with water-power, at Cromford, in Derbyshire. The remarkable capabilities of his mind were strikingly evinced in the management of the great business which now demanded his undivided attention. Without personal experience, and with no model to guide him, he introduced a system of management so admirable that it was afterwards universally adopted, and has never been materially improved. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action against Colonel Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, A. published a pamphlet containing a statement of his case. In a new trial, in 1785, he obtained a favourable verdict. The whole question, however, was brought finally before the Court of King's Bench, a few months after, when A.'s claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of A.'s old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out A. as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against the man who abridged labour, but in reality increased its sphere; and on one occasion, a large factory belonging to A. was destroyed in the presence of a powerful military and police force,

without a word of interference from the magistrates. The energy and good sense of A., however, triumphed over all opposition; and at the time of his death, in 1792, the value of his property amounted to about half a million sterling. In 1786 he was appointed high-sheriff of Derbyshire; and on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he received the well-merited honour of knighthood. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated his honourable career at the comparatively early age of sixty.

ARLES (anciently, Arelate), one of the oldest towns in France, situated on the left bank of the principal branch of the Rhone, after it has divided into a delta, in the department of Bouches du Rhone. Population of the municipality, 25,543; of the town, 14,750. A. carries on a considerable trade. It has manufactures of silk, hats, tobacco, brandy, &c., and forms a market for the productions of the surrounding country. It also possesses a college, a naval school, a public library, and a superb museum of antiquities in natural history. The marshes which rendered the district so unhealthy for a long time, have been considerably drained, and a canal has been formed which connects it with the south coast. Railways also bring it into easy communication with Marseille, Avignon, Nimes, Montpellier, &c. Under the Romans, it was the seat of a prefect; afterwards, for some time, the residence of the Gothic king, Eurich; and, in 879, was the metropolis of the kingdom of Arelate (see BURGUNDY). In the early Christian times, several important synods were convened here (314, 354, 452, and 475 A.D.). Among the antiquities of A. are a magnificent amphitheatre, which could contain between 20,000 and 30,000 spectators; the ruins of the theatre, also of a palace of Constantine the Great; an obelisk of granite, dug up from the mud of the Rhone in 1389; a burial-place (the Elysian Fields) used by the Romans; and a medieval cathedral, in the old Roman style, with a splendid portal arch.

ARM, the upper extremity of the human body, consists of two portions—the A., strictly so called, and the forearm; the former having one bone, the

Bones of the Human Arm.

humerus (1), which moves freely by a globular head upon the scapula, forming the shoulder-joint; and the latter having two bones, the radius (3) and ulna (2), which move on the lower end of the humerus, forming the elbow-joint, and below, with the carpus, forming the wrist.

The humerus is attached by a loose capsular ligament to the scapula, allowing great freedom of motion; and were it not for the muscles passing into I and K, would be frequently dislocated, but it is supported by these muscles on all sides except underneath or opposite the armpit (q. v.) into which the head of the bone is often driven. The roundness of the shoulder is due to the head of the humerus, so that any displacement is accompanied by a flattening, which at once suggests the nature

of the accident. On the shoulder is a large triangular muscle, the deltoid, which lifts the A. from the side. At the back is the triceps, which extends the forearm; in front are two muscles which flex or bend it—the biceps, and the brachialis anticus; and on each side below are muscles passing to the forearm and hand; while on each side above, the great muscle of the back (latissimus dorsi) and that of the chest (the pectoralis major) are inserted on each side of the groove, wherein lies one of the tendons of the biceps (q. v.). The motions of the ulna are flexion or bending effected by the biceps, and extension or straightening by the brachialis anticus and the triceps, its projections D and A being received in these movements into corresponding depressions on the humerus. The movements of the hand are principally due to the radius, the head of which rolls at C and H upon the ulna at F and L, thereby turning the palm downwards (pronation), or restoring the palm upwards (supination), these

Human Arm:

abc, deltoid muscle; d, coraco brachialis muscle; r, r, triceps; e, i, extensors of wrist and long supinator of the hand; km, flexor of fingers and radial and ulnar sides of the wrist, and l, palm of the hand, or palmaris longus; 2, palmaris brevis; g, palmar fascia; o, biceps.

movements being effected by muscles, two for each movement, which taking their fixed points from the humerus and ulna, pull the radius round on the latter. The elbow-joint is ginglymoid or hinge-like, and therefore has strong lateral ligaments; but it is extremely liable to dislocations, often accompanied by fracture, especially in the young. The accident being followed by severe inflammation, the joint is very apt to stiffen, thereby seriously (see ANKYLOSIS) deteriorating from the usefulness of the limb; it is, therefore, inadvisable to keep the limb too long in any one position after such an injury. This joint is also very liable to disease; but as this is confined to the ends of the bones, the small portions of the latter affected can be readily cut out, and the arm be restored to usefulness and mobility in a few weeks.

The upper extremity is supplied with blood by

the brachial artery, the continuation of the axillary trunk. The veins collect into large superficial trunks, which unite at the bend of the elbow, at which situation one is frequently selected for venesection, and then pass on to the axillary, on the outside by the cephalic vein, on the inner side by the basilic.

The nerves pass down as large cords by the side of the artery, and diverge from it to their ultimate distributions; the musculo-spiral soon passing round at the back to appear on the outside, and become the radial and posterior interosseous nerves; the ulnar running behind the internal condyle, N, for which it has obtained the term 'funny bone,' from the electric-like thrill which passes along the arm when the nerve is struck or pressed. The median, as its name implies, keeps a middle course with the artery.

In wounds of the forearm, the bleeding is often excessive, but may be at once controlled by pressure on the brachial artery, on the inner side of the biceps.

The arm affords excellent illustrations of some of the principles of mechanics. The insertion of the muscles so near, as will be seen, to the fulcra or centres of motion, involves a loss of power in the usual sense of the word; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put, agility is of far greater moment than dead strength.

ARM. In maritime language, besides the obvious application to weapons of warfare, this term is applied to each extremity of a bibb, or bracket, attached to the mast of a ship for supporting the trestle-trees. The same name is also given to a part of the anchor. See **ANCHOR**.—In military language, the infantry, the cavalry, the artillery, and the engineers are each called 'an A.' of the service—equivalent to branch or department.

ARMADA, a Spanish word signifying simply an armed force, but applied specially to the great Spanish fleet which invaded England in 1588. The king of Spain, Philip II., had resolved to strike a decisive blow at the Protestant interest, by conquering England, which Pope Sixtus V. had made over to him. The ports of Spain, Portugal, and other maritime dominions belonging to him, had long resounded with the noise of his preparations, and the most eminent Catholic soldiers from all parts of Europe flocked to take a share in the expedition. The Marquis of Santa-Croce, a sea-officer of great reputation and experience, was destined to command the fleet, which consisted of a hundred and thirty vessels, of greater size than any that had been hitherto seen in Europe. The Duke of Parma was to conduct the land-forces, 20,000 of whom were on board the ships of war, and 34,000 more were assembled in the Netherlands, ready to be transported into England; so that, as no doubt was entertained of success, the fleet was ostentatiously styled the *Invincible A.* Nothing could exceed the terror and consternation which seized all ranks of people in England upon the news of this terrible *A.* being under sail to invade them. A squadron of not more than thirty ships of the line, and those very small in comparison, was all that Elizabeth had to oppose it by sea; and it was considered impossible to make any effectual resistance by land, as the Spanish army was composed of men well disciplined and long inured to danger. But although the English fleet was much inferior in number and size of shipping to that of the enemy, it was much more manageable, while the dexterity and courage of the mariners were greatly superior. Lord Howard of Effingham, a man of great valour and capacity, took upon him, as lord high admiral, the command of the navy; Drake, Hawkins, and

Frobisher, the most renowned seamen in Europe, served under him; while another squadron, consisting of forty vessels, English and Flemish, commanded by Lord Seymour, lay off Dunkirk, in order to intercept the Duke of Parma. Such was the preparation made by the English; while all the Protestant powers of Europe regarded this enterprise as the critical event which was to decide for ever the fate of their religion. In the meantime, while the Spanish *A.* was preparing to sail, the admiral, Santa-Croce, died, as likewise the vice-admiral, Paliano; and the command of the expedition was given to the Duke of Medina Sidonia, a person utterly inexperienced in sea affairs; these unexpected circumstances served, in some measure, to frustrate the design. Some other accidents also contributed to its failure. Upon leaving the port of Lisbon, the *A.* next day met with a violent tempest, which sank some of the smallest of the ships, and obliged the rest to put back into the harbour. After some time spent in refitting, the Spaniards again put to sea, where they took a fisherman, who gave them intelligence that the English fleet, hearing of the dispersion of the *A.* in a storm, had returned to Plymouth, and that most of the mariners were discharged. From this false intelligence, the Spanish admiral, instead of going to the coast of Flanders, to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping laid up in the harbour. But Effingham was very well prepared to receive him, and had just got out of port, when he saw the Spanish *A.* coming full sail towards him, disposed in the form of a half-moon, and stretching seven miles from the one extremity to the other. The English admiral, seconded by Drake, Hawkins, and Frobisher, attacked the Spaniards at a distance, pouring in their broadsides with admirable dexterity. They did not choose to engage the enemy more closely, because they were greatly inferior in number of ships and guns, as well as in weight of metal; nor could they pretend to board such lofty vessels without manifest disadvantage. In this action, however, two Spanish galleons were disabled and taken. As the *A.* advanced up the Channel, the English still followed and infested its rear; and as their ships continually increased from different ports, they soon found themselves in a capacity to attack the Spanish fleet more nearly, and accordingly fell upon them while they were taking shelter in the port of Calais. To increase their confusion, Howard selected eight of his smaller vessels, which, after filling them with combustible materials, he sent one after another, as if they had been fire-ships, into the midst of the enemy. The Spaniards, taking them for what they seemed to be, immediately bore off in great disorder; while the English, profiting by their panic, captured or destroyed about twelve ships. The Duke of Medina Sidonia being thus driven to the coast of Zealand, held a council of war, in which it was resolved, that, as their ammunition began to fail, as their fleet had received great damage, and as the Duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, as the winds were contrary to their passage directly back. Accordingly, they proceeded northward, and were followed by the English fleet as far as Flamborough Head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were afterwards cast away on the Western Isles and the coast of Ireland. Of the whole *A.*, fifty-three ships only returned to Spain, and these in a wretched condition. The seamen, as well as the soldiers who remained, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate

valour of the English, and of the tempestuous violence of that ocean by which they were surrounded.

ARMADILLO (*Dasypus*), a genus of mammalia of the order *Edentata* (i. e., toothless)—not, however, truly toothless, but having feeble teeth destitute of true roots, and set apart from each other, and so that those of the one jaw fit into the interstices of those of the other. The number of the teeth is different in different species. The muzzle is elongated, and the tongue smooth and slender, with a glutinous saliva, adapted to the capture of ants and other insects, after the manner of the ant-eaters, but not long and extensile, like theirs. The limbs are short and strong, as are also the claws, and the animals have a great aptitude for digging and burrowing, by means of which they seek to shelter themselves from enemies—burrowing in sand or soft earth with such rapidity that it is almost impossible to dig them out, and indeed it can only be done by persevering till they are exhausted. But that which peculiarly distinguishes the A., and in which this genus differs from all the other mammalia, except the *Chlamyphorus* (q. v.), is the bony armour with which the body is covered, and which consists of polygonal plates not articulated, united on the head to form a solid covering, and similarly to form solid bucklers over the shoulders and the haunches; and between

Armadillo.

these, disposed in transverse bands, which allow of freedom of motion to the body, similar bands in most species protecting also the tail. Armadillos feed not only on insects, but on vegetable and animal food of almost every kind, which by decomposition or otherwise has acquired a sufficient softness. Some of them prefer vegetable food, others delight chiefly in carrion. They are all natives of the warm and temperate parts of South America, in the woods and pampas of which they are found in immense numbers. They are timid and inoffensive, although, when they are incautiously assailed, injury may be received from their claws. Their flesh is esteemed a delicacy, particularly that of the species which feed chiefly on vegetable food. The largest species is fully three feet long, exclusive of the tail; the smallest, not above ten inches. The species are numerous, and the genus has been divided into a number of subgenera, which some naturalists elevate into genera, naming the family *Loricata* (i. e., mailed). To this family belongs also the genus *Chlamyphorus*, also South American. Fossil remains of gigantic extinct armadillos have been found in the pleistocene strata of South America, forming the genus *Glyptodon* of Owen, so named from the fluted teeth.

ARMADILLO is also the scientific name of a genus of *Crustacea* of the order *Isopoda* of Cuvier. This is one of the genera usually included under the popular name of Woodlouse, and one of which (*Porcellio*) is very generally known by that of Slater. The armadillos derive their name from the

scaly armour of their body, in which an analogy is found to the mailed quadrupeds of South America. They have, in a remarkable degree, the power of rolling themselves into a ball, when alarmed, so as to expose nothing but the plates of the back, and have thence received the name of Pill Beetles. Like some of the other closely allied *Isopoda*, they were at one time reputed to possess medicinal virtues, now accounted merely imaginary. They were not only used in a dried and pulverised state, but they are said to have been actually swallowed entire as pills.

A. vulgaris is not uncommon in damp places, under stones, &c., in Britain.

ARMAGH, a small inland county in Ulster, Ireland; bounded N. by Lough Neagh, E. by Down, S. by Louth, W. by Monaghan and Tyrone. Its greatest length is 32 miles, and breadth 20. It is the 27th in size of the Irish counties; area, 512½ square miles, about four-fifths being arable, and a 36th part in woods. The surface is hilly in the south, and undulating in the centre, attaining in Slieve Gullion, in the south-west, the height of 1893 feet. The other chief heights are the Newry Mountains, 1385 feet; the Armagh-breague Hills, 1200; and Mullyash, 1034. The country bordering upon Lough Neagh is low and boggy, and the Louth plain extends into the south end of A. The principal rivers, navigable in their lower parts, are the Upper Bann, flowing out of Down north-west for 11 miles before it enters Lough Neagh; and the Blackwater, which, in its lower part, separates A. from Monaghan. The rocks of A. are—Lower Silurian in the south and middle of the county; the trap of Antrim, with the underlying greensand, around Portadown; carboniferous limestone in the basins of the Blackwater, and its tributary the Callan; granite in the mountains of the south-east; and tertiary strata bordering Lough Neagh. The soil is fertile except in the southern extremities. In 1858, 179,598 acres—nearly half the county—were in crop, the principal crops being oats, potatoes, wheat and flax. The stock in that year was 13,943 horses, 72,176 cattle, 8043 sheep, 21,647 pigs. The north and central parts of A. exhibit a dense population, low hills cultivated to the tops, hedgerows, orchards, and thickly scattered farmsteadings. Pop. in 1861 190,086, shewing a decrease of 6702 in ten years. The county is mostly in the diocese of Armagh, and contains 28 parishes and parts of parishes. It returns three members of parliament—two for the county, and one for the city. The chief towns are A., Lurgan, Portadown, and Newry.

ARMAGH, the capital of the county of A., in a carboniferous limestone district, in the north-west of the county. It is situated round the base and on the slopes of a gentle eminence, hence its original name, Ard-Magha, 'the high field.' It is well built, of limestone. The only edifice of other material is the cathedral, which is built of red sandstone, and is cruciform—184 by 119 feet—crowning the central eminence, and is supposed to occupy the site of that erected by St. Patrick in the 5th c. It has recently been repaired and beautified, chiefly at the cost (£10,000) of the present Lord Primate, Lord Beresford. Lesser eminences rise on the north-east and south of A. A new Gothic Roman Catholic cathedral occupies the principal height to the north, and the primatial palace that to the south. There is a fever hospital for forty patients, maintained by the present primate, and a lunatic asylum for four counties. A. is the seat of the Archbishop of all Ireland, who has an income of £12,087 a year. Pop. of the town in 1861, 8969. A. returns one member to parliament.

Armadillo.

The chief manufacture is linen-weaving. A., from the year 495 to the 9th c., was the metropolis of Ireland, the native kings living at Eamania, 2 miles to the west of the city. It was then renowned as a school of theology and literature—its college being the first in Europe. After the Reformation, it suffered severely in the conflicts between the English and Irish; and it contained only three slated houses in 1765.

ARMAGNAC (*Ager Armonicus*), the old name of a district in the south of France, which at one time seems to have extended from the valleys of the Pyrenees to the Garonne. It is now included in the departments of Hautes Pyrénées and Gers. The remarkably fertile land, producing grain and the best descriptions of wine, and also favourable for pasturage, is cut up into an extraordinary number of small estates, and divided among numerous petty proprietors. The principal branch of trade is the distillation of the brandy known in commerce as *Eau d'Armagnac*, which rivals those of Cognac and Saintonge. The ancient capital is Lectoure, on the river Gers, with 2879 inhabitants. To the south of it lies Auch, the chief town of the department of Gers. Pop. 7942. The people are noted for their simplicity, strength, and bravery; but, on the other hand, they are extremely credulous and ignorant. Formerly, their services were highly valued in times of war. The A. family, descended from the old Merovingian king, Clovis, played an important part in French history.

ARMAMENT is a general name for the weapons of war employed in sea and land battles; all the weapons collectively being called *the A.* of a ship or an army.

ARMANSPERG, JOS. LUDW., COUNT OF, formerly president of the government in Greece, was born in Lower Bavaria in 1787, and early embraced an administrative and diplomatic career. On the accession of King Louis to the throne, A., who had already occupied several important posts, was summoned to Munich, where, rapidly rising from one dignity to another, he at length became minister of finance and of foreign affairs. In both capacities he proved active and successful; but he drew upon himself the hatred of the Camarilla by his strenuous opposition to the claims of Rome, as well as by his attempts to identify himself with the decidedly liberal party. The consequence was that, in 1831, he lost his post, and in the same year was appointed ambassador to London, but preferred retiring to his family estate. However, he could not resist the king's repeated request that he would undertake the formation of his son's government in Greece, and accordingly, accompanying young King Otho, A. landed at Nauplia in January 1833. For four years he was at the head of public affairs, and Greece derived many benefits from his administration; but the heat of party strife and court intrigues led to his dismissal, and he left Greece in March 1837. His remaining years he passed in retirement upon his property, near Deggendorf. He died in 1853.

ARMATO'LES, a body of Greek militia, first formed under the reign of Sultan Selim I. about the beginning of the 16th c. They were intended to preserve the fertile plains from the ravages of the *Klepts* (mountain robbers of Thessaly), who had never been entirely conquered by the Turks. The A. themselves were originally Klepts, but received their more honourable designation when the Porte had metamorphosed them into a sort of military police. The safety of the public roads was intrusted to their care. The whole of Northern Greece was divided into sixteen districts (*capitaineries*), each placed under the supervision of a chief of these militia, who, however, had himself to receive orders

from a Turkish pasha or Greek bishop. But although the A. frequently suppressed the brigandage of the Klepts, they still regarded them in the light of brothers, inasmuch as they had a common origin and faith; both detested the oppressors of their country; and the sentiment of patriotism overruled every other consideration. This sympathy at last appeared to the Turks so dangerous that they grew alarmed, and desired to substitute for the A. the Mohammedan Albanians, who were the implacable enemies of the Greeks, which resolution did not a little to hasten the insurrection which the Porte ever dreaded. The moment it broke out, the A. pronounced themselves in favour of the national cause, and in the war of independence that ensued, distinguished themselves by their brilliant exploits.

ARMATURE (*armatura*, armour; Ger. *anker*). The term A. is applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. When magnets are allowed to remain any length of time without such appendages, in consequence of the disturbing influence of terrestrial magnetism they lose considerably in strength; but when they are provided with them their magnetism is kept in a state of constant activity, and thereby shielded from this disturbance. The reason of this is found in two facts well known in the science of magnetism—viz., that when a piece of soft iron is brought into contact with the extremity of a magnet, it is itself induced to become magnetic; and that the unlike poles of two different magnets powerfully attract each other. Referring to the figure, the north pole, N, of the horseshoe magnet, NBS, acting on the armature, *sn*, induces it to become a magnet, having its south pole, *s*, next to N, and its north pole, *n*, at the opposite extremity. The pole, S, by virtue of its magnetic affinity, powerfully attracts the north pole, *n*, thus formed, and adds its own inducing influence to heighten the magnetic condition previously induced in the armature by the pole N. The A., from the combined action of both poles of the horseshoe magnet, is thus converted into a powerful magnet, with its poles

lying in an opposite direction to that of the primary poles. The original magnet is, in consequence, brought into contact with one of its own making, the exact counterpart of itself—a condition highly favourable to the maintenance of its strength. It is due to the same mutual attractions that a much larger weight can be suspended from the A. thus placed, than what the single poles can together sustain. Bar magnets may be armed in the same way by laying them at some distance parallel to each other, with their unlike poles towards the same parts, and then connecting their extremities by two pieces of soft iron. When a magnet, such as a compass-needle, is free to take up the position required by the magnetism of the earth, the earth itself plays the part of an armature.

ARMED SHIP, in the official language of the Royal Navy, occupies a sort of medium position between a merchant-ship and a man-of-war. It is a private vessel, hired occasionally by the Admiralty for a special purpose, and commissioned for a temporary period. The duty is usually that of guarding some particular coast, or attending on a particular fleet, during a time of war; and while so employed, it is officered and equipped like one of the smaller ships-of-war in the Royal Navy.

ARMENIA, a high table-land on the southern slope of the Caucasus, stretching down towards Mesopotamia. It has had different boundaries in the various centuries of its history. It is the original seat of one of the oldest civilized peoples in the world, the Armenians, who belong to the Indo-Germanic family of nations. Their oldest records contain nothing certain beyond the facts that, in ancient times, they were governed by independent kings, but afterwards became tributary to the Assyrians and Medes. That dim period which wavers between myth and history begins, in the case of A., about the middle of the 6th c. B. C., when King Dikran, or Tigranes I. of the Haig Dynasty, restored the independence of the kingdom. The last king of this dynasty was slain in battle against Alexander the Great, who conquered the country. After Alexander's death, A. passed through several changes of fortune under the Seleucids, who appointed governors over it. Of these, two—Artaxias and Zariadres—made themselves independent of their sovereign, Antiochus the Great, during the time when he was engaged in his contest with the Romans, 223—190 B. C. They divided the province into two districts—Artaxias taking A. Major (that part of the country lying E. of the Euphrates), and Zariadres A. Minor (the part to the west of that river). The dynasty of Artaxias did not reign long; for about the middle of the 2d c. B. C., we find A. Major in the possession of a branch of the Parthian Arsacidæ, of which the most powerful king was Tigranes the Great, who added to the conquests made by his predecessors in Lower Asia and the region of the Caucasus, Syria, Cappadocia, and A. Minor; defeated the Parthians, and took from them Mesopotamia and other countries. He lost all these territories by his war with the Romans, into which he was led by his father-in-law Mithridates, king of Pontus, in 63 B. C. After this, the assaults of the Romans from the west ever growing more and more vigorous, and those of the Parthians from the east, hastened the downfall of A. Major. The successors of Tigranes became dependent, partly on the one nation and partly on the other, while internally the nobles broke through the restraints of a feeble monarchy, and claimed the privileges of petty kings. Under Trajan, A. Major was for a short time a Roman province. Its subsequent history exhibited an unbroken series of tumults and wars, of violent successions to the throne, despotic reigns, and rapid decay. In 232 A. D. the province was conquered by the Sassanides, who held possession of it 28 years, until Tiridates III., the rightful heir, was restored to the throne by Roman assistance.

It was about this time that Christianity became the religion of A., which was thus the first nation to embrace the new religion. Tiridates himself had been converted by St. Gregory the Illuminator as early as about 276 A. D. The old religion of Armenia had for its basis the doctrines of Zoroaster, with a curious intermixture of Greek mythology, and of ideas peculiar to the country. It is certain that the Armenians worshipped as their mightiest gods, Aramazt and Mihr (the Ormuzd and Mithras of the old Persians); but they had also a kind of Venus, whom they styled Anaitis, and several other deities, to whom they offered animal sacrifices. This change of creed, however, made no improvement in the political circumstances of the falling state. The Byzantine Greeks on one side, and the Persians on the other, regarded A. as their prey; and in 428, Bahram V. of Persia made A. a province of the empire of the Sassanides, and with the deposition of Artasir the dynasty of the Arsacidæ was brought to a close. The rule of the Sassanides in A. was

marked chiefly by their sanguinary but unsuccessful attempts to extirpate Christianity. In 632, the unhappy country was subjected to another form of despotism under the Arabian califs, and suffered terribly during their contest with the Byzantine emperors. In 885 A. D., Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the califs, and founded the third Armenian dynasty—that of Bagratidæ. Under them A. was prosperous till the 11th c., when divisions and internal strife began to weaken the country; till at length the Greeks, having murdered the last monarch of the Bagratidæ, seized a part of the kingdom, while the Turks and Kurds made themselves masters of the rest—only one or two of the native princes maintaining a perilous independence. In 1242, the whole of A. Major was conquered by the Mongols, and in 1472 became a Persian province. Afterwards the western part fell into the hands of the Turkish sultan, Selim II.

The fate of A. Minor was hardly better. The dynasty founded by Zariadres prevailed to the time of Tigranes the Great, sovereign of A. Major, who conquered the country about 70 B. C. Afterwards A. Minor was subjugated by the Romans, and made a Roman province. On the division of the Empire into eastern and western, it became attached to the former, and shared in all its changes of fortune until near the close of the 11th c. At this time A. Minor—which had long been a place of refuge for many who had fled from the rage of the Turks and Persians in the sister province—was again raised to independence by Rhupen (a refugee from A. Major, and descendant of the Bagratidæ). His successors extended their dominion over Cilicia and Cappadocia, and took a prominent part in the Crusades. This dynasty ruled prosperously until 1374, when A. Minor was conquered by the Egyptian sultan Schaban. Since that time A., with the exception of the parts which Russia has won in the present century from Persia, and which are better governed, has remained subject to the despotism of the Turks and Persians. Notwithstanding this, the Armenians have steadily preserved their nationality, both in its physical and moral lineaments; their faith; and even—though only a relic of their ancient culture—a higher civilization than their conquerors. The political storms which devastated the country during the middle ages, and the persecutions of the Turks, have driven many of the inhabitants from their homes. This is the reason why we find them scattered over all Asia and Europe. In Hungary, Transylvania, and Galicia they number 10,000. They are very numerous in Russia, but most of all in Asia Minor, and in the neighbourhood of Constantinople, where they number 200,000.

The greater part of A. is an elevated table-land. Its area is estimated at 90,000 square miles; pop. about 2,000,000. It is watered by the rivers Kur, Aras, Joruk, Euphrates, and to a slight extent by the Tigris. The lakes which lie within this mountainous region are Van, Urumiyah, and Sevan. The Armenian plateau, on the eastern side of which the volcanic range of Ararat lifts itself, forms the central point of several mountain chains, such as Taurus and Antitaurus, the mountains of Kurdistan, and those which run north to the Black Sea. It exhibits numerous traces of having been subject to volcanic agency, and even yet—as was shewn by the severe earthquake of the summer of 1840, and the recent (1859) total destruction of Erzerum—possesses an internal volcanic activity. The climate in the higher regions is hot in summer and cold in winter, but in the valleys it is more temperate. The country labours under a great scarcity of wood, and in some parts is sterile, through a deficiency of

water; in other parts the soil is extremely fertile, producing rice, hemp, flax, tobacco, wine, cotton, and many varieties of fruit. Cattle breeding and grazing are more extensive than agriculture. The mountains contain iron, copper, lead, salt, and naphtha. The number of the inhabitants of pure Armenian origin is reckoned at nearly 1,000,000, but there is a large admixture of Turkomans, Greeks, Jews, Kurds, &c. The Armenians belong physically to the finest variety of the Indo-Germanic race. Their intellectual capacity is also remarkable, as is shown both by their literature, and their singular dexterity in business. Still, long centuries of oppression have exerted a withering influence on their native strength of character, so that the mass of those who remain at home are sunk in superstition and ignorance. They profess Christianity. The principal towns in A. are Erivan (q. v.) and Akhalzikh (both belonging to Russia). Akhalzikh has a population of 12,000 or 13,000, is fortified, and adorned by a mosque and many Armenian churches. It possesses a college and library, and has trade in silk and honey. Besides these there are in Turkish A. Erzerum, Van, &c. (q. v.)

ARME'NIAN CHURCH. Christianity appears to have been introduced into Armenia as early as the 2d c., for, according to tradition, Dionysius, Bishop of Corinth, wrote an epistle to the Armenian Christians, who were then under the authority of a bishop named Meruzanes. It was first firmly established, however, about the end of the 3d c. by the apostolical exertions of Bishop Gregory (q. v.), who converted Tiridates (see ARMENIA). The Bible was translated into the Armenian language in the 5th c. After this period great animation prevailed in the A. C. Numbers flocked to the colleges at Athens and Constantinople. In the ecclesiastical controversy concerning the twofold nature of Christ, the Armenian Christians held with the Monophysites (q. v.); refused to acknowledge the authority of the Council of Chalcedon; and constituted themselves a separate church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself among them to a far wider extent than in the other Eastern churches. Their greatest divine is Nerses of Klah, belonging to the 12th c., whose works have been repeatedly published. The most recent edition was issued in Venice, 1833. The Gregorians have continued to entertain a deeply rooted aversion to the so-called orthodox church. It is true the Roman Catholic popes have at various times (1145, 1341, 1440), when the Armenians accepted the help of the West against the Mohammedans, tried to persuade them to recognise the papal supremacy; but, for the most part, only the nobles consented to do so, while the mass of the people clung to their peculiar opinions, as we see from the complaint of Pope Benedict XII., who accuses the A. C. of 117 errors of doctrine. There is a sect of *United Armenians* in Italy, Poland, Galicia, Persia, Russia, and Marseille. These recognise the spiritual sovereignty of the pope, and hold the same doctrines as the Roman Catholic Church, but have their own form of church-government. On the irruption of the Persians into Armenia, at the beginning of the 17th c., many of the inhabitants were forced to become Mohammedans, but by far the greater number remained true to their ancient faith. The A. C. has never scrupled to put itself under the protection of the Porte against the aggressive demands of the Catholics, and recently of Russia against the intrusions of Catholic and Protestant missionaries. Its theology differs from that usually styled orthodox, in attributing only

one nature to Christ, and holding that the Spirit proceeds from the Father alone; the latter doctrine, however, being held by it in common with the 'orthodox Greek Church,' although contrary to the theology of the western churches. With respect to the 'seven sacraments,' it entertains the peculiar notions that at baptism one must be sprinkled three times, and as often dipped; that confirmation is to be conjoined with baptism; that the Lord's supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek Church in the number of its fasts, but has fewer religious festivals. These, however, are more enthusiastically kept. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is carried on in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is *Catholikos*, resides at Etshmiadzin, a monastery near Erivan, the capital of Russian Armenia. To this place every Armenian must make a pilgrimage once in his life. The monks of this church follow the rule of St Basil. The *Wartabeds* form a peculiar class of ecclesiastics; they live like monks, but are devoted exclusively to learning. Secular priests must marry once, but none are at liberty to take a second wife.

ARME'NIAN LITERATURE. Previous to the introduction of Christianity by Gregory (300 A.D.), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favourite objects of study, and many Greek authors were translated into Armenian. (See Wenrich *De Auctorum Græcorum versionibus Arabicis, Armeniacis, &c.* Leipzig, 1842.) The Armenian language has an alphabet of its own, consisting of 36 letters, introduced by Miesrob in 406. The most flourishing period of A. L. extends from the 4th to the 14th c. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the East during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors; but in adherence to facts and good taste, they are superior to the general order of oriental historians. In the 14th c., literature began to decline, and few remarkable works were afterwards produced; but since the time of their dispersion, the Armenians have preserved recollections of their national literature; and wherever they are found—in Amsterdam, Lemberg, Leghorn, Venice, Astrakan, Moscow, Constantinople, Smyrna, Ispahan, Madras, or Calcutta—the printing-office is always a feature in their colonies. The most interesting Armenian settlement is that of the Mechitarists (q. v.), on the island of San Lazzaro, near Venice.

The Bible translated into Armenian (the Old Testament from the text of the Septuagint) by Miesrob and his scholars (411 A.D.), is esteemed the highest model of classic style. Translations of several Greek authors, made about the same time, have been partly preserved, and contain some writings of which the originals have been lost—namely, the Chronicle of Eusebius; the Discourses of Philo; Homilies by St Chrysostom, Severianus, Basil the Great, and Ephraim Syrus. Several old geographical and historical works have been preserved. Among philosophical and theological writers may be

mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Ozniensis. The *Vite Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. In poetry and fiction, A. L. is poor. Somal, in his work entitled *Quadro della Storia Letteraria di Armenia* (Venice, 1829), gives a general view of the contents of A. L. The Armenian belongs to the Indo-Germanic group of languages, but has many peculiarities of structure. It is harsh and disagreeable to the ear. The old Armenian, the language of literature, is no longer a living tongue; while the new Armenian, split up into four dialects, contains many Turkish words and grammatical constructions.

ARME'RIA. See THRIFT.

ARMFELT, GUSTAF MAURITZ, a celebrated Swede, whose public life was characterised by striking vicissitudes of fortune, was the eldest son of Baron Armfelt, and born at Juva, in the government of Abo, on the 1st of April 1757. Having, as an officer of the royal guard, displayed great activity and zeal in opposing the machinations of the nobles, who were at that period disaffected towards Gustavus III., the latter appreciated the value of his services, and appointed him to a post in the service of the Crown Prince. During the war between Sweden and Russia (1788—90), in which he was commander of one of the three divisions of the Swedish army, he displayed remarkable courage and spirit, and advanced still higher in the good graces of the monarch. He defeated a Russian force at Summa, near Fredrikshamn; and as military representative of Gustavus, had the honour of concluding a peace at Verela on the 14th of August 1790. On the 16th of March 1792, Gustavus was assassinated. His wound, though mortal, did not instantly deprive him of life, and he employed the brief interval that elapsed before his death in drawing up a codicil to his will, by which the regency was intrusted to the king's brother, Charles, Duke of Sudermania, during the minority of Gustavus IV., A. being named governor of Stockholm, and member of the council appointed to advise with the regent. The Duke of Sudermania, however, could not brook the idea of a check being placed upon his liberty of action, and found means to destroy the codicil, the conditions of which he never intended to observe. A. soon became conscious that his influence was rapidly evaporating. He was rarely permitted to see the young king; and at last, after a secret interview with young Gustavus, departed as ambassador to Naples in July 1792. While in Italy, he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency, and inducing the States to proclaim Gustavus IV. of age. The correspondence was discovered. A. fled to Poland, and afterwards to Russia. He was condemned, during his absence, for high treason, and stripped of his goods and titles, while one of his associates, the beautiful Countess Rudensköld, was subjected to the most brutal punishment, being publicly declared 'infamous,' exposed on a scaffold for some hours, and imprisoned in a house of correction for life. A. expressed his horror of such an atrocity in language sufficiently emphatic, yet, at a later period, he did not scruple to accept office under Charles, on his election to the throne. In 1799, Gustavus IV. received the crown at the age of eighteen, and A. was restored to all his honours. In 1805, he was appointed governor-general of Finland; and in 1808 he commanded the Swedish army raised for the invasion of Norway; but his plans were so completely frustrated, that he was compelled to

witness the invasion of Sweden by the successful Norwegians, and was in consequence recalled and dismissed by the king. In the following year a revolution took place, Gustavus was deposed, the Duke of Sudermania elected in his place, and A. was appointed president of the Military Council. But shortly after, being implicated in the poisoning of the Prince of Augustenburg, he was obliged to fly to Russia, where he lived during the remainder of his life in high honour. The title of Count was conferred on him, he was made chancellor of the university of Abo, president of the board of Finnish Affairs, and member of the Russian senate. He died at Tzarskø Selo on the 19th August 1814.

ARMIDA, one of the most prominent female characters in Tasso's *Jerusalem Delivered*. As the poet tells us, when the Crusaders arrived at the holy city, Satan held a Council to devise some means of disturbing the plans of the Christian warriors, and A., a very beautiful sorceress, was employed to seduce Rinaldo and other Crusaders. Rinaldo was conducted by A. to a remote island, where, in her splendid palace, surrounded by delightful gardens and pleasure-grounds, he utterly forgot his vows and the great object to which he had devoted his life. To liberate him from his voluptuous bondage, two messengers from the Christian army—Carlo and Ubaldo—came to the island, bringing a talisman so powerful that the witchery of A. was destroyed. Rinaldo escaped, but was followed by the sorceress, who, in battle, incited several warriors to attack the hero, and at last herself rushed into the fight. She was defeated by Rinaldo, who then confessed his love to her, persuaded her to become a Christian, and vowed to be her faithful knight. The story of A. has been made the subject of an opera both by Gluck and Rossini.

ARMIES, armed forces under regular military organisation, employed for purposes of national offence or defence. An army may comprise the whole military men employed by the state, or only a portion under a particular commander. When an armed force is under no constituted authority, and imperfect in its organisation and discipline, it cannot be said to be worthy of the name of an army, and may be little better than a horde of banditti. Of this nature are the *fillibustering* expeditions (see *FILLIBUSTERS*) in which certain portions of the citizens of the United States frequently engage. Through long ages of experience, the principles of military organisation, and the laws to which A. are specially amenable, have gradually reached a high degree of perfection. The primitive wars among barbarous people are always stealthy, depending on the forest and the wilderness for their tactics, and considered successful if an enemy can be attacked unawares, despoiled, and carried into slavery. After a time, war advances to the position of an art, and is conducted by men who have received a certain training. An army becomes an instrument not only for vanquishing enemies, but for seizing countries. Even then the highest position of an army is not reached; for the defence of a country requires more military skill, perhaps, and a better organisation of troops, than an attack.

In the several historical articles in this *Encyclopædia* relating to the chief nations of ancient and modern times, the wars in which these nations engaged are succinctly noticed as elements in the life of each nation; but it seems desirable, in the present place, as a means of rendering intelligible certain minor details scattered through the work, to give a brief description of the chief points in which the A. of different states or countries have differed in constitution.

ARMIES, ANCIENT—Egyptians.—The most extraordinary conqueror among the Egyptians, Sesostris or Rhamses, lived sixteen centuries before the Christian era; and although the evidence for his deeds of valour is very questionable, there is reason to believe that the organisation of his A. can be pretty accurately traced. His father, Amenophis, laid the foundation for the military glory of Sesostris. When the latter was born, Amenophis caused all the male children who were born on the same day as his son, to be set apart as a special body, to be reared for a military life; they were taught everything that could strengthen their bodies, increase their courage, and develop their skill as combatants and leaders; and were to consider themselves bound as the chosen dependents or companions of the young prince. In due time Sesostris became king of Egypt; and then he formed a sort of militia, distributed as military colonists, each soldier having a portion of land to maintain himself and his family. When this militia had been drilled to military efficiency, Sesostris headed them as an army for military conquest in Asia, and placed the chosen band above mentioned as officers over the different sections of the army.

Persians.—In the great days of the Persian empire, the flower of the army consisted of cavalry, who were distinguished for their bravery and impetuosity of attack. The infantry were little better than an armed mob. The war-chariots, too, though calculated to strike terror when dashing into hostile ranks, were available only on level ground. As to the numbers of men composing the great Persian A., the statements are too wild to be trustworthy. Allowing for all exaggeration, however, it is certain that the Persian A. were very large. When Darius was opposed to Alexander the Great, his army was set down at various numbers—from 750,000 to 1,000,000 men. The king was in the centre, surrounded by his courtiers and body-guard; the Persians and Susians were on the left; the Syrians and Assyrians on the right. The foot-soldiers, forming the bulk of the army, and armed with pikes, axes, and maces, were formed in deep squares or masses; the horsemen were in the intervals between the squares, and on the right and left flanks; and the chariots and elephants in front.

Lacedæmonians.—The Greeks introduced many important changes in A., both in the organization and in the manœuvres. Every man, in the earlier ages of the country at least, was more or less a soldier, inured to a hard life, taught to bear arms, and expected to fight when called upon. The leading men in each state paid attention to organisation and tactics in a way never before seen. It was not standing armies, but a sort of national militia, that gained Marathon, Plataea, and Mycale. So far as concerned the arrangement of A., the Lacedæmonians invented the *phalanx* (q. v.), a particular mode of grouping foot-soldiers. This phalanx consisted of eight ranks, one behind another; the front and rear ranks being composed of picked men, and the intermediate ranks of less tried soldiers. The number of men in each rank depended on the available resources of the commander. These men were mostly armed with spears, short swords, and shields.

Athenians.—The Athenians made a greater number of distinctions than the Lacedæmonians in the different kinds of troops forming their A. They had heavy infantry, constituting the men for the phalanx, and armed with spears, daggers, corslets, and shields; light infantry, employed in skirmishes and in covering the phalanx, and armed with light javelins and shields; a sort of irregular infantry, who, with javelins, bows and arrows, and slings, harassed the

enemy in march, and performed other services analogous in some degree to those of sharpshooters in a modern army. It is recorded that Miltiades, the Athenian hero at Marathon, invented the 'double-quick march,' to increase the momentum of a phalanx when rushing on the enemy.

Macedonians.—Philip of Macedon, the father of Alexander the Great, having the sagacity to see that he could not vanquish his neighbours so long as he adopted the same formation and tactics as themselves, set about inventing something new. He resolved to have a standing army instead of a militia; to have at command a set of men whose trade was fighting, instead of citizens who were traders and soldiers by turn. As a further change, he made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, four rows of men could present the points of their long pikes protruding in front of the front-rank, forming a bristling array of steel terrible to encounter. Besides these heavy infantry, there were light troops marshalled into smaller bodies for more active manœuvres. Philip organised three kinds of cavalry—heavy, armed with pikes, and defended by cuirasses of iron-mail; light, armed with lances; and irregular.

Thebans.—This nation introduced the army-formation of *columns*, much deeper than broad, or having more men in file than in rank. A new kind of tactics was introduced in accordance with this formation; the movement being intended to pierce the enemy's line at some one point, and throw them into confusion.

Romans.—These able warriors initiated changes in army matters, which had a wide-spread influence on the nations of the civilised world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred; but all were available up to the middle-time of life. They went through a very severe drilling and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the Senate decreed the formation of *legions*, or army corps, deputing this duty to the consul or prætor. Magistrates sent up the names of eligible men, and tribunes selected a certain number from this list. See **LEGION**. The Roman legion, in its best days, had many excellent military qualities—great facility of movement; a power of preserving order of battle unimpaired; a quick rallying-power when forced to give way; a readiness to adapt itself to varying circumstances on the field of battle; a formidable impetuosity in attack; and a power of fighting the enemy even while retreating. The heavy infantry were armed with javelins, having darts, pikes, and swords; the lighter troops with bows and arrows, slings, and light javelins; while the defensive armour comprised shields, cuirasses, helmets, and greaves.

Those ancient nations which had no distinctive features in their A., need not be noticed here.

ARMIES, MEDIEVAL. The downfall of the Roman Empire marked the dividing-point between ancient and mediæval times in military matters, as well as in other things that concern the existence of nations. The barbarians and semi-barbarians who attacked on all sides the once mighty but now degenerate Empire, gradually gained possession of the vast regions which had composed it. The mode in which these conquests were made gave rise to the *Feudal System* (q. v.). What all had aided to acquire by conquest, all demanded to share in proportions more or less equal. Hence arose a division of the

conquered territory; lands were held from the chief by feudal tenure, almost in independent sovereignty. When European kingdoms were gradually formed out of the wrecks of the Empire, the military arrangements put on a peculiar form. The king could not maintain a standing army, for his barons or feudal chieftains were jealous of allowing him too much power. He could only strengthen himself by obtaining their aid on certain terms, or by allowing them to weaken themselves in intestine broils, to which they had always much proneness. Each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy, there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valour than by any well-concerted plan.

One great exception to this military feudality was furnished by the *Crusades* (q. v.). So far as concerns A., however, in their organisation and discipline, these expeditions effected but little. The military forces which went to the Holy Land were little better than armed mobs, upheld by fanaticism, but not at all by science or discipline. Numbers and individual bravery were left to do the work, combination and forethought being disregarded.

A much greater motive-power for change, during the middle ages, was the invention of gunpowder. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valour, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after the period usually denominated the middle ages. The art of making good cannon and hand-guns grew up gradually, like other arts; and A. long continued to depend principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers.

During the greater part of the 14th and 15th centuries, the chief A. were those maintained by the Spaniards and the Moors on one European battleground, by the English and the French on another, and by the several Italian republics on a third. In those A., the cavalry were regarded as the chief arm. The knights and their horses alike were frequently covered with plate or chain armour: and the offensive weapons were lances, swords, daggers, and battle-axes. A kind of light cavalry was sometimes formed of archers on smaller horses. As to army-formation, there was still little that could deserve the name; there was no particular order of battle; each knight sought how he could best distinguish himself by personal valour; and to each was usually attached an esquire, abetting him as a second during the contest. Sometimes it even happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made, until towards the close of the 15th c., to embody a system of tactics and manœuvres for cavalry; and even that attempt was of the most primitive kind. Nor was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with the use of firearms; but, midway as it were between two systems, they observed neither completely; and the A. in which they served presented very little definite organisation.

ARMIES, MODERN. The formation of *standing* A. may be said to have introduced the modern military system. When the remarkable exploit of Jeanne d'Arc (Joan of Arc) had enabled Charles VII. to check the victorious progress of the English in France, he set about remodelling his army. By

gradual changes, and amid great difficulty, he converted his ill-governed forces into a disciplined standing army. During the reign of his son, Charles VIII. (1483—1498), the consequences of this change made their appearance. Charles conducted a well-appointed army into Italy (1494), in support of some pretensions which he had to the throne of Naples.

The change made by Charles VII. was not simply that of substituting a compact standing army for an ill-organised medley of feudal troops and of mercenaries; feudalism itself gave way under the influence of this combined with other reforming agencies. So far as concerned the actual formation and discipline of the standing A. above noticed, a few changes were from time to time introduced: pistols and carbines were given to the cavalry; cuirasses were worn by the heavy troopers; and new evolutions were introduced. During the Thirty Years' War (1618—1648), Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry: the former spread them out to a great width, and only six ranks in depth; whereas the latter adopted a narrower front, with a depth of twenty to thirty ranks. Frederick the Great, in the next century, introduced a most complicated system of tactics and drilling; insomuch that when he could manœuvre, he nearly always won his battles; but when the result depended on bold and unexpected onslaughts, he was more frequently a loser than a winner. The great military leader in the early part of the present century, Napoleon Bonaparte, made a larger use than any previous European general of the method of moving masses of troops with great celerity, beating the enemy in detail before they could combine in one spot.

It is desirable to present, in the most condensed form, a few statistics of the actual A. of Europe; leaving to future articles, under the names of the several countries, cities, and battle-fields, all details concerning special A. and military encounters. We shall select for this purpose the year 1869.

France.—The military forces of France consist at present of three divisions, the active army, the army of reserve, and the 'National Garde Mobile.' The duration of service is fixed at 5 years in the active army, at the expiration of which term the soldier must enter the reserve for four years longer. If the recruit has not served 5 years in the active army, he must remain 4 years in the reserve and 5 years in the national guard. As a rule, every Frenchman aged 21 is obliged to serve in the army, or in the guard, which is an army of defence. The regular army consists of 124 regiments of infantry, with 252,652 men; 66 regiments and one squadron of cavalry, with 62,798 men and 48,143 horses; and 29 regiments of artillery, with 39,882 men, 1362 guns, and 16,646 horses, the total number on the peace footing being 404,192 men and 86,368 horses, and on the war footing, 757,727 men and 143,238 horses. The effective force of the regular army at the beginning of 1869 was 334,280 men and 85,700 horses. The army of reserve numbered 195,546, and the National Garde Mobile, 381,728 at the beginning of 1869.

Prussia.—The Prussian army may be said to have had its birth in the time of Frederick the Great; it at one time comprised 200,000 of the best troops in Europe. At the present day it bears a ratio to the whole population scarcely equalled by that of any other country in Europe. Every Prussian subject is enrolled as a soldier as soon as he has completed his 20th year, and is obliged to be in service during seven years. At the end of this term he enters the 'Landwehr,' or militia, for nine years, and may be incorporated into the regular army in time of war. Leaving the 'Landwehr,' he is finally enrolled, till the age of fifty, in the 'Landsturm,' which is

only called upon for service when the frontiers are invaded.

Setting aside a few exceptions, the whole male population of Prussia may be said to be trained to arms. According to official returns at the end of April, 1869, the Prussian army comprised 299,704 rank and file, 73,370 horses, and 12,924 officers. Of this number the infantry of the line comprised 188,943 men and 6697 officers; riflemen or 'Jäger,' 8480 men and 352 officers; infantry of the 'Landwehr,' 3512 men and 413 officers; cavalry, 52,786 men and 1898 officers; artillery, 31,854 men and 1672 officers; engineers, 6489 men and 234 officers; military train, administrative, and other troops, 7640 men and 1640 officers. This is the strength of the peace footing. On the war footing the numbers can be raised to 700,000 men.

Austria.—By the terms of compromise between Austria and Hungary, the military forces were divided, in 1869, into the standing army, the Landwehr or militia, and the Landsturm. The regiments of the standing army are under the control of the minister of war of the empire, and the Landwehr is controlled by the Austrian and Hungarian Ministers of Landesvertheigung (home defence). The king-emperor is the supreme chief of the military and naval forces of the empire. The standing army is formed by conscription, every man being liable on reaching his 20th year. The term of service is 10 years, 3 of which must be spent in active service and 7 in the army of reserve. In the Landwehr, the term of service is 12 years. In April, 1869, Austria possessed a standing army of 246,695 on the peace footing, and 822,472 on the war footing. Of these, the *Infantry* were comprised in 80 regiments, 1 regiment of Kaiser-jäger, of Tyrol, and 33 battalions of Feld-jäger, with 141,691 men in peace, and 544,223 in time of war. The *Cavalry* numbered 14 regiments of dragoons, 14 of hussars, and 13 of lancers, with 35,547 men in peace and 58,835 in time of war. The *Artillery*, 12 regiments of field and 12 battalions of fortress, with 25,658 men in peace and 62,741 in time of war. *Engineer and Field train*, 10,571 men in time of peace, and increased to 45,528 when on a war footing; and finally, 15 frontier regiments of infantry, numbering in peace 10,799, in war 54,667, and a miscellaneous force in the commissariat, sanitary, arsenals, and police departments of 21,329 men in peace, and of 38,368 in time of war. The general staff is composed of 3 field marshals, 16 generals of cavalry and ordnance, 71 lieutenant field marshals, and 111 majors general.

Germany, North.—The campaign army of the Confederation of the North, which includes that of Prussia, numbers, in time of peace, 287,597 men, and in time of war, 511,826. It is composed of 13 corps d'armee, or 27 divisions, forming 54 brigades of infantry, 28 of cavalry, and 13 of artillery. The several states furnish their respective contingents to the army of the Confederation, which consists of *Infantry*, 9 regiments of the guard, in 27 battalions, with 17,035 men in peace, and 27,451 in time of war; 109 regiments of the line, with 173,665 men, and in time of war increased to 326,121 men; *Riflemen or Jäger*, 9612, and in war, 18,108; total infantry, 200,312 on a peace footing, and 371,680 on the war footing. *Cavalry* of the guard, 8 regiments of 5707; of the line, 68 regiments with 48,416; total cavalry, 54,123. *Artillery*, 13½ regiments, containing 201 batteries of 804 cannon, manned in time of peace by 23,546 men, increased to 214 batteries of 1272 cannon and 41,439 men on the war footing. *Pioneer and Train* comprises 26½ battalions, numbering in peace 9618 men, and in time of war 54,570 men. Besides the above, there are in the depots 180,672 men, and in garrisons 211 battalions of 3714 men, which can be increased by the Landwehr, in time of war, to 219,502; also,

12,696 officers and 6135 men in the schools, invalided, etc., making a grand total in time of peace of 319,476, and 977,262 when prepared for war.

Russia.—The land forces of Russia are formed of regular troops, and the feudal militia, or irregular troops, from the Cossacks and similar races. The regular army is recruited partly by conscription from the peasants and artisans, and partly by voluntary enlistment. Every individual of the classes named, with few exceptions, is liable to compulsory service on reaching a proper age, which is fixed at 22 years for the guard and 25 years for other troops. The nominal strength of the regular army on the peace footing is, infantry, 364,422; cavalry, 38,306; artillery, 41,731; engineers, 13,413; total, 458,875. When on the war footing, infantry, 694,511; cavalry, 49,183; artillery, 48,773; engineers, 16,203; total, 808,670. The first army of reserve numbers, of troops of the line and garrison, in time of peace, 100,285 men, and in time of war this may be increased to 127,925. A second army of reserve is composed of 254,036 men in peace, and of 199,380 in war; making a grand total of 812,096 in peace, and 1,135,975 on the war footing. The Cossacks are the most important of the irregular troops, and every head, of which there are 875,000, is bound to render military service when required, but 126,000 only are actually in the employ of the government.

Denmark.—The Danish army comprises 20 battalions of infantry of the line, with 10 depot battalions and 10 of reserve, 5 regiments of cavalry, each with 2 squadrons active and 2 depot, and 2 regiments of artillery and 12 batteries. The total strength of the army, exclusive of the reserve, is 36,782 rank and file, with 1068 officers, on the peace footing, and 47,925 rank and file, with 1328 officers on the war footing. Conscription for the army commences at the age of 22 years, and continues for 8 years.

Sweden and Norway.—The Swedes are fond of military display; they hate conscription, but will cheerfully enlist. The army is classified into a national military of 33,405 men; conscription troops, aged between 20 and 25 years (19,000 being drafted annually), 95,295; enlisted troops, 7692, and the militia of Gotthand, 7921; a total, not counting volunteers (40,848 in 1869), of 144,313. In Norway, not more than 12,000 men can be under arms in time of peace, nor more than 18,000 in time of war, without the consent of the Storting. The king may keep a guard of Norwegian volunteers, and may transfer 3000 men annually from Sweden to Norway, and *vice versa*, for military exercise; otherwise no Norwegian soldier can be permitted to enter the sister kingdom.

Belgium and Holland.—According to the law of 1868, the strength of the army is to be 100,000 men on the war footing, and 40,000 in time of peace. Of the rank and file, 74,000 are infantry, 7903 cavalry, with 6572 horses, 16,867 artillery and engineers, with 152 guns and 4050 horses. Besides the standing army there is a civic militia—Garde Nationale—organized in 1848 and 1853 to maintain liberty and order in time of peace, which numbers 125,000 men without and 400,000 with the reserve.

The Dutch army, partly formed by conscription and partly by enlistment, was composed, at the beginning of 1869, of 59,078 rank and file and 1984 officers. Of these, 38,280 were in 8 regiments of the line, and 4221 formed one regiment of guards; 4310 were in 4 regiments of hussars; 6297 in 3 regiments of heavy fortress artillery, and 3156 formed 1 regiment of field artillery.

Italy.—The standing army in 1869 was composed of 199,557 men under arms on the peace footing, and 244,952 men on illimited furlough, making a total on the war footing of 445,509 men. This was commanded by 14,797 officers, not included in the above

returns. Of the above, on the peace footing, 118,850 were infantry of the line, 14,927 bersagliari, 16,165 cavalry, 17,202 artillery, and 19,628 carabinieri. The time of service in the standing army is 10 years. Every native of the kingdom is liable to conscription, and to be enrolled either in the standing army or army of reserve.

Turkey.—The military force of T. is composed of 36 regiments of infantry of 100,800 men; 24 of cavalry of 17,280; 6 of field artillery of 7800; 4 of artillery in fortress of 5200; 2 of engineers of 1600; and 8 of detached corps, in Candia, Tripoli, and Tunis, of 16,000; numbering in all 80 regiments of 148,680 men on the peace footing. On the war footing the above regiments are increased to a grand total of 459,360 men.

The army of Spain in 1868 was composed of 151,668 men and officers. That of Portugal, in 1869, numbered 18,185. That of the Papal States, in the beginning of 1869, was made up of 9588 men, Italians, Belgians, Swiss, and Irish. The army of Greece, in 1869, was stated to be composed of 14,716 men and officers, and that of Switzerland, in April, 1869, was made up of the federal army of 85,138, the army of reserve, 50,559, and the Landwehr of 64,323, making a total of 200,020, to which must be added the Landsturm, for home defence only, of 150,000.

United States.—The A. of the U. States at the beginning of 1861 consisted of about 16,000 regular troops, mostly stationed on the Western border. In April 1861, a call was made by the President for 75,000 volunteers, and in May 75,000 more were required. By subsequent proclamations and acts of Congress the A. was increased, and the whole number enrolled amounted to 2,653,062; and on May 1, 1865, 1,034,065 men were in the national service. During the summer and autumn of 1865, the A. was disbanded at the rate of 300,000 per month, and at the close of 1868 numbered about 40,000 regular troops.

A separate and fuller treatment of the army of Great Britain is reserved for BRITISH ARMY. All the various matters relating to the formation, organisation, discipline, arms, equipments, duties, and tactics of A., will be found succinctly treated under appropriate headings.

ARMILLARY SPHERE (*armilla*, a ring), an instrument intended to give a just conception of the constitution of the heavens, and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers, made many of their observations, and we find even Tycho Brahe making most of his planetary observations with the help of such an instrument. The A. S. is, however, now only used as an aid to instruction in astronomy, and in this respect is generally supplanted by the celestial globe. The object aimed at in the A. S. will be better understood by reference to the celestial globe represented in the diagram. Supposing the observer on the earth to be in the centre of the sphere, the earth on which he stands shuts out from his view the lower half of the heavens, or the part lying below the horizon HH. The hemisphere above him may be regarded as divided into two equal portions, an eastern and a western, by the meridian MM, which passes through the pole P, and the zenith Z, of which the eastern half is shewn in the figure. The north pole is supposed to be elevated above the horizon, and its elevation is measured by the arc NP, or the height above the north point; and the heavens appear to rotate round an axis PQ, of which P is one

extremity; the south pole, Q, the other extremity, being below the horizon. The meridian MM, and the horizon HH, are the only circles which maintain a fixed position with regard to the observer.

Of the other leading celestial circles, the equator or equinoctial LL, extending from the east to the west point of the horizon, the tropics of Cancer and Capricorn, respectively BB and CC, and the arctic circle AA, although rotating with the stars, maintain the same position with regard to the horizon; while the ecliptic, KK, is constantly changing its inclination and position towards it. Circles which extend from pole to pole, cutting the equator at right-angles, are called circles of declination. The circle which passes through the vernal equinox φ (see **ARIES**), is denominated the equinoctial colure; and that passing through the summer solstice O (see **SOLSTICE**), the solstitial colure. The circles just named, together with the Antarctic Circle, are represented by corresponding rings in the A. S. If S be a star, the following are the names given to the arcs which determine its position with regard to these circles: φ V, Right ascension; SV, Declination; SP, Polar distance; SZ, Zenith distance; XS, Altitude; (XN + 180°), Azimuth, reckoned from the south pole westward.

ARMINIUS, JACOBUS, the founder of Arminianism, was born at Oudewater (Old Water) in 1560. His real name in Dutch was James Harmensen; but in accordance with the prevailing custom amongst scholars in those days, he Latinised it. His father was a cutler, and died when A. was a child. After a preliminary education at Utrecht, he commenced (in 1575) a course of study at the newly founded university of Leyden, where he remained for six years, and where he seems to have acquired a high reputation, for the Amsterdam merchants undertook to bear the expense of his further studies for the ministry, on condition that he would not preach out of their city unless permitted to do so. In 1582, he went to Geneva, and received the instructions of Theodore Beza, the most rigid of Calvinists. Here he made himself odious by the boldness with which he defended the logic of Peter Ramus, in opposition to that of the Aristotelians of Geneva, and in consequence had to retire to Basle, whither his fame must have preceded him, for he was offered by the faculty of Divinity in that university the

degree of doctor gratis, which, however, he did not venture to accept, on account of his youth. At Basle he studied under Gyræus. He subsequently (1586) travelled into Italy. On his return to Amsterdam (1588), he was appointed minister. Shortly after this, he was commissioned to defend the doctrine of Beza, regarding predestination, against the changes which the ministers of Delft had proposed to make on it. A. carefully examined both sides of the question, but the result of the study was, that he himself began to doubt, and at last came to adopt the opinions he had been commissioned to confute. Some time after this change of view, he came, in the course of his expositions, upon the Epistle to the Romans, the most explicitly doctrinal in the New Testament, and the 8th and 9th chapters of which have always been considered the strongholds of Calvinism. His treatment of this epistle excited much dissatisfaction, and involved him in sharp disputes with his orthodox brethren. Still his views were, as yet, either ambiguously or vaguely expressed, or, at least, had not attained to that clear consistency they subsequently acquired, for in 1604 he was made professor of theology in the university of Leyden.

The greatest enemy of A. was Francis Gomar, his colleague in the university of Leyden. In the course of the year 1604, the latter attacked his doctrines, and from that hour to the end of his life, A. was engaged in a series of bitter disputes with his opponents. The *odium theologicum* was never exhibited in more unmingled purity. Arminius asserted, in substance, that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; he wills that all men should attain salvation, and only because he has from eternity foreseen the belief or unbelief of individuals, has he from eternity determined the fate of each. On the other hand, Gomar and his party, appealing to the Belgic Confession and the Heidelberg Catechism, maintained, that God had, by an eternal decree, predestinated what persons shall, as being elected to salvation, be therefore awakened to repentance and faith, and by grace made to persevere therein; and what persons shall, as being rejected (*reprobati*), be left to sin, to unbelief, and to perdition. See PREDESTINATION, PERSEVERANCE.

While these fierce disputes were continuing, A., who was not destitute of either friends or influence, was created *rector magnificus* of the university, but resigned the honour on the 8th of February 1606, having held the office only for one year. All the pulpits in Holland now fulminated against him. At length, in 1608, A. himself applied to the states of Holland to convoke a synod for the purpose of settling the controversy; but, worn out with care and disease, he died, on the 19th of October 1609, before it was held, leaving seven sons and two daughters by his wife, Elizabeth Reael, daughter of Laurent Reael, a judge and senator of Amsterdam.

There can be no doubt that A. himself was much less Arminian than his followers. He had not matured his opinions sufficiently to elaborate a complete system of anti-Calvinistic doctrine, though it is perfectly certain that the conclusions at which his disciples arrived—as stated in the famous ‘Five Articles’—are the logical and legitimate results of his teaching. He always complained, however, that his opinions were misrepresented; but this is invariably the fate of controversialists, and the penalty of controversy. A. was an extremely good man, as even his enemies allow; his abilities were also of a high order; his thinking is clear, bold, and vigorous; his style remarkably methodical, and his scholarship respectable, if not profound.

After the death of A., his followers gained strength, and boldly asserted their views, but still

remained in a minority. In 1610, they presented to the assembled states of the province of Holland a ‘Remonstrance’—from which they were styled ‘Remonstrants’—which contained the following propositions: 1. That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. 2. That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. 3. That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. 4. That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. 5. That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong ‘Counter-remonstrance,’ asserting plainly absolute predestination and reprobation. After several fruitless discussions, the states of Holland, in January 1614, acting under the advice of Oldenbarneveld, a senator, and the learned Hugo Grotius, issued an edict of full toleration for both parties, prohibiting at the same time the continuance of the controversy. The Counter-remonstrants (or Calvinists) refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waard-gelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death—among them the aged senator Oldenbarneveld, May 13, 1619—while Grotius and others were imprisoned. In these circumstances, the synod of Dort was held (1618—1619), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (January 14, 1619), the thirteen Arminian pastors, with the learned and eloquent Simon Episcopus at their head, were excluded. The doctrines of the Counter-remonstrants were embodied in ninety-three canons; the Belgic Confession and the Heidelberg Catechism were confirmed as authorities for the reformed churches of the Netherlands; and three hundred Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter in France, Holstein, England, &c. Afterwards, under Frederick Henry, the stadtholder after Prince Maurice (1630), they were again tolerated in Holland, and in 1634 Episcopus opened his theological college in Amsterdam.

Since that time, the Remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions and independence in church government. The rejection of all creeds and confessions; the free interpretation of the Scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness, and the view of the sacraments as merely edifying forms or ceremonies: all these and other points of belief display the same tendency

which is found in their church polity. Their annual conference on ecclesiastical affairs is composed of ministers and lay-deputies, and takes place in June, alternately at Amsterdam and Rotterdam. The number of Remonstrants is now only about 5000, and is still decreasing. In 1809, they had 34 congregations with 40 preachers in Holland; but in 1829, only 20 congregations with 21 preachers. The largest society of A. is in Rotterdam, and numbers only 600 members.

Although the Arminians are thus dwindling away as a distinct body, their tenets respecting predestination have been adopted with greater or less modification by several other Christian denominations (see METHODISTS, WESLEYAN; BAPTISTS, GENERAL); as well as by multitudes of the individual members of those churches whose formularies are Calvinistic (see CALVINISM). They are also very prevalent in the Church of Rome.

ARMISTICE, a suspension of hostilities between two armies, or two nations at war, by mutual agreement. It sometimes takes place when both are exhausted, and at other times when an endeavour to form a treaty of peace is being made. A particular example will best illustrate the nature of an A. On the 25th of February 1856, the representatives of England, France, Austria, Prussia, Sardinia, Turkey, and Russia, met in congress at Paris, to consider the terms of a treaty of peace which should terminate the war at that time going on between five of the above-named powers. The British nation was very unwilling to suspend hostilities during the sitting of the congress—partly on account of the numerous failures of diplomacy in the preceding year, and partly because Russia was suspected of only wishing to gain time. It was agreed, however, at the first sitting, in conformity with the laws of nations and the usages of war, that an A. should be declared to be announced by telegraphic message to the commanders in the Crimea, and to last until the 31st of March. During that period of about one calendar month, the hostile armies were to remain strictly at peace, but the fleets of the allies were to continue their blockade of Russian ports. The information reached the generals late on the 28th of February. On the morning of the 29th, a white flag was hoisted in the Russian camp outside Sebastopol; several Russian officers assembled around it; and a glittering cavalcade of British, French, and Sardinian officers proceeded thither. The accredited officers compared notes, found the terms of the A. clear, agreed on a boundary-line between the hitherto hostile forces, and formally gave pledges for a cessation of fighting. The courtesy of civilized nations at once succeeded to the horrors of war; the Russian commander gave a magnificent entertainment to the allied commanders, and was entertained in turn; the soldiers 'fraternised,' by little gifts of tobacco, and ludicrous attempts at conversation, across a small stream which formed part of the boundary line; and a few British officers were permitted to make excursions into the interior of the Crimea. The A. ended on March 31, not by a renewal of hostilities, but by the signing of a treaty of peace.

ARMORER. The old meaning of this word has nearly passed away with the system to which it belonged. The armour-smiths, or makers of armour, were among the most skilful workers in metal during the feudal times; but their trade afterwards fell away. In the year 1690, the workmen-armorers of London, in a petition to parliament, complained that their trade was well-nigh ruined.

Armorer, in a somewhat different sense of the word, belong to the British army and navy at the present time. There are armorers to every

regiment, not to make armour, but to repair arms. There is one to each troop of cavalry, and one to each company of infantry. The A. is paid one penny per month for taking to pieces and cleaning the lock of each soldier's musket. There is also a regular tariff of prices for every minute detail of repair in the stock, lock, or barrel of muskets, pistols, carbines, and rifles, and in bayonets and ramrods. A school for training 'A.-sergeants' has recently been established in London, to supply one such artificer to each battalion, who shall have a certain degree of control over the ten or twelve company-armorers in the battalion.

On shipboard, the A. is a warrant-officer, who has charge of all the muskets, pistols, cutlasses, boarding-pikes, &c., which he is expected to keep clean and in ready order. He is assisted by a subordinate called the 'A.'s mate,' and both are skilled in the general routine of smith's work.

ARMORICA, the country of the Armorici, i. e., 'the dwellers on the sea' (Celt. *ar*, on or near; and *mor*, sea), the name by which the people occupying the coast of Gaul between the Seine and the Loire were known to Cæsar. At a later period, the name A. was confined to the country afterwards styled Britannia Minor, or Bretagne (q. v.).

ARMORY may mean a storehouse for arms; but the name is also often applied to a collection of ancient armour and weapons—such as those in the Tower of London, in Sir Samuel Meyrick's mansion at Goodrich Court on the Wye, and in Warwick Castle.

ARMOUR is a general name for the apparatus for personal defence, as contradistinguished from arms or weapons of offence. Little of it is worn by soldiers at the present day, seeing that hand-to-hand conflicts, in which it is especially serviceable, are rather exceptional in modern warfare. It was before the invention of gunpowder that A.—often called in England by the name of *harness*—was especially used.

All the ancient nations who occupy a place in history, were accustomed to adopt one or other of the defensive clothing or implements which collectively come under the denomination of A. Leather-A. was sometimes worn; but brass, iron, and other metals were preferred. Some of the more luxurious leaders had much silver and gold in their A. In the Bible, shields, helmets, breastplates, and greaves, are mentioned among the articles of A. borne or worn by the Israelites and their opponents. The classical writers—Homer, Xenophon, Herodotus, Livy, Tacitus, Varro, &c.—supply abundant evidence of the use of A. among the nations concerning whom they wrote.

It is believed that the early Britons bore little or no other A. than shields. The Anglo-Saxons were more fully provided. At different times before the Norman Conquest, they appear to have had four-cornered helmets; loricae made of leather; scale-A.; leathern helmets; wooden shields covered with leather; sheep-skin shields; conical caps or helmets of metal; pectorals or neck-guards; breast-guards of undressed hide; flat-ringed A.; byrnes or tunics of overlapping pieces of leather; close-fitting cuirasses of leather, and sometimes of strong linen; leg-guards of twisted woollen cloth; shields of various sizes, from half a yard to a yard and a half in length; and casques having more or less resemblance to the ancient helmets. When the Danes were in Britain, they had at first no other A. than leathern neck-pieces, which descended some way over the shoulders and chest; and greaves or shin-pieces for the legs. In the time of Canute or Knute, however, they adopted a kind of A. which

Sr Samuel Meyrick supposes them to have borrowed from the Norsemen or Norwegians. It comprised a tunic, with a hood and long sleeves; pantaloons which covered feet as well as legs; and sugar-loaf shaped helmets or skull-caps, with attached pieces which hid nearly the whole face except the eyes. All these were probably made of leather; but most of the surfaces were strengthened by mail or maces, a perforated net-work of steel.

With William the Conqueror came in the kinds of A. which were at that time prevalent among the knights and soldiers of the continent of Europe, and which became afterwards more or less combined with the A. previously known in England. William himself occasionally wore a hauberk of ring-A. This kind of A. was much worn during his reign, the rings being usually attached to a foundation of leather. One curious variety of ring-A., called the haubergeon, had the tunic and breeches all in one piece. The helmets were generally conical, with a nasal or nose guard descending from the front. A distinct ring-A., called *hose*, was often worn on the legs. The shield was generally kite-shaped, unlike the oval shield carried by the Anglo-Saxons. Gradual changes in these various portions of A. were made between the reigns of William Rufus and John. Under Henry III., we find stitched and padded hauberks and chausses, called 'ouvrages de pourpointerie,' suits of ring-A.; greaves or shin-pieces of steel; poleyns or knee-guards; vambraces or arm-guards; jacks, jaques, or jackets, made of leather, and worn over the ring-A.; interlaced ring-A., of oriental invention, not requiring to be stitched to any garment or foundation; helmets, visors, and skull-caps of various forms; and chanfrons, or A. for the head and face of horses. During Edward III.'s reign, iron plate-A. was much used by troopers, in the various forms of helmet, breast-plate, gauntlet, and greaves. In the 14th c., chain-mail fell into disuse, and was succeeded by plate-A.; this last-named kind became more and more complicated, and reached its greatest pitch of elaboration in the reign of Richard III. During the times of Henry VII. and VIII., the A. was sometimes fluted, often elaborately engraved, and even damascened or inlaid with gold. Under James I., the knightly ideas of the feudal times gave way, and the use of A. declined; a knight armed *cap-à-pie* was a rarity. Charles I. tried to revive its use,

The chief pieces of A. will be found briefly described and illustrated under the proper headings.

ARMS, or weapons of offence, may be divided into two great classes—those that act by means of gunpowder, and those that do not. Of arms that act otherwise than by explosion, the greater part have been in use from the earliest times; they include the bow and arrow, sling, pike, spear, lance, dart, javelin, dagger, axe, mace, spiked or knotted club, scythe for chariots, dirk, bayonet, sword, cutlass, &c., together with such artillery as the ballista, catapult, and battering-ram. Weapons depending on the use of gunpowder are of two kinds—those that can be held in the hand, and those that are too heavy to be portable. In the first class, we find the names of the hand-cannon, hand-gun, arquebus, haquebut, demi-haque, matchlock, wheel-lock, firelock, currier, snaphaunce, caliver, escolopette, petronel, dragon, hand-mortar, dag, tricker-lock, carbine, fusil, fowlingpiece, blunderbuss, pistol, musket or musquet, musketoon, rifle, &c. In the second class, more usually included under the name of artillery, we find the springel, war-wolf, bombard, cart-of-war, culverin, demi-culverin, serpentine, falcon, saker, cannon, howitzer, petard, carronade, mortar, rifled cannon, war-rockets, &c. The more important of these are briefly noticed under the proper headings.

The Adjutant-general of the British army watches the state of the A. in all the regiments and at all the stations, receives reports on their condition, supplies all deficiencies, and insures readiness for immediate service. Each regiment makes a report to him on these subjects yearly. If the commanding officer of a regiment ascertains that a new supply of A. is needed for the men under him, or a supply of anything in relation to the A., he notifies the fact to the army agent for the regiment, who acts in many ways as a sort of factor or middleman. See AGENT, ARMY. The agent applies to the War-office. The Secretary of State for War, if satisfied that the demand is proper, writes an order for the supply; this order is sent to the Adjutant-general, who acts as the second in influence under the Commander-in-chief; and then the store-keepers or ordnance officers receive orders to furnish the supply.

ARMS, ARMO'RIAL BEARINGS, or ENSIGNS, are the names given to such devices as when painted on a shield form a coat. These terms in popular speech include all the accompaniments of a shield—viz., the crest, helmet, and where such exist, the supporters, &c. See these terms. See also HERALDRY.

ARMS, ASSUMPTIVE. See HERALDRY.

ARMS, BELLS OF, or tents, mostly of a conical shape, for containing the small-arms for each company in a regiment of infantry. The tent is frequently painted with the colour of the facings of the regimental uniforms.

ARMS, MESSENGER AT. See MESSENGER-AT-ARMS.

ARMS, SERJEANT AT. See SERJEANT-AT-ARMS.

ARMS, STAND OF. A stand of A. is the complete set necessary for the equipment of one soldier, whether horse or foot.

ARMSTRONG, JOHN, physician and poet, was born about 1709 at Castletown, a pastoral parish in Roxburghshire, of which his father was minister. He studied medicine at the university of Edinburgh, where he took the degree of M.D., February 4, 1732. Soon after, he commenced practice in London, and became known by the publication of several fugitive pieces and medical essays. In 1737 he published a very objectionable poem, *The Economy of Love*, which injured his reputation for a time. His principal

Suit of Armour,

presented by the Emperor Maximilian to Henry VIII.

but he had few followers; and the days of Cromwell may be regarded as the last in which A. was worn to any considerable extent by the regular soldiers. Helmets and cuirasses are still worn by the three regiments of Household Cavalry (Life-guards and Horse-guards), but more for show than for service.

work, *The Art of Preserving Health*, a didactic poem in blank verse, extending through four books, appeared in 1744. In 1746 he was appointed physician to the hospital for sick and lame soldiers. In 1751 he published a volume on *Benevolence*; in 1753, a poetical epistle on *Taste*; and in 1758, a volume of prose essays of no great merit. In 1760 he was appointed physician to the forces in Germany. In 1761 appeared from his pen *Day, a Poem*. On the peace in 1763, he returned to London, and resumed practice. In 1771 he made a continental tour with Fuseli, the painter, an account of which he published, with the title of *A Short Ramble through some Parts of France and Italy, by Lance'ot Temple, Esq.* His last work was a volume of medical essays. He contributed to Thomson's *Castle of Indolence* the four stanzas at the end of the first part, descriptive of the diseases resulting from sloth. Died 7th September 1779. A. was the friend of Thomson, Mallet, Aaron Hill, Dr. Young, Wilkes, and the principal wits and literary men of the period. He seems to have been a reserved, indolent, and splenetic man, 'who quite detested talk;' kind-hearted withal, and of frugal habits, having left £3000, saved out of a small and precarious income. His fame rests entirely on *The Art of Preserving Health*, his other works being now only known by name.

ARMSTRONG, JOHN, an eminent physician and medical writer, was born 8th May 1781, at Ayres Quay, near Bishop-Wearmouth, where his father was the superintendent of some glassworks. He studied medicine at the university of Edinburgh, and in June 1808 took the degree of M.D. He commenced practice at Bishop-Wearmouth, and in 1811 was chosen physician to the infirmary at Sunderland. In 1816 he published a work on *Typhus*, which greatly extended his reputation. His researches concerning the causes and phenomena of febrile diseases having made his name well known in the metropolis, he was induced, in February 1818, to remove to London, where his practice became extensive, and he was elected physician to the Fever Hospital. In 1821, in concert with Mr. Edward Grainger, he established a medical school in Webb Street, Borough, where he lectured on the practice of physic. He also delivered a course of lectures on *Materia Medica*. In 1826 he joined Dr. Boot and Mr. E. Bennett in establishing a new school of medicine in Dean Street, Soho, but shortly after relinquished his connection with it. He died of consumption, 12th December 1829, aged 45. Exclusively devoted to the duties of his profession, Dr. A. was very successful in the elucidation of medical science. His works are numerous, and he contributed various papers to the medical journals. His lectures, inserted in the *Lancet* in 1825, were published in a separate form after his death, with the following title, *Lectures on the Morbid Anatomy, Nature, and Treatment of Acute and Chronic Diseases, by the late John Armstrong, M.D. Edited by Joseph Kez*—one of his pupils. (London, 1834, 8vo.)

ARMSTRONG, SIR WILLIAM GEORGE, noted for various mechanical inventions, and particularly that of a gun of extraordinary power and precision, was born in 1810 at Newcastle, where his father was an eminent corn-merchant, and in 1851 filled the office of mayor. A. was educated at the school of Bishop-Auckland; but his peculiar mental powers were chiefly cultivated by the opportunities which his father's taste gave him at home, of acquainting himself with chemistry, electricity, and mechanics. Though the natural bent of his mind was to some profession in which these sciences would have been available, he readily yielded to his father's wishes, and was articled to Mr. Armourer Donkin, an

eminent solicitor in Newcastle, who, at the expiration of his time, adopted him as a partner. A high sense of duty enabled A. to give his excellent general powers of mind to business; but he devoted much of his leisure to his favourite pursuits, and his inventive faculty was constantly active. About 1838, observing one day a little stream descending along a height near Newcastle, and driving but a single mill, he thought to how much more purpose it might be applied hydraulically, and thus was led into a course of experimenting, which resulted in his producing a much improved hydraulic engine, of which a description was given in the *Mechanics' Magazine* for April 18, 1840. Following up this invention with a view to practical applications, he gave to the world, in 1845, a hydraulic crane, which has proved to be of eminent utility in raising weights at harbours and in warehouses. The discovery of electricity in steam by a workman at a fixed engine on the Cramlington Railway in 1840, had meanwhile led A. into a new path, and in 1842 he brought to perfection an apparatus for producing electricity from steam, which was soon after introduced into the Polytechnic Institution in London. The evolution of the electricity depending in reality on the friction sustained by the small quantity of water which accompanies the steam in its discharge, the great merit of A.'s invention in this case lay in the form he gave the orifice through which the steam passed. A friend, writing of A. at this time, remarked that he ought to have been an engineer, so great evidently were his talents for mechanical science. 'Plain, simple, and unassuming, no one at first sight could form any idea of the depth of thought and vast amount of scientific knowledge which he possesses, and which are accompanied by a straightforwardness and consistency truly admirable.' A change of profession was in such a case inevitable, and few were surprised when, soon after being elected a member of the Royal Society in 1846, A., in conjunction with some friends, commenced the Elswick Engine-works. This establishment is upon a large scale, hitherto chiefly employed in producing hydraulic cranes, engines, accumulators, and bridges, for use in Great Britain, the continent, and India, but now embracing also works for the production of ordnance for the service of the government.

In 1854, while war was raging in the Crimea, the War-office was solicited by many inventors to make trial of new forms of cannon and projectiles. Mr. Armstrong, one of the number, attracted the attention of the authorities, and was employed to make explosive apparatus for blowing up the ships sunk at Sebastopol. This led him soon afterwards to consider improvements in ordnance, and he devised a form of breech-loading cannon, combining many peculiarities in structure and action. He received encouragement to make a few field-pieces on his new method. He made lengthened experiments on the strength of iron and steel, on the relative merits of cast and wrought iron, on the best number of grooves in rifling, on the best pitch or twist for those grooves, on the most convenient modes of loading at the breech of the gun, on the mechanism for lessening the recoil, on the best form and structure of shot and shells, and on the fuses best suited for igniting the shells during their flight.

Most of the early experiments were made with guns throwing 6-lb. and 18-lb. shot and shells, and subsequently 32-lb. shells, and this larger gun may be taken as a type of the whole. It is built up with small pieces of the very best wrought-iron, to avoid flaws or faults, and to insure strength, lightness, and durability. It is made in 3-feet lengths. Bars of wrought-iron, 2 inches wide, are heated to whiteness, twisted spirally round a steel bar or

core, and welded; other bars are twisted over these in a similar way, but with an opposite turn of the spiral; a third, and perhaps a fourth coating follow, according to the thickness and strength needed. Another heating to whiteness precedes a thorough welding of all the layers of bars by a steam-hammer. The ends of two of these 3-foot pieces are then nicely trimmed and adjusted, placed in contact, and bound together by the enormous pressure of a wrought-iron ring shrunk on while at a white heat. By varying the number and length of these sections, a gun of any length is made. The internal core is then removed, and the bore of the gun is rifled by exquisite machinery. The rifle-grooves are so small and close as to be upwards of 40 in number; their pitch or twist is such as to make a complete circuit in a gun 10 feet long. The breech of the gun is wholly distinct, and constructed in a different way; it can be drawn backward by unscrewing, and has a hole through its centre for introducing the shot or shell and the charge. At first, the inventor adopted a steel interior for his gun; but now he relies wholly on the toughest wrought-iron. The projectile employed with this gun may be solid shot, shell, case-shot, or canister-shot; but the shell is that to which most interest is attached. It is about three diameters in length; and thus a 32-lb. shot or shell can be fired from a gun of much smaller calibre than if it were spherical. The shell is built up of about 50 separate pieces of cast-iron, very accurately fitted, and enveloped in an iron sheath. Outside of it are two bands of lead, soft enough to be forced into the rifled grooves of the gun, and thus to acquire the rotary movement by which the straightness of flight is so much insured.

The actual results obtained by a gun such as is above described are almost incredible. An ordinary long 32-pounder weighs 57 cwt.; Armstrong's 32-pounder weighs 26 cwt. The former requires 10 lb. of powder as a charge; for the latter 5 lb. will suffice. The former will send a shot or shell 3000 yards; the range of the latter exceeds 9000 yards, or $5\frac{1}{4}$ miles. One particular A. gun has been fired 3500 times without exhibiting any flaw or failing—a feat never before even approached in gunnery. At 4000 yards' distance, a target 9 feet square can be hit 90 times out of 100. At 1000 yards' distance, the A. gun will hit *every time* an object so small as to be missed 56 times out of 57 by an ordinary 32 pounder, fired by the same gunner in the two cases. The fuses attached to the shells are so exquisitely adjusted that the shell can be made to burst either directly on leaving the gun, or half way on its path, or when it strikes an object; in the last-named case, even a sack of shavings will afford the necessary concussion; and yet, so close is the structure, that an uncharged shell has been fired completely through 9 feet of solid oak without the pieces separating. For naval use, the small diameter of the gun will allow small port-holes to be used, and thus lessen the danger to which the seamen-gunners are exposed. The gun-carriages, for ship or garrison use, have a sloping slide on which the gun runs *up* to lessen the recoil, and down which it runs again by its own gravity after firing. The shells to be directed against a ship are so formed, and provided with fuses of such a kind, as to explode exactly when striking the hull, and when the rent made will be most mischievous.

Although the wonderful effects of the A. gun relate chiefly to the 32 pounder, the principal experimental researches were made with one much smaller, but not less worthy of admiration. It had a bore of only $1\frac{1}{4}$ inch, and was light enough to be lifted about (without its carriage) by two or three men. It had eight spiral grooves, making one turn in 12 feet. When fired at a timber butt measuring

7 feet by 5, at 1500 yards' distance, this little gun propelled shot which hit the butt nearly every time, the average deviation from the centre of the butt being little more than 1 foot laterally; whereas an ordinary brass 6 pounder, which affords the nearest parallel as to weight, is perfectly useless at 1500 yards, and nearly so at 1000. At one particular elevation, the Armstrong shot, barely 2 inches in diameter, took the amazing flight of 3000 yards. The 32-pounder gun introduced many improvements on this little 6 pounder; and the inventor established the bases for further improvements in still larger specimens—up to 100 pounders, if needed.

When Mr Armstrong had spent much of his time and thoughts during four years on this subject, the government, supported by the strongly expressed opinions of artillery officers of all ranks, proposed to secure the result of these experiments for the nation. Mr Armstrong offered to the government, without any stipulation, not only all his past inventions, but also all such as he might hereafter discover. This led to arrangements which the ministers in parliament characterised as liberal and patriotic on his part; and the terms thus suggested by Mr Armstrong were accepted. An office was created for him, that of Chief-engineer of Rifled Ordnance, for seven years provisionally; and a certain amount of salary was determined on, in consideration at once of his past inventions and of his future services. Working arrangements have been organized at Newcastle-on-Tyne and Woolwich, which will render possible the production of many hundred guns per annum. Sir W. G. Armstrong (the honour of knighthood having been conferred on the inventor by the Queen) has pointed out reasons why foreign governments must necessarily be, for a lengthened period, unable to surmount the extreme mechanical difficulties of the manufacture of these guns.

ARMY, Referring to ARMIES (ANCIENT, MEDIEVAL, and MODERN) and to BRITISH ARMY for brief historical notices of national military forces, and leaving to other portions of this work all details concerning the formation and tactics of such forces, it may be well to mention here certain distinctions in the application of the name A. A *Covering A.* is encamped or in cantonments, for the protection of the different passes or roads which lead to the town or other place to be protected. A *Siege A.* is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *Blockading A.*, either independent of or auxiliary to a siege A., is intended to prevent all ingress and egress at the streets or gates of a besieged place. An *A. of Observation* takes up an advanced position, and by celerity of movement keeps a close watch on all the manœuvres of the enemy. An *A. of Reconnaissance* has a more special duty at a particular time and place, to ascertain the strength and position of the enemy's forces. A *Flying A.* comprises a strong body of horse and foot, moving quickly from place to place, to alarm the enemy, and to protect garrisons. Any one of these may be forced into an engagement in the field; but they are all more or less subsidiary to the *Main A.*, by which the greater operations in the field are usually conducted.

ARMY ADMINISTRATION. The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of the British army, are included in the term A. A. They are distinct matters from military command and discipline. The Sovereign has the supreme command of the British army; but the Secretary of State for War is her responsible representative in all that concerns administration—the Commander-in-chief being her

representative in matters relating to military organisation and discipline. The Secretary is the organ through whom the wishes of the Sovereign are reconciled with the wishes and intentions of parliament. Until the war with Russia in 1854, the administrative departments were much scattered; their defective organisation led in great part to the miseries suffered by the British troops in the Crimea; but now they are all consolidated under the Secretary of State for War. See WAR DEPARTMENT.

ARMY AGENT. See AGENT, ARMY.

ARMY ESTIMATES. In the spring of every year, the British government having formed a plan concerning the extent and appliances of the military force for that year, the War-office sends to the Treasury a series of accounts setting forth the probable cost of everything required. These accounts are called the A. E. If they are approved by the Treasury, the Chancellor of the Exchequer adverts to these, along with other estimates, in his annual 'financial statement,' made to the House of Commons in its capacity as guardian of the public purse. In preparing the A. E. the Secretary of State for War applies to the heads of all the departments under him for detailed accounts of their probable requirements. Another functionary then incorporates and adjusts these into a whole; they are submitted to the Treasury; and, if approved, are presented to the House as the A. E. Should the Commons grant the money, the Accountant-general of the War-office makes the requisite drafts or demands from time to time; and the Treasury authorises the Paymaster-general of the Forces to honour these drafts. The money itself is in the Bank of England; this establishment receives a certain annual sum from the government for managing such financial matters.

The A. E. are drawn up in conformity with a model which differs little from year to year. There are certain great headings, each comprising many minor divisions: viz., *Land Forces and Militia* (numbers, pay, allowances, and miscellaneous charges); *Civil Establishments* (administration, manufacturing establishments, civil departments); *Supplies* (clothing, provisions, forage, warlike stores); *Works and Buildings* (barracks, fortifications, &c.); *Educational Establishments* (schools, chaplains, libraries, &c.); *Non-effective Services* (half-pay, retiring allowances, pensions, &c.). These are not exactly the technical names of the several headings; but they will be more intelligible to general readers. The various items are more or less sifted by the House of Commons; and any one or more of them can be refused altogether, or granted in diminished amount. The A. E. for 1869-70, which may be cited here as an illustrative example, refer to the period from April 1, 1869, to March 31, 1870. The total number of British troops provided for in these estimates is 191,433; but as 63,707 are charged to the East Indian treasury, as being required for India service, the House of Commons was asked only to provide for the remaining 127,726. The horses are 24,069, of which 11,321 are for India service. Without going into any details, we will simply give the amounts under five great headings:

Military pay and allowances, . . .	£5,313,800
Commissariat, hospitals, &c. . . .	2,571,900
Militia reserve and voluntary corps, . .	1,537,200
Stores, works, surveys, &c.	2,624,700
Pensions, retired pay, &c.	2,182,800
	£14,230,400
For total effective service for 1869-70, .	£12,047,600
For total non-effective service for " "	2,182,800
	£14,230,400

ARMY LIST is the name of a publication issued by authority of the War-office. It contains the names of all commissioned officers in the British army, arranged according to the dates of their commissions. Then come the officers of the East India Company's service—or, *now*, that portion of the Queen's army which belongs exclusively to India. Next the names of all officers who hold military honours or staff appointments. The bulk of the work, however, is taken up with an enumeration of all the regiments in the Queen's army, and all the officers in each regiment in the Queen's army, and all the officers in each regiment, arranged according to the numerical rank of the regiments. To this are added lists of the officers of the Rifle Brigade, Colonial Corps, Royal Artillery, Royal Engineers, Royal Marines, Commissariat, and Army Medical Department; and of officers retired on full-pay and on half-pay. The A. L. for 1869 contains the names of little more than 6,500 commissioned officers. Another work of similar but non-official character, *Hart's A. L.*, by a more condensed arrangement of type, gives all the information contained in the official list, and much in addition.

ARMY SCHOOLS. The colleges, academies, and schools relating to military matters in this country may be grouped into two classes—those intended to increase the military efficiency of the officers and men; and those which bear relation to the ordinary school-tuition of soldiers of the ranks and their children. The principal of those in the first group are the Royal Military College at Sandhurst, the Royal Military Academy at Woolwich, the School of Instruction at Chatham, the Department of Artillery Studies at Woolwich, the School of Artillery at Shoebury, the School of Musketry at Hythe, and the Royal Artillery Institution at Woolwich. The chief among the second group are the Royal Military Asylum (better known as the Duke of York's School), the Regimental Schools, and the Garrison Schools. Chelsea College or Hospital is an asylum for veterans, not a school of instruction. Most of these educational establishments will be found most briefly described in this work, either under the names of the place where they exist, or of the arm of the service to which they belong.

ARMY WORKS CORPS. When the British generals engaged in the Crimean war, in the later months of 1854, knew that the siege-army would need to winter outside Sebastopol, grave difficulties were presented to their notice. The distance from the landing-place at Balaklava to the front of the siege-camp was not less than eight miles; and the only road was a mud-track, almost impassable in wet weather. How to get the heavy guns, the shot and shell, the provisions, and the general stores, up to the front, was a question not easy of solution. The British soldiers were too few even for the ordinary military duties, and yet they were called upon for services of an extra and arduous nature. When these facts became known in England, a suggestion was made that an 'Army Works Corps' should be formed, to consist of strong and efficient railway excavators, Cornish miners, and well-sinkers; that these should have with them all the tools and appliances for making roads and digging wells; and that they should be accompanied by travelling workshops and skilled artisans, to effect that which might require more skill than physical labour. The immediate necessities of Lord Raglan, in regard to bringing up supplies, were met by the construction of a railway from Balaklava to the heights outside Sebastopol, by special contract with Messrs. Peto and Brassey; but the large amount of bodily labour continually needed for various services, led to the formation of the A. W. C. The raising and

organisation of this force were intrusted to Sir Joseph Paxton. As soon as he had obtained 1000 efficient men, he sent them out; and their value was so soon felt by Lord Raglan, that other detachments gradually followed, until the corps comprised 3500 men in the latter months of 1855. The men were paid well, and they worked well; and as their engagement related only to the special duties connected with the siege camp, the country was not saddled with any burden after the need for these services had ceased. They did not require to be drilled for their duties, like sappers; and they were ready for work at once, as artisans or labourers. There were some cases of disagreement between the men and their employers, after the whole of the British had returned from the Crimea, in a matter of wages due; but this was a question of detail, and did not affect the usefulness of the corps. The experience gained has been valuable, as showing in what way, under special circumstances, ordinary workmen and labourers may be employed as assistants to a military force.

ARNAULD, ANGÉLIQUE, a daughter of Robert Arnauld d'Andilly, was born on the 28th November 1624. From her earliest years, she exhibited an extraordinary force and resoluteness of character, and excited much anxious speculation concerning her future career among her relatives. When not quite twenty years of age, she became a nun at Port-Royal des Champs, where she had been educated by her aunt, Marie Jaqueline Angélique Arnauld, sister of the great Arnauld. Nine years after, she was made subprioress; and on removing some years later to Port-Royal de Paris, she held the same office. During the persecution of the Port-Royalists, A. A., by her piety and courage, sustained the spirit of the sisterhood. The whole family, male and female, were determined Jansenists, and none more so than Mother Angélique de Saint Jean (her conventual name). She had much to endure, but she met misfortunes with earnest intrepidity. A royal order was issued to break up the nunnery. The police arrested the inmates, who were dispersed in various convents throughout France, and constant efforts were made by the Jesuits to induce them to sign the 'Formulary of Alexander VII.' A. A. was alone exempted from listening to their arguments and solicitations, her 'obstinacy' being supposed invincible. At length, by command of the Archbishop of Paris, the nuns were restored to Port-Royal des Champs; but for some years they were subjected to a strict surveillance by soldiers, who watched all their movements, and allowed them no intercourse with persons out of the convent. In 1669, however, was issued the edict of Clement IX. for the peace of the church, which was a kind of compromise on this vexed question of Jansenism and Jesuitism. The nuns received back the privileges of which they had been stripped, and constituted their society anew. A. A. was again elected prioress. In 1678, she was made abbess. The next year, her protectress, the Duchesse de Longueville, died, and the persecution recommenced, by the prohibition to receive any more novices. Still Angélique did not despair. She consoled the nuns, and exerted all her influence with persons in power, but with little effect. At last she sank under a complication of griefs, and expired on the 29th of January 1684, leaving behind her as bright and beautiful a memory as any of her countrywomen. She was learned without being pedantic, pious without bigotry, and gentle to others in proportion as she was severe to herself. A. A. wrote several works, the most valuable of which is *Mémoires pour servir à la Vie de la Mère Marie Angélique Arnauld de Sainte Madeleine, Réformatrice de Port-Royal*.

ARNAULD, ANTOINE, the greatest advocate of his time in France, was born at Paris in 1560. He was descended from an ancient family of Auvergne, which had distinguished itself both in civil and military affairs. A. was not less remarkable for his eloquence than for his probity. His zealous defence of the university of Paris against the Jesuits in 1594 won for him a wide celebrity. It was reprinted in 1717. He published another work against the Society of Jesus, and several tracts of an earnest political character. The Jesuits accused him of being a Huguenot, but the accusation was unfounded, for he had no personal predilection in favour of Protestantism as a distinct religious system. He had several children, who formed the nucleus of the Jansenists and Port-Royalists. He died 29th December 1619.

ARNAULD, ANTOINE, known as 'the great A.', the twentieth and youngest son of the preceding, was born at Paris, February 6, 1612. Although originally intended for the bar, he could not conceal his dislike of the legal profession, and was in consequence dedicated by his mother to the service of the church. Entering the Sorbonne, he became a pupil of Lescot, the confessor of Cardinal Richelieu, and afterwards Bishop of Chartres. Lescot initiated him into the scholastic theology; but his attention having been drawn to the writings of Augustine, he soon conceived an admiration for that profoundest of the early Christian thinkers, which he ever after retained. It was Augustine, he himself admitted, who first showed him the great difference between the two states—that of a nature whole and sound, and that of a nature corrupted by sin. In 1641, the Sorbonne wished to receive him into their society, on account of his extraordinary piety and talents; but Cardinal Richelieu opposed this. In the following year he was ordained a priest, and in 1643 he published a work entitled *De la Fréquente Communion*, which was received in the most favourable manner by all except the Jesuits, who had taken alarm at the virtues of A., and were already attempting to defame one whom they instinctively felt to be a reproach to their order. As a consequence of this publication, he was now admitted 'of the Society' of the Sorbonne. A. not only replied to the aspersions of the Jesuits in his *Avertissement*, but also sent forth a work which was the prelude to a long and fierce contest with his adversaries, *Théologie Morale des Jésuites* (Moral Theology of the Jesuits). But the hatred of the latter was not confined to literary libels; they advised the chancellor of the Sorbonne to carry the dispute to Rome, whither A. would be obliged to follow and defend himself. In this scheme, however, they were defeated.

A. now buried himself in seclusion for twenty-one years, during which period, however, his pen was almost continuously active. In 1644 appeared his *Tradition de l'Eglise sur la Pénitence* (Opinion of the Church on the Doctrine of Penitence). It was a reply to the attacks which the Jesuits had made against his *Frequent Communion*. A. was still entangled in the disputes which arose out of this treatise, when he became involved in another controversy that coloured the whole of his subsequent career, and may be said to have won for him his position in history. This was the great Jansenist controversy. In 1640 had appeared a posthumous work of Jansenius, Bishop of Ypres, entitled *Augustinus; seu Doctrina Sancti Augustini de Homine Naturæ Sanctitatis, Libertatis, Medicinæ, adversus Pelagianos et Massilienses*. It laid down with a rigour equal to that of Calvin the doctrines of predestination, the corruption of human nature, and the depravity of the will. It was specially intended as a counteractive against the lax principles and

morality of the Jesuits, many of whom, and especially their great champion, Molina, entertained extreme Pelagian views of the freedom of the human will, which they had cunningly interwoven into their 'scarlet-colored' web of ethics. The work, in the meantime, was condemned by Pope Urban VIII., on the 1st of August 1641. A., who quickly apprehended its vital importance in the existing state of things, boldly ventured to defend it against the censures of the papal bull. He published several pamphlets, closing with a first and second *Apologie de Jansénius*. It is to the honour of the religion of A., however, that it was not always controversial. Whenever a moment of armistice was permitted him, he occupied it in writing such works as *Mœurs de l'Eglise Catholique*, *La Correction*, *La Grâce*, *La Vérité de la Religion*, *De la Foi*, *de l'Espérance*, *et de la Charité*, and the *Manuel de Saint Augustine*. He also varied these occupations by translating into Latin his *Frequent Communion*, and by the composition of his *Novæ Objectiones contra Renat. Descartis Meditationes*, and several smaller tractates. In addition to his literary labours, he undertook the direction of the nuns of Port Royal des Champs, a convent of which his sister, Marie Jaqueline Angélique Arnauld, was abbess. In his retreat he was surrounded by many friends, thirsting like himself for the quiet pleasures of study, some of whom have left their mark in the world, such as Pascal, Nicole, &c. Here they wrote in common numerous excellent works. A. executed parts of the *Grammaire Générale Raisonnée*, *Eléments de Géométrie*, and *L'Art de Penser*. In 1649 the Jansenist controversy broke out more fiercely than ever. The *Augustinus* of the Bishop of Ypres was again attacked and condemned by the Sorbonne and the pope. A. replied in his *Considérations*. In 1650 appeared what he conceived to be his best work, *L'Apologie pour les Saints Pères*. For the next half dozen years he was engaged in constant and painful disputes; yet, in spite of the polemical character of his life, the impression of his piety and earnestness was deepened in the mind of the nation; and on reading some of his compositions, even Alexander VII. is reported to have praised the author, and to have exhorted him for the future to despise the libels of his adversaries. During the strife he published *La Concorde des Evangiles* and *L'Office du Saint-Sacrement*. In 1655–56, for prudential reasons, he left his retreat at Port-Royal; about the same time he was expelled from the Sorbonne and the faculty of theology.

In 1656, the war with the Jesuits was renewed—not, however, by A. in person. An unknown knight with closed visor had ridden into the lists—the great Pascal. Under the nom de plume of Louis de Montalto, he discharged his scorpion wit against the Jesuits for about a year and a half in the *Provincial Letters*. A. furnished him with materials; but, in 1658, he took the field in *propria persona*, by publishing his *Cinq Ecrits en faveur des Curés de Paris contre les Casuistes relâchés*. In 1662 appeared *La Nouvelle Héresie* (of the Jesuits); in 1669 the first volume of his *Morale Pratique* (of the Jesuits), the last of which was not published until the year of his death.

A., who was a sincere Catholic after his fashion, next had a theological controversy, properly so called, with the reformed minister Claude, the consequence of which was his volume, *Du Renversement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification* (1672). In 1675 he returned to the subject in his *Impiété de la Morale des Calvinistes*. Some years previous to this, A. had enjoyed the peace of Clement IX., which put a stop for the time to the Jansenist controversy. He had been presented to the papal nuncio and to the *Grand Monarque*, both of whom flattered him highly; but

the Jesuits, who could not breathe freely in his presence, used their utmost efforts to prejudice Louis against him, and at last the king issued an order for his arrest. A. hid himself for some time, but finally withdrew into Belgium. He felt his exile keenly, though honoured by many learned and influential persons, and could not rest in one city, but wandered from place to place, ever displaying the same astonishing vigour of mind and the same polemical tendency. It is strange that this man, who was celebrated amongst his friends for equanimity and gentleness of heart, should have been so bitter in his controversies, even with his friends, for he wrote not against his enemies only, but against Pascal, Domat, Nicole, his protector, Pope Innocent XI., and his old friend Père Malebranche. So earnest was he for the truth—which earnestness had no doubt been greatly intensified by persecution and controversy—that he could never thoroughly realize the idea, that there might be truth on the other side also. He died at Brussels, 8th August, 1694. His works, which amount to upwards of 100 volumes, were published at Paris, 1775–1783.

ARNAULD, ROBERT D'ANDILLY, the eldest son of Antoine Arnauld, the advocate, and brother of the great Arnauld, was born at Paris in 1588. He was a person of considerable consequence at the French court, where his influence was ever exerted beneficially. Balzac spoke very highly of him. At the age of fifty-five, he quitted the bustle of the world for the solitude of Port-Royal des Champs, where he devoted himself to religious history and biography. His chief works are translations, such as those of the *Confessions of St. Augustine*, and of the *History of the Jews*, by Josephus. The latter work is esteemed more elegant than accurate, however. In 1668, appeared the translation of the *Lives of the Holy Fathers of the Desert*, and of *several Saints*; and in 1670, that of the works of St Theresa. He was likewise the author of some pieces of religious verse. He died 27th September 1674.

ARND, a German Protestant clergyman, born at Ballenstadt, in the duchy of Anhalt, in 1555, became Lutheran pastor at Quedlinburgh, Brunswick, and elsewhere, and died at Celle, in Hanover, in 1621. As a man, he was remarkable for his piety and active benevolence; but he is chiefly known for a work entitled *True Christianity* (*Wahres Christenthum*), which was translated into most European languages, and is yet popular in Germany. Its object is 'edification'—the promotion of practical religion; and it is written with great warmth and unction, and in a strain of piety bordering on mysticism. It has been called the Protestant à Kempis, and its author the Fenelon of the Protestant Church. There is an English translation by W. Jaques (Lond. 1815, 2 vols.).

ARNDT, ERNST MORITZ, professor in the university of Bonn, and for the last half century one of the leading political writers of Germany, was born in the island of Rügen in 1769. He gave up the clerical profession, for which he was first intended, and after travelling over great part of Europe, became, in 1806, Professor of History in Greifswalde. Here, among other writings, he published his *History of Serfdom in Pomerania*, for which he was formally denounced and accused by several nobles. In his *Spirit of the Times* (Altenb. 1807), he attacked Napoleon with such boldness, that, after the battle of Jena, he had to take refuge in Stockholm. Returning under a feigned name, he resumed his functions at Greifswalde in 1810; but war becoming imminent, he resigned the following year, and became an active co-operator with the minister, Von

Stein, and other patriots, in throwing off the foreign yoke. His numerous fugitive writings, full of energy and fire, contributed not a little to rouse and sustain the spirit of Germany for the war of liberation. His best poems belong to this period, and several of them have become national songs. (A new selection, Leip. 1850.) His song, *What is the German's Fatherland?* is sung wherever German is spoken. In 1818 he was made professor of modern history in the new university of Bonn, but became involved in 1819 in the prosecutions for what were called 'demagogic movements,' and was suspended. Though acquitted on trial, he was made to retire, retaining his salary. After twenty years' suspension, he was restored in 1840. His writings are numerous: we may mention his *Beschreibung und Geschichte der Schottland, Inseln, &c.* (Leip. 1826); a collection of his fugitive *Schriften an und für seine Liebe Deutschen* (3 vols. Leip. 1845); and *Erinnerungen aus dem äussern Leben* (3d ed. Leip. 1842). He was elected a member of the German national assembly in 1848, but seceded from it along with the whole Gagern (q. v.) party in 1849. He powerfully supported the party who advocated a constitutional hereditary monarch, and took a prominent part in the appointment of the Archduke John as regent, and in the fruitless deputation to Berlin to offer the empire to the King of Prussia. After the dissolution of the Frankfort Assembly, A. continued to advocate the views of the German national party, to which he always belonged. He died Jan. 30, 1860.

ARNE, THOMAS AUGUSTINE, Doctor in Music, one of the best and most genial of English composers, was born in London, 1710, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar; but the love of music was too strong to be restrained. Young A. became skilful as a violin-player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterwards celebrated as Mrs. Cibber) to cultivate her excellent voice. He wrote for her a part in his first opera, *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas*; and afterwards his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1740); and after a successful visit to Ireland, was engaged as composer to Drury Lane Theatre, and wrote many vocal pieces for the Vauxhall concerts. The national air, *Rule Britannia*, which was originally given in a popular performance, *The Masque of Alfred*, was of his composition. He composed also two oratorios, the opera *Eliza*, and another, *Artaxerxes*, in the Italian style; but his genius was better adapted to simple pastoral melody than to great dramatic compositions. He died in London, 1778.

ARNEE, or ARNA, the largest animal of the ox kind yet known. It is a native of India,

and is found chiefly in the forests at the base of the Himalayas and in the north-eastern provinces, never descending to the low plains. It is usually regarded by naturalists as a wild variety of the buffalo; but Mr Vasey thinks 'our information on the subject not yet sufficiently precise

Arnee.

(From an Indian picture.)

to determine this point.' It is named *Dos Arnee*, as a distinct species, by some authors. A pair of horns in the British Museum measure more than six feet each along the outer curve. When the head of an A. is placed with the muzzle on the ground, it requires the outstretched arms of a man to hold the points of the horns. From the manner in which the A. is introduced in Indian paintings, it would seem to have been sometimes tamed.

ARNHEIM, or ARNIEM, the Roman Arenacum, capital of the province of Guelderland, in Holland, with a population of 18,000, is situated on the right bank of the Rhine, which is here crossed by a bridge of boats; it has a considerable transit-trade between Amsterdam and Germany. The environs of this strongly fortified town are exceedingly picturesque. Its most remarkable buildings are the ancient residence of the Dukes of Guelderland, and the Reformed Dutch Church, which contains their monuments. There are several paper-mills in the neighbourhood. In 1813, A. was taken by storm by the Prussians, under General Bulow, and the way thus prepared for the occupation of Holland.

ARNHEM LAND, that part of North Australia which lies between Anson Bay on the west and the Gulf of Carpentaria on the east, stretching in E. long. from about 129° to about 137°; in lat. it extends indefinitely southwards from about 12° S. It takes its name from the ship of the Dutch navigators who discovered it in 1618.

ARNICA, a genus of plants belonging to the natural order *Compositæ*, sub-order *Corymbifera*. The flowers of the ray are female and ligulate, those of the disk hermaphrodite and tubular. The receptacle is naked; the pappus hairy. The root, leaves, and flowers of the Mountain A. (*A. montana*), sometimes called Mountain Tobacco, are much valued in medicine, and administered in various forms as a stimulant in paralytic affections, typhoid fevers, and other diseases. They are also applied with much benefit to bruises, to promote the reabsorption of extravasated blood. They contain a peculiar volatile oil, a resin, an extractive matter, and an alkaloid (*Arnica*). The root is perennial and crooked, the stem about two feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often

Skull and Horns of Arnee.

two inches in breadth. It flowers from June to August, forms an ornament of mountain meadows

Arnica montana.

in Germany and Switzerland, and is found upon the continent as far south as Portugal, and as far north as Lapland, but is not a native of Britain.

ARNIM, ELIZABETH VON, better known as Bettina, wife of Ludwig Achim von Arnim (q. v.), was born in 1785 at Frankfort-on-the-Maine. From her childhood excitable and eccentric, an early and profound impression was made upon her mind by the suicide of her friend, the Canoness von Gunderode. The next great event of her life was her devoted attachment to, and intimacy with Goethe, at that time a man of nearly sixty. Their correspondence, entitled *Goethe's Letters to a Child*, was published in 1835, and translated by Bettina into English. Her letters are poetical, graceful, and fascinating, though often careless and extravagant, and abound in graphic sketches of men of the time. Goethe turned many of these letters into verse. Bettina's later works were semi-political in their character, and like her earlier, full of fantastic beauty. Although a septuagenarian, she appears to be still Bettina 'the child.'

ARNIM, KARL OTTO LUDWIG VON, a well-known writer of travels and other works, was born at Berlin 1779. After studying at Halle and Göttingen, he travelled at different times over the most of Europe, and was employed on the embassies at Stockholm and London. His *Flüchtige Bemerkungen eines flüchtigen Reisenden* (Passing Remarks by a Passing Traveller, 6 vols., Berl. 1837—1850), is recommended for its clear elegant style, as contrasted with the lumbering and involved writing of the 'Academic' school. A. also wrote in English *Napoleon's Conduct towards Prussia* (Lond. 1814), and published *German National Melodies*, with German and English text (Lond. 1816). He is the author of a play and several poems.

ARNIM, LUDWIG ACHIM VON, a fantastic but original German writer of romances, was born in

Berlin, January 26, 1781. After devoting some years to the study of the physical sciences, he began his career as an imaginative author with *Ariel's Revelations*, a romance which, though based on the principles of the new poetic school which had then risen in Germany, indicated, nevertheless, that the author could strike out a way of his own. His travels through Germany afforded him an opportunity of catching the peculiarities of popular life in its various provincial manifestations. He was especially interested in the old popular poetry, and stirred up among his countrymen a warmer sympathy for it by the publication, along with Clemens Brentano, of *The Boy's Wunderhorn* (Heidelberg, 1806—1808). In 1809 appeared the *Winter Garden*, a collection of novels; in 1810, the romance, entitled, *The Poverty, Riches, Guilt, and Repentance of the Countess Dolores*; in 1811, *Halle and Jerusalem, the Sports of a Student*, and *The Adventures of a Pilgrim*, in which last his humour took a very saucy turn. In 1817, he published the *Crown Guardians*, a work characterised by its originality, richness of fancy, and vivid portraiture. The later years of his life were spent partly in Berlin and partly at his estate near Dahme, where he died, Jan. 21, 1831.

ARNO, next to the Tiber the most considerable river of Central Italy, rises on Mount Falterona, an offshoot of the Apennines, at an elevation of 4444 feet above the level of the sea, and 25 miles north of Arezzo. It flows through the deep and fertile valley of Casentino, in a south-east direction; enters the richly cultivated plain of Arezzo, where it receives the water of the Chiana; then flows in a north-west and north course through the upper valley of the A. (*Valdarno*), one of the most delicious parts of Tuscany; afterwards it receives the Sieve, its largest tributary, and turns its course toward the west, flowing past Florence, Empoli, and through the town of Pisa. The whole length of its course is about 140 miles. In old times, the embouchure of the A. was at Pisa; now it is about four or five miles distant, in lat. 43° 41' N., and long. 10° 15' E. It is navigable for barges as far up as Florence, but in the summer season even this frequently becomes impossible. The Italian poets speak of 'the golden A. ;' but, in truth, its waters have mostly the unpleasant colour of milk and coffee mixed together. The A. is noted for the rapid and destructive character of its inundations. The most memorable are those of September 1537, when the whole of the Valdarno was laid under water, which rose to the height of 8 feet in some parts of Florence; and of 1740, the latter being caused by the long continuance of the sirocco, which completely melted the snows on the Apennines.

ARNOLD, or ARNALD, OF BRESCIA, was a native of that town, and was distinguished by the success with which he contended against the corruptions of the clergy in the early part of the 12th c. He was educated in France under Abelard, and adopted the monastic life. By his preaching, the people of his native place were exasperated against their bishop, and the fermentation and insurrectionary spirit spread over a great part of the country, when he was cited before the second Lateran Council, and banished from Italy. He retired to France, but experienced the bitter hostility of St. Bernard, who denounced him as a violent enemy to the church. He thereupon took refuge in Zurich, where he settled for several years. Meanwhile his doctrines exerted a powerful influence in Rome, which ended in a general insurrection against the government, whereupon A. repaired thither, and endeavoured to lead and direct the movement. He exhorted the people to organise a government similar

to the ancient Roman republic, with its consuls, tribunes, and equestrian order. But they, provoked by the treachery and opposition of the papal party, and disunited among themselves, gave way to the grossest excesses. The city, indeed, continued for ten years in a state of agitation and disorder. Lucius II. was killed by the populace in an insurrection in 1145, and Eugenius III., to escape a similar fate, fled into France. These violent struggles were subdued by Pope Hadrian IV., who, feeling the weakness of his temporal authority, turned to the spiritual, and resorted to the extreme measure of laying the city under excommunication, when A., whose party became discouraged, and fell to pieces, took refuge with certain influential friends in Campania. On the arrival of the emperor, Frederick I., for his coronation, in 1155, A. was arrested, brought to Rome, tried, hanged, his body burned, and the ashes thrown into the Tiber.

ARNOLD, JOHANN, a miller of Newmark, who lived in the time of Frederick II. of Prussia, and gave rise to a remarkable legal process. He complained to the king that his landlord, by making a pond, had taken away water from the mill; that he (A.) had therefore refused to pay rent for the mill, of which he held a lease; but had been condemned to pay by the unanimous decisions of two legal courts. The king took up the case, and regarding it as an oppression of the poor, reversed the decisions of the courts, dismissed his high-chancellor, imprisoned several other officers of justice, and gave orders that restitution should be made to the miller. Soon afterwards, the king died, and under Frederick William II. the case was more coolly investigated, when the result was that the condemned chancellor and other official persons were exonerated from all blame in the matter, and the miller was recompensed by the state for loss of time and money.

ARNOLD, MATTHEW, a living English poet, the eldest son of the late Dr. Arnold of Rugby, was born on the 24th December 1822, and educated at Winchester and Rugby. In 1840 he was elected scholar of Balliol College, Oxford; in 1844 he obtained the Newdegate prize for an English poem; in 1845 he was elected a fellow of Oriel College; and in 1846 he became private secretary to Lord Lansdowne, which office he held for several years. In 1851 he espoused Frances, daughter of Mr. Justice Wightman, and about the same time was appointed one of Her Majesty's Inspectors of British Schools. Two years ago, he was elected Convocation Professor of Poetry at Oxford. Mr. A. has been before the world now as a poet for several years, and his success has been considerable. Although he has not achieved popularity, his position in literature is established, and as his works become better known, admiration for them will increase. If he has failed to obtain the applause of the noisy many, he is rewarded by the approval of the judicious few. The strain of his mind is calm and thoughtful; his style is the reverse of florid; deep culture and a certain severity of taste have subdued every tendency to a gay or a passionate exuberance. As a poet, he has little sympathy with the present; his muse has hitherto delighted in the remoteness and repose of the ancient world. In his eloquent and voluminous prefaces, he advocates the return of poetical art to the antique forms. Mr. A. practises his own creed. The story of Sohrab and Rustum is as old as Herodotus. *Balder*, a later production, and as yet his most considerable poem, is a story of the Norse gods; and his tragedy of *Merope* is an attempt to naturalize in English literature the form of the Greek drama—an attempt induced, says its author, 'by a passion for the great masters, and an effort to

study them without fancifulness.' In 1865 he published *Essays in Criticism*.

ARNOLD, THOMAS, D.D., head-master of Rugby School, and the author of a *History of Rome*, was born June 13, 1795, at West Cowes, in the Isle of Wight. In 1803 he was sent to Warminster School, in Wiltshire, but was removed in 1807 to the public school of Winchester, where he remained till 1811, when he was elected a scholar of Corpus Christi College, Oxford. In 1815 he was elected fellow of Oriel College, and he gained the chancellor's prize for the two university essays, Latin and English, for the years 1815 and 1817. As a boy, we are told he was shy and retired; as a youth, disputatious, and somewhat bold and unsettled in his opinions; but before he left Oriel, he had won the good opinion of a college which at that time boasted of such names as Copleston, Davison, Whately, Keble, Hawkins, and Hampden. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he occupied himself in preparing pupils for the university. In 1820 he married Mary, youngest daughter of the Rev. John Penrose, rector of Fledborough, in Nottinghamshire, and sister of one of his earliest school and college friends, Trevenen Penrose. About ten years were spent in this quiet and comparatively obscure life; he was preparing himself for the arduous post he afterwards occupied; he was maturing his opinions, and he had also already commenced his great literary undertaking, the *History of Rome*. It was a period which he himself was accustomed to look back upon with some feeling of regret. His letters at this epoch reveal to us a fine ambitious spirit bending cheerfully to the task of tuition, more useful than glorious; they also prove to us that those views of a religious and political character which afterwards distinguished him, were being matured in the privacy of Laleham. 'I have long had in my mind,' he thus writes to a Mr. Blackstone, 'a work on Christian politics, or the application of the Gospel to the state of man as a citizen, in which the whole question of a religious establishment, and the education proper for Christian members of a Christian commonwealth, would naturally find a place. It would embrace also an historical sketch of the pretended conversion of the kingdoms of the world to the kingdom of Christ in the 4th and 5th centuries, which I look upon as one of the greatest *tours d'adresse* that Satan ever played. . . . I mean that by inducing kings and nations to conform nominally to Christianity, and thus to get into their hands the direction of Christian society, he has in a great measure succeeded in keeping out the peculiar principles of that society from any extended sphere of operation, and insuring the ascendancy of his own.' He here expresses, in a somewhat sportive and familiar manner, the great principle which he afterwards contended for with so much earnestness, that there should be a Christian laity, a Christian legislature, a Christian government; by which he did not mean a system of laws or government formed in the manner of the Puritans, out of texts of Scripture, rashly applied, but imbued with the *spirit* of the New Testament and of the teaching of Christ.

It was at Laleham also that A. first became acquainted with Niebuhr's *History of Rome*. This was an era in his life. It produced a revolution in his historical views, and his own *History of Rome* became modelled almost too faithfully on that of the great German.

From Laleham he was called to undertake the arduous duties of the head-mastership of Rugby School. On these he entered August 1828. Our space does not permit us to dwell upon the details of that system of public education which he perhaps

carried to its perfection. We can only take notice of the high tone, moral and religious, which he preserved amongst the boys. He had the tact to make himself both loved and feared. He guided with great dexterity the *public opinion of the school*. 'In the higher forms,' says his biographer, 'any attempt at further proof of an assertion was immediately checked. "If you say so, that is quite enough; of course I believe your word;" and there grew up in consequence a general feeling that it was a shame to tell A. a lie—he always believes one.' On one occasion, when he had been compelled to send away several boys, he said: 'It is not necessary that this should be a school of 300, or 100, or of 50 boys, but it is necessary that it should be a school of Christian gentlemen.'

But the school was very far from occupying the whole energies of A. The *History of Rome* went on; he took part in all the great questions of the day, political and theological. In politics he was a Whig, without being fettered—as we need hardly say—by the ties of party. In the theological discussions of the day, he was chiefly distinguished by the broad views he had adopted of the nature of a Christian church. As already intimated, it was his leading idea that a *Christian people* and a *Christian church* ought to be synonymous expressions. He would never tolerate that use of the word church which limited it to the clergy, or which implied in the clergy any peculiar sacredness, or any traces of mediatorial function. The priest was unknown to him in the Christian community; this placed him at once in antagonism to the High Church party; and even clergymen of the Low Church complained that he did not set sufficient value on their sacred order. But all men, of whatever party, admitted and admired the zeal with which he taught that the full spirit of Christianity should permeate the whole of our civil or political life. If he seemed to lower the altitude of the clergy, it was only because he would raise the general level of the laity. He was convinced that 'the founders of our present constitution in church and state did truly consider them to be identical, the Christian nation of England to be the church of England; the head of that nation to be, for that very reason, the head of the church.' It may be doubted whether this is quite historically correct; but it certainly presents a noble theory to the imagination.

In domestic life, Dr. A. was most happy; here he was distinguished by unflinching cheerfulness and amiability. In 1832, he purchased Fox How, a small estate between Rydal and Ambleside, and it was in this charming retreat that he enjoyed in the vacations, amongst the family circle, his own uninterrupted studies. Fox How has become a classical spot to every tourist.

For a brief time he held a place in the senate of the London University; he resigned the seat on finding that he could not introduce some measures which he had at heart. In the year 1842, he received from Lord Melbourne the offer of the Regius Professorship of Modern History at Oxford. This appointment he accepted with peculiar gratification. He delivered some introductory lectures, which were heard with enthusiastic interest; and it was his intention, on his retirement from Rugby, to enter with zeal upon the duties of his professorship. But this and all other literary enterprises were cut short by a sudden and most painful death. The last vacation was at hand, the journey to Fox How was to be taken in a few days, when he was seized with a fatal attack of spasm of the heart. Few biographies end more abruptly or more mournfully; but the sufferer met his death

with perfect fortitude and the full hope of a Christian. He died June 12, 1842. His principal works are *five volumes of sermons*; the *History of Rome* (3 vols.), broken off by his death at the end of the second Punic war; and an *edition of Thucydides*. His miscellaneous contributions to literature are too numerous to be mentioned.

ARNOTT, NEIL, M.D., was born in 1788 at Arbroath, but his family-home was Dysart, near Montrose, Scotland. He was educated at the Grammar School of Aberdeen, and subsequently at Marischal College in the same city, where he had the advantage of studying natural philosophy under Professor Copland, one of the most successful expounders of mechanical science then living. A. made choice of medicine as a profession; and after going through the medical course at Aberdeen, he went to London in 1806, where he became the pupil of Sir Everard Home, surgeon of St. George's Hospital. After spending some years in the naval service of the East India Company, he settled in 1811 as a medical practitioner in London, where he has lived ever since. In addition to his extensive general practice, A. was appointed, in 1815, physician to the French embassy, and afterwards to the Spanish embassy. In 1836, Dr. A. was appointed a member of the Senate of the University of London, then established by government. He was afterwards elected a fellow of the Royal Society, and then of the Geological Society. In 1837, he was named a Physician Extraordinary to the Queen. He has recently retired from practice.

In 1823–24, Dr. A. was induced to deliver a course of lectures on natural philosophy in its applications to medicine. The substance of these lectures formed the basis of his *Elements of Physics, or Natural Philosophy General and Medical*, published in 1827. Owing to the professional occupation of the author, the second part of the second volume was never completed; nevertheless, the work enjoyed immense popularity, and five editions were called for in six years. Since 1833, the work has not been republished, but a new and complete edition is understood to be in progress. Of numerous new applications of physical science to medical practice, and to the alleviation of human suffering in general, invented by Dr. A., may be mentioned the water-bed (q. v.). But it is in connection with improvements in the warming and ventilating of houses that the name of Dr. A. is most extensively known. In 1838, he published a treatise on *Warming and Ventilating*; and in 1855, another, *On the Smokeless Fireplace, Chimney-cases, &c.* The 'Arnott Stove' and 'Arnott Ventilator,' which, with characteristic philanthropy and disinterestedness, Dr. A. refrained from patenting, will be noticed under STOVES and VENTILATORS.

ARNOTTO, ARNA'TTO, ANNOTTA, ANNA'TTO, or ROUCOU, also known on the continent of Europe by the name of ORLEAN, is a red colouring matter which is obtained in South America and the West Indies from the reddish pulp surrounding the seeds of the Arnotto-tree (*Bixa orellana*) by washing, maceration, fermentation, and subsequent evaporation. It appears in commerce in cakes or balls of 2–4 lbs. weight, wrapped up in leaves, externally brown, internally of a pale blood-red or yellowish-red colour, and which have a peculiar animal smell and an astringent taste. Pure A. seldom appears in the market. It is obtained by the mere rubbing off and drying of the red pulpy pellicle which covers the seed; but that which is thus obtained is very pure, and occurs in small round or angular lozenges. The Indians rub this colouring matter into the skin of their whole body, thus intending both to adorn

themselves, and to obtain protection against the bites of mosquitoes. Amongst us, *A.* is used in medicine for colouring plasters, ointments, &c.; and to a considerable extent by farmers for giving a

Arnatto:

a, end of a branch with leaves and flowers reduced; *b*, capsule; *c*, the seeds and pulp.

rich colour to cheese. It is also used in dyeing, although it does not produce a durable colour. It is employed to impart an orange tint to simple yellows. It is an ingredient in some varnishes. It dissolves in alkalies, producing a brown solution, from which it is precipitated yellow by acids. It imparts little colour to water, but dissolves in alcohol; alum and sugar of lead throw down a brick-red precipitate from the alcoholic solution. In South America, *A.* is very extensively mixed with chocolate, not only for the sake of the colour, but also for the improvement of the flavour.—The genus *Bixa* belongs to the natural order FLACOURTIACEÆ (q. v.), and is distinguished by complete flowers with simple stigma, a hispid calyx of five sepals, and a two-valved capsule. The *A.* shrub is a native of tropical America, but has been introduced into other warm countries. It grows to the height of 7—8 feet, and has heart-shaped pointed leaves, and large flowers of a peach-blossom colour, which grow in loose clusters at the extremity of the branches. The capsules are oblong, and contain 30—40 seeds enveloped in red pulp (the *A.*). The seeds are said to be cordial, astringent, and febrifugal. The roots are used in broth. They have the properties of *A.* in an inferior degree.

ARNSBERG, one of the three departments of the Prussian province of Westphalia (q. v.), having an area of 2900 square miles, and a pop. (1861) of 703,256. With the exception of the valley of the Lippe, the whole department belongs to the highlands of the Lower Rhine. Only in a few of the valleys is there good arable soil; on the other hand, there is a great deal of good timber, more than a third of the whole area consisting of forests. But the principal resources of the district are its subterranean riches, in coal, iron, lead, silver, &c. Its abundant water-power has also led to the establishment of numerous factories, mills, &c. ARNSBERG, the chief town of the department, is situated on the Rhur, 44 miles south-east from Münster; pop. 4500. It has several manufactures, such as linen, broadcloth, potash, &c. In the orchard below the castle is still pointed out the

spot where the famous Fehmgericht (q. v.) of *A.* was held.

A'RNSTADT, the chief town in the principality of Schwarzburg-Sonderhausen, is situated in a picturesque country on the banks of the Gera, twelve miles south of Erfurt, and has a population of 5820. It is one of the oldest Thuringian cities, its existence being traceable as far back as 704 A.D. Formerly it was the chief emporium for the trade in fruit and timber between the fertile lowlands and the Thuringian forest region, but is now a manufacturing town, employing a very considerable number of hands in weaving, glove-making, brewing, pottery, &c. A rich vein of rock-salt has been recently discovered in the neighbourhood of the town, and a new copper-mine opened.

AROMA, a term sometimes employed to designate those substances the extremely minute particles of which are supposed to affect the organ of smell so as to produce particular odours, and frequently as synonymous with *odour*. The particles diffused through the atmosphere, and affecting the olfactory nerves—if the theory of particles of matter so diffused be correct—must indeed be extremely minute, as odoriferous substances such as musk, the smell of which is felt at a considerable distance, continue to diffuse their odour, and according to this theory, these particles, for years, without sensible diminution of weight. See SMELLING. The term *A.* is usually employed only with reference to particular kinds of odours, not easily defined or distinguished in words. Thus, we speak of the *A.* of roast-meat, and of the *A.* or *aromatic* smell of hyssop, mint, and other plants. Aromatic smells are very characteristic of some natural orders of plants, as *Labiata* (Mint, &c.) and *Compositæ* (Millefol, &c.). They have been very generally supposed to depend upon essential oils, but resins are often equally aromatic.

AROMATIC VINEGAR differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, and *Acorus Calamus* (and sometimes camphor) to crystallisable acetic acid, or by distilling the acetate of copper in an earthen retort and receiver, and treating the liquid which passes over with the fragrant oils mentioned above. *A. V.* is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils, is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. *A. V.* is generally placed on a sponge in a smelling-bottle or in a *vinai-grette*; it can also be purchased as a liquid in phials; and a drop or two allowed to evaporate into a sick-room, overpowers, but does not destroy any unpleasant odour. The liquid must, however, be cautiously dealt with, as it is a very corrosive substance.

ARONIA. See CRATEGUS.

AROO'STOOK, a river which, rising in the north of Maine, falls into the St John in New Brunswick, after a course of about 120 miles. It possesses a historical interest from its connection with the long-aggitated question of the north-east boundary between British America and the United States.

ARPAD, the national hero of Hungary, was the son of Amos, the leader under whom the Magyars first gained a footing in Hungary. He was chosen duke on his father's death in 889, and by a course of incessant and mostly successful warfare with the Bulgarians, Wallachians, Moravians, &c., extended the first conquests of the Magyars on all sides. He also made more than one successful incursion into

Italy about 900, and returned laden with booty. He died in 907, leaving his son in possession of the supreme command. The A. dynasty became extinct in the male line with Andreas III. in 1301. A. yet lives in the popular songs of the country, and his history, even in the oldest chronicles, is mixed up with a deal of legendary matter.

ARPEGGIO, in Music, a chord of which the notes are given, not contemporaneously, but in succession. From any one chord, several forms of A. may be produced. Bass-chords thus treated form an *Alberti Bass*, so named from Domenico Alberti (1730—1740), a popular singer and player, who often played the bass in this style.

ARPENT was the old French land-measure, corresponding to our acre. The name is from the ancient Gallic *aripennis*, which was identified by Columella with the Roman *actus*, or half *jugarum*. Almost every parish had an A. of its own. The comparative value of the three most in use will be seen in the following table:

	French Hectares.
Acre, English, imperial or statute, . . .	0.40466
Arpent, of Paris, . . .	0.32400
“ d’ordonnance, . . .	0.48450
“ common, . . .	0.40000

ARPI’NO, the Arpinum of the ancients, a town of the kingdom of Naples, the birthplace of Cicero and Caius Marius, is situated in the province of Terra di Lavoro, 65 miles north by east of Naples. It stands on the lower ridge of a lofty hill, some 6 miles to the left of the river Garigliano, the ancient Liris. The old town, in early Roman times, was built on the top of a steep rock, forming part of the territory of the Volscians. Many remains of the ancient structures are still to be seen, especially a cyclopean wall, which runs along the northern brow of the hill occupied by the present town, and extending to the ancient citadel. About the year 188 B.C., the citizens received the freedom of the city of Rome, with all its privileges, and Arpinum, during the later years of the republic, was a flourishing municipal town.

The population of A. is 12,648. Manufactures of woollen cloth, parchment, paper, and leather are carried on. The town has a charming appearance from the highly picturesque character of the surrounding woods and mountains. Iron, white marble, variegated red marble, and marble of a yellowish colour, are got in mines and quarries in the neighbourhood.

A’RQUA, a village in the delegation of Padua, Venice, 12 miles south-west of Padua, in the heart of the Euganean Hills. Pop. 1200. Petrarch’s furniture is still preserved in the house in which he died here (July 18, 1374), and the monument of red marble is to be seen in the churchyard.

A’RQUEBUS, or HA’RQUEBUS, was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the A. Many of the yeomen of the guard were armed with this weapon, on the first formation of that corps in 1485. The A. being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated

the barrel; and the A. then obtained the name of the *haquebut*. Soldiers armed with these two kinds

Arquebusier.

of weapon were designated *arquibusers* and *haquebutters*—the former were common in the English army in the time of Richard III., the latter in that of Henry VIII.

ARRACA’CHA (*Arracacha esculenta*), a plant of the natural order *Umbelliferae*, a native of the elevated table-lands in the neighbourhood of Santa Fe de Bogota and Caraccas, and of regions of similar climate in other parts of tropical America. It is much cultivated in its native country for its roots, which are used as an esculent. The root divides into a number of parts, which resemble cows’ horns or large carrots. When boiled, they are firm and tender, with a flavour not so strong as that of a parsnip. The plant is very like hemlock, and has a similar heavy smell. Humboldt, indeed, referred it to the genus *Conium* (Hemlock), but it has since been made the type of a new genus. The flowers are in compound umbels, and are of a dull purple colour.

Arracach.

The A. was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the Horticultural Society, and its cultivation perseveringly attempted; but it has been found unsuitable to the climate of Britain and of other parts of Europe, where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavourable to it. The climate of the south of Ireland resembles that of its native regions more than any other in the British Islands. It seems to require a very regular temperature and constant moisture. There are probably some parts of the British colonies in which the A. would be found a very valuable plant. In deep loose soils, it yields a great produce. It is generally propagated, like skirret, by offshoots from the crown of the root. By rasping the root and washing, a starch, similar to arrow-root, is obtained.—There is another species of the same genus, *A. moschata*, a native of the same regions, the root of which is uneatable.

ARRA’CK, RACK, or RAKI, is an alcoholic liquor or spirit, largely prepared, and extensively

partaken of, in India and other parts of the East, including the Indian Archipelago, the Moluccas, and the Philippines; in Africa; in Chili, South America, and in the islands of the Pacific Ocean. The term A. is often used in eastern countries to designate any ardent spirit, but there are two principal varieties—viz., that prepared from palm-trees, and that procured from rice, which is also named *rice-spirit*. Many species of palm-trees yield the juice which constitutes the raw material for the manufacture of A. This sap or juice may be drawn from the tree by making an incision near the top, when the sweet sap exudes, and is collected; or by taking the partially developed spathe of the palm-tree (the part from which the flower and fruit are produced), tying it tightly near its attachment to the tree, and then cutting off the end of the spathe, and collecting the sweet juice which flows away from the wound. In either case, a milky-looking substance is obtained, which tastes, when fresh drawn, like the milk of the cocoa-nut; but which, when allowed to stand for a short time, passes into a state of fermentation; the liquid becomes alcoholic and acid, and in a few days an intoxicating liquor is left in the fermenting vessel, called *palm wine* or *toddy*, which on distillation yields A. The amount of milky sap and A. thus yielded by a single palm-tree ranges from 2 or 3 pints to 100 pints in the 24 hours. A. is likewise prepared from rice, which is first treated with water, allowed to germinate or sprout to a slight extent, then heated and dried, and lastly placed in vessels with water, where it ferments as in ordinary beer-brewing (q. v.). Though A. is little known in Britain, it is so extensively employed in other countries, that it appears probable that it is partaken of by more human beings than those who taste the produce of the vine (wine and brandy), or the barley (beer and whisky). In the desert Sahara of Africa, the soil is enlivened here and there by fertile oases, where clusters of date palm-trees stud the earth; and these not only supply food to the inhabitants, but in the flowering season the A. also, which is greedily partaken of by the Arab Mohammedans, and is to be found in every domicile. On the west coast of Africa, the oil-palm is likewise resorted to for its juice to make A.; whilst in India, the date and fan palms are principally placed under contribution. In the islands of the Pacific Ocean, the cocoa-nut palm is resorted to; and in Java, very large quantities of ardent spirit, or A., are prepared from rice. In Ceylon and Siam, the A. is manufactured from the cocoa-nut palm and from rice. The Chinese, who prepare and partake of A. in considerable quantity, get the credit of manufacturing the best kind of distilled A., known as the A. of Batavia. The latter owes its excellence to the manner in which the somewhat disagreeable flavour characteristic of ordinary A. is a little more than neutralised by the addition of cinnamon and anise-seed, and subsequently by very careful distillation. The inhabitants of Madagascar attempt to overcome the unwelcome flavour by the addition of the leaves of a species of trefoil; and the Asiatics generally add the bark of a kind of thorny acacia, called *Pattay*. Whilst the greater quantity of A. is consumed where it is manufactured, a smaller amount is exported. Ceylon despatches from its shores 700,000 gallons every year, of which England receives about 30,000 gallons. In Britain, A. is seldom used by itself, but is occasionally employed to impart an agreeable flavour to *punch*. An imitation A. is prepared by dissolving benzoic acid in rum, in the proportion of 20 grains of the former to 2 pounds of the latter.

A'RRAGONITE, a mineral essentially consisting of carbonate of lime, and so agreeing in chemical composition with calcareous spar (q.v.), but differing

from it in the form of its crystals, of which the primary form is a rhombic prism with angles of $116^{\circ} 16'$ and $63^{\circ} 44'$, the secondary forms being generally prismatic and pyramidal. The effects of heat on them shews another difference, A. being reduced to powder by a heat in which calcareous spar remains unchanged. Such differences between minerals of the same chemical composition appeared very improbable, and when Stromeyer, in 1813, detected the presence of a little carbonate of strontia in A., they were immediately ascribed to this as their cause; but it has since been shewn not only that the quantity of strontia is very small, variable, and therefore to be regarded as accidental, but also that the differences between the two minerals may be accounted for by difference of temperature when crystallisation was taking place. A. appears to be the product of a crystallisation taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighbourhood of hot springs, as at Carlsbad. It is frequently found in trap-rocks, as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs stalactitic. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystals (*maeles*) are very common. *Satin Spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i. e., flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

A'RRAH, a town in the district of Shahabad and the presidency of Bengal, in lat. $25^{\circ} 31' N.$, and long. $84^{\circ} 43' E.$ It is situated in a fertile country, and contains 2775 houses, with a population of at least 15,000. It is on the route between Dinapore and Ghazepore, 25 miles W. of the former, and 75 E. of the latter. During the mutiny of 1857, A. became in variety and intensity of interest second only to Cawnpore, Delhi, and Lucknow, connected as it was with a heroic defence, a heavy disaster, and a brilliant victory. The defence was that of an isolated house, for eight days, against 3000 sepoys with 2 field-pieces, the garrison consisting of less than 20 whites, all civilians, and 50 Sikhs, whose fidelity perhaps was doubtful till proved by trial. The disaster was the nocturnal surprise in the jungle of a detachment almost entirely European, sent to the relief of the beleaguered dwelling—the loss having been 290 out of 415. The victory was won by a force of 172 men, 12 of them mounted volunteers and 3 guns, over a host numbering nearly 20 to 1. In fact, A. happily, with the exception of the cold-blooded massacre of women and children, presented, in miniature, nearly all of the phases of the most formidable and eventful insurrection on record. For a detailed account of these events, see *Chambers's History of the Indian Revolt*.

ARRAIGNMENT, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. And having the presumption of innocence in his favour, it is the law, and so laid down in the most ancient books, that, though charged upon an indictment, of the highest nature, he is entitled to stand at the bar in the form and in the garb of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner is called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at

the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of *Not guilty*. Formerly, one of the incidents of the A. was the prisoner *standing mute*, as it was called—that is, refraining from, or refusing, a direct answer to the indictment; in which case the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God, and to deal with him accordingly. But by the 7 and 8 Geo. IV. c. 28, s. 2, it is enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officer to enter a plea of 'Not guilty,' on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. Where there is reason to doubt, however, that the prisoner standing mute is sane or not, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of 'Not guilty' is entered, and the trial goes on; but if the negative, the insane person will be ordered by the court to be kept in strict custody during her Majesty's pleasure, according to the 39 and 40 Geo. III. c. 94, s. 2.

By 19 and 20 Vict. c. 16, facilities are provided for the trials of prisoners in the Central Criminal Court, although the offence may have been committed out of the jurisdiction of that tribunal, and it directs the A. to take place in the ordinary form.

In the Scotch criminal law, the expression *Calling the Diet* corresponds to A. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, which he does as in England, by a plea of 'Guilty' or of 'Not guilty,' in the event of which latter, the trial proceeds—the prisoner, either by himself or his counsel, having always the last word before the court and before the jury. In this respect, it is otherwise in England.

According to Sir Matthew Hale, the term A. is derived from *arraisoner*, *ad rationem ponere*, to call to account or answer, which in ancient French law would be, *ad-resoner*, or, abbreviated *a-resner*. See TRIAL, INDICTMENT, INFORMATION, PROSECUTION, PLEA, VERDICT, NOT PROVEN.

ARRAN, an island in the mouth of the Firth of Clyde, Scotland, about 5 miles south-west of Bute, 13 west of Ayrshire, and 4 east of Cantire, from which it is separated by Kilbrennan Sound. It is of an oval form, about 20 miles long and 12 broad; area, 165 square miles, about 15,000 acres or a seventh part being cultivated. Pop. 6000. The general aspect of A. is mountainous and heathy, and in the north, the jagged peaks are singularly grand. Around the coast is a low belt of ground, with lofty cliffs on the south and south-west shore, from which the country rises abruptly. The highest point is Goatfell (an English corruption for Goath-Bhein, 'Wind Mountain'), an obtuse pyramid, 2865 feet high, and a prominent feature in the island. From its sides slope the romantic glens of Rosa and Sannox, and at its base to the south-east opens Brodick Bay, at the head of which lay, until lately, Brodick village. The houses which composed it have now been removed, and a new village has sprung up on the opposite side of the bay, called Invercloy, where there is a spacious hotel. To the south of this, round a bluff headland, is Lamlash Bay, the chief harbour of A., and the best on the Firth of Clyde,

sheltered by Holy Island, once the seat of a monastery. A picturesque mass of columnar basalt, 900 or 1000 feet high, succeeds. Further south lies Whiting Bay, near which are two cascades 100 and 50 feet high respectively. At the south-east point of A. is Kildoon Castle, opposite which is the small isle of Pladda, crowned by a light-house. Large caverns occur in the cliffs of the south and south-west coasts. In one of these, the 'King's Cave,' in the basaltic promontory of Drumuodune, Robert the Bruce hid himself for some time. Shiskan Vela, opening into Drumuodune Bay, is the most fertile part of A. Loch Ranza, a bay in the north end of A., runs a mile inland, and is a herring-fishing rendezvous. There is daily communication with A. by means of steam-boats from the Clyde, the ports touched at being Brodick and Lamlash.

The geology of A. is almost unique, and displays a greater succession of strata than any other part of the British Isles of equal extent. The south-east half of A. consists of Devonian sandstone, extending from the east coast 4 or 5 miles inland, and running south-west from Brodick beyond the centre of the island; and of trap rocks and carboniferous strata, which occupy the middle and western portions. The north-west half consists of a central granite nucleus, including Goatfell, bordered on the west by a tract of mica-slate, and on the north, east, and south by lower Silurian rocks, which, again, have a run of Devonian sandstone on the east and south. Lias and oolite lie on the mica-slate. There are only rivulets in A., and one of them tumbles over a precipice 300 feet high. Some level parts in the south half of A. are fertile. The chief crops are oats and potatoes. Cattle, sheep, fish, and oats are exported. The greater part of A. belongs to the Duke of Hamilton, whose seat is Brodick Castle. A. forms part of the county of Bute, and contains two parishes. Many antiquities occur, such as cairns, unhewn obelisks, monumental stones, and Druidical circles. Several stone coffins were found in a cairn 200 feet in circumference. Loch Ranza Castle, now in ruins, was formerly a residence of the Scottish kings.

ARRAN, SOUTH ISLES OF. These are three small islands lying north-west and south-east across the entrance to Galway Bay, about 4 miles off the west coast of Ireland, and 27 west of Galway city. They form the barony of A., and give the title of Earl to the Gore family. Total area, 11,287 acres. The principal or west island, Inishmore, is 7 miles long and 2 broad; Inishmain, or 'Middle Isle,' comes next; and then Inishere to the south-east. Population 3300, of which number 2300 inhabited Inishmore. The islands consist of the carboniferous limestone of the bed of Galway Bay. From this bay they gradually rise to the height of 100 to 200 feet on the west side, ending in cliffs facing the Atlantic. Most of the land is cultivated, but in a very primitive way. The chief crops are rye, oats, and potatoes. Most of the inhabitants engage in fishing; and the *corrach* or wicker-work skiff is still to be seen here. Like other isles on the west coast of Ireland, they are subject to famines from parching rainless west winds in August, destroying the potato-crop. Anciently, these islands formed an important ecclesiastical seat, containing at one time 20 churches and monasteries. Inishmore was the centre of these, still known as Aran-na-naomh, or 'Arran of the Saints.' Many pilgrims still visit the old shrines and relics scattered through the islands. St. Kenanach Church, built in the 7th c., still exists, all but its stone roof, as well as the stone oratories and little bee-hive stone huts of the monks of the 6th and 7th centuries. The military antiquities are not less remarkable, consisting of nine circular cyclopean fortresses of unhewn

uncemented stones (portions of the walls still being 20 feet high), supposed to have been built in the 1st c. by the Fir-Bolg or Belgæ. The largest of these, Dun-Aengus, on a cliff in Inishmore, 220 feet high, is one of the most magnificent barbaric monuments in Europe.

ARRANGING, a term in Music which means the adapting of a piece of music so as to be performed on an instrument or instruments different from those for which it was originally composed, as when orchestral or vocal compositions are set for the pianoforte, or the reverse. An arrangement is often a mere lifeless transposition of the original, the only guiding principle being the mechanical possibility of performance. Of this kind are most of the pianoforte arrangements of the orchestral works of Mozart, Beethoven, &c.—partly from the arranger working merely for hire, and partly from a mistaken reverence for, and fear of altering, the original. It is different when an arranger, who thoroughly comprehends the spirit of the original, takes advantage of the peculiar means of expression afforded by the new form of presentation, to reproduce as much as possible the original effects. In this last respect, the arrangements of Franz Liszt have excelled all others, although in some cases he may have overstepped the boundary of propriety. See **POT-POURRI** and **FANTASIA**.

ARRAS (the ancient *Nemetacum*), a fortified town and capital of the department of Pas-de-Calais, as it was formerly of the province of Artois, in France. It is situated on the banks of the Scarpe, partly on an eminence, and partly on a plain, and consists of four divisions—the city, upper town, lower town, and citadel. It is a principal station on the French Northern Railway, distant from Paris by this route 134 miles, and from Brussels, 97. The pop. (1856), 21,984. The houses are of hewn stone, and in the lower town they are handsomely built and uniform; the streets straight and wide, set off with several fine squares, and many beautiful public buildings. Among the principal edifices are the Cathedral of Notre Dame, the residence of the prefect, the town-hall, the theatre, and the public library.

A. ranks as a fortified town of the third class, its fortifications being the first that were constructed by the celebrated Vauban, according to his own system. It has been the seat of a bishop since 390 A. D., and two ecclesiastical councils have been held here—one in 1025, the other in 1490.

The corn-market of A. is the most important in the north of France. Its principal manufactures are iron-ware, woollen and cotton goods, hosiery, lace, pottery, and leather. Its trade, which is considerable, is in corn and flour, oil, wine and brandy, with the industrial products of the city.

It appears from the writings of Jerome that A. was remarkable for its woollen manufactures in his time; and afterwards, during the middle ages, it was famed for its tapestry; indeed, the name of the town was transferred to this article of manufacture, and *arras* was the name given in England to the richly figured hangings that adorned the halls of the kings and the barons.

In 1482, A. with Artois was ceded by the states of the Netherlands to Louis XI. of France; but the inhabitants having revolted, the king laid siege to the town, stormed it, and slew or expelled the people, whom he replaced by others brought from all parts of his dominions, ordering the city to be thenceforward called *Franchise*, to obliterate the very name of A. Soon afterwards (1493) it was ceded to Maximilian of Austria, and was possessed by the Spanish branch of the House of Hapsburg till 1640,

when Louis XIII. of France took it after a long siege. By the treaty of the Pyrenees, it was finally ceded to France. A. suffered much in the time of the first French revolution, especially in the year 1793. Robespierre, the Terrorist, was a native of the town.

ARRA'YER, a title given to certain military officers in England in the early part of the 15th c. There were two of them in each county, sometimes called Commissaries of Musters. Their duties were set forth in an ordinance of Henry V., from the terms of which it appears that the arrayers were army inspectors, or, rather, militia inspectors, and in some sense precursors to the modern lords-lieutenant of counties.

ARREST is a legal term used both in criminal and civil process. Criminal A. has already been sufficiently considered under the word **APPREHEND** (q. v.); and in civil procedure it may be simply defined to be the execution of a judicial or prerogative order, by which the liberty of the person may be restrained, and obedience to the law compelled. In the practice of the Court of Chancery, a defendant may be arrested for his contempt in not putting in his answer to a bill filed against him; and suitors generally who disregard the rules of that tribunal are liable to feel its power in this respect. But in its ordinary legal acceptance, A. is used to signify the enforcement of the judgment or order of a court of law, in order to satisfy justice. In the execution of such judgment, the party against whom it has been given may be arrested by means of a writ of *capias ad satisfaciendum*, as it is called, the purpose of which is to imprison the body of the debtor till he pays the debt or damages and costs. It is directed to the sheriff, commanding him to take the body of the debtor, and have him at Westminster immediately after execution thereof, to make the plaintiff satisfaction for his demand. This writ might, until lately, issue for a judgment debt of any amount; but by the 7 and 8 Vict. c. 96, s. 57, it is provided that it shall not issue in the case of a debt not exceeding £20, exclusive of costs; subject, however, to this proviso, that where such debt should appear to the judge trying the cause (being a judge of the superior courts, or a barrister or attorney) to have been incurred under false pretences, or with a fraudulent intent, or without a reasonable assurance of being able to pay or discharge the same, it shall be lawful for such judge to order the defendant to be taken and detained in execution upon such judgment, as if the act had not passed. And it has been since provided by 8 and 9 Vict. c. 127, and 10 and 11 Vict. c. 102, s. 2, that judgment debtors to the extent above mentioned may be summoned before the Insolvent Court in London, or the county court for the district in the country (as the case may require), and thereupon be ordered to pay the debt by instalments or otherwise; and further, that in case of their non-compliance with such order, or of its appearing to the court that they have been guilty of fraud in contracting the debt, or of having contracted it without reasonable prospect of being able to pay the same, they may be committed to prison for forty days, and the imprisonment under such committal shall not operate in satisfaction or discharge of the debt.

A defendant may also be arrested under a writ of *capias ad respondendum*, which issues as follows—where a plaintiff swears by affidavit that he has a cause of action against a defendant to the amount of £20 or upwards, or has sustained damage to that amount, and that there is reason for believing that the defendant is about to quit the country, an order is made by a judge—and such order may be made at any time between the commencement of the action

and final judgment—when the writ in question issues, directing the sheriff to arrest the defendant, who remains in custody until he has given satisfaction in respect of the plaintiff's demand. The practice with reference to this writ is regulated by the 1 and 2 Vict. c. 110. Formerly, a defendant might be arrested on what is called *mesne process*, that is, process issuing at the commencement and during the progress of a suit; but by the act just referred to, such A. is abolished, excepting as above explained.

Under such and similar authority, A. may be made of the person. There are classes, however, who are exempted by privilege from A.—thus, ambassadors and other diplomatic representatives of foreign courts; all members of the peerage, Scotch and Irish as well as English; all members of parliament; all persons connected with a cause before a court of justice, and attending in the course of it, such as witnesses, attorneys, and barristers—although in regard to the latter (barristers), it may be more correctly stated that they are entitled to the privilege only when attending the *superior courts*; and Mr. Archibold, in his *Practice of the Common Law*, refers to a case where a barrister was discharged who was arrested on circuit. The Queen may also, by her writ of protection, privilege any person in her service from A. during a year and day, a prerogative, however, which is seldom, and, at the present day, scarcely ever exercised. In regard to parliamentary exemption from liability to civil process, however, the privilege does not preclude the process from issuing, it only protects the *person* of the member himself; for by 10 Geo. III. c. 50, it is enacted that any action or suit may at any time be brought against any member of either House, or against their servants, or any other person entitled to privilege of parliament; and that none such, nor any process or proceeding thereupon, shall at any time be impeached, stayed, or delayed, by pretence of any such privilege, except that the person of a member of the House of Commons shall not thereby be subjected to any arrest or imprisonment. It is likewise provided by the Bankrupt Consolidation Act, 1849 (12 and 13 Vict. c. 106), that if a trader, being a member of parliament, who was sued for a debt of such amount as shall be sufficient to support a petition in bankruptcy, shall not pay or otherwise satisfy the debt within one calendar month, he shall be deemed to have committed an act of bankruptcy, and may be dealt with as a bankrupt, though not to the extent of making him liable to A.

In the Scotch law, the word A. is not a technical term for process against the person. But see ARRESTMENT, and ARRESTMENT FOR FOUNDING JURISDICTION.

ARREST OF JUDGMENT, in the practice of the English common law courts, was an expedient after verdict on the part of an unsuccessful defendant, who endeavoured to get the judgment arrested or withheld, on the ground that there was some error which vitiated the proceedings; and if this objection succeeded, it was fatal, no amendment being allowed after trial. But as this rule was found to be productive of great inconvenience, expense, and often injustice, it has been considerably modified by the Common Law Procedure Act of 1852 (the 15 and 16 Vict. c. 76), under which, omitted facts or other matter may, by leave of the court, be suggested, by which the error may be corrected. See JUDGMENT.

ARRESTMENT, in the Scotch law, is the legal process or diligence, as it is called, by means of which a debtor, where the debt is of a personal nature, is prohibited from making payment or delivery to his creditor until another debt or claim

due to the person making use of the arrestment by such creditor is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the *arrestee*; C, the user of the arrestment, is called the *arrestor*; and B, the arrestor's debtor, is called the *common debtor*. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called an *action of forthcoming*, is necessary, decree in which operates as a complete transfer to the arrestor. This process may be sued out either by authority of the Court of Session or by that of an inferior judge. The procedure is now regulated by the 1 and 2 Vict. c. 114, ss. from 16 to 22 inclusive.

The corresponding English term is ATTACHMENT (q. v.).

ARRESTMENT FOR FOUNDING JURISDICTION. This is a form of proceeding in the practice of the Scotch law, and it is of an extremely important nature, for, by means of it, a foreigner, or one beyond the jurisdiction of the courts of Scotland, and who happens to have any property in that country, may be sued in the Scotch tribunals. It is a personal remedy, and the mode of procedure is thus: The summons (or declaration, as it would be called in England), which is executed by leaving a copy in the proper office in Edinburgh, contains in express terms a warrant to arrest *ad fundandam jurisdictionem*; and when served on the party having possession of the foreigner's property, such warrant has the effect of attaching it, so as to give the court jurisdiction over the foreigner himself. This manner of founding jurisdiction is said to have been borrowed by the Scotch from the lawyers of the Netherlands, and it can be traced back in the practice of the Scotch courts for upwards of a century. In a recent case, however, brought by appeal to the House of Lords from Scotland, an attempt was made to shew, that for this mode of A. there was no sufficient authority in the law of that country, and it was represented to the House as a barbarous contrivance of comparatively recent introduction. But their lordships had no hesitation in affirming the judgment of the Court of Session in favour of their jurisdiction so obtained. See JURISDICTION.

ARRESTMENT OF WAGES is supposed to exercise a baneful influence on some of the working-classes in Scotland, by putting them in the power of greedy and oppressive dealers, who, in the knowledge of the power they thus possess, are too ready to give credit to working-people, and thus encourage them in extravagance. It was the object of so much complaint in Glasgow, that a government inquiry was instituted into its operation in 1863. That inquiry developed a sad amount of extravagance and folly, but did not afford a hope that any mere alteration in the machinery of the law would remedy a deep-rooted social evil. Its most alarming features were found in the female manufacturing population, the younger of whom especially, led by avidity for fine clothes, were the victims of a powerful organisation of dealers, on what is called the club-ticket system, the peculiarity of which is, that the price of the article purchased is paid in instalments, according to the payment of wages. It was part of the system, whenever any defalcation occurred, to arrest the wages, and thus legal expenses were added to the cost of an article which, to keep up the expensive organisation of the system, would be originally sold at an excessive price.

ARRHENATHERUM, a genus of Grasses, allied to *Holcus* (see **SOFT-GRASS**) and *Avena* (see

Arrhenatherum :

a, panicle, reduced; b, root and lower part of culm, reduced; c, a single spikelet, natural size.

OAT), and distinguished by a lax panicle, two-flowered spikelets with two glumes, the lower floret having stamens only, and a long twisted awn above the base; the upper floret perfect, with a short straight bristle below the point.—The name A. is from the Greek *arrhen*, male, and *ather*, an awn. *A. avenaceum* (*Avena elatior* of Linnaeus, also known as *Holcus avenaceus*) is a common grass in Britain. It is sometimes called OAT-LIKE GRASS, from the resemblance to the coarser kinds of oats in the general appearance of the panicle. In France, it is very much cultivated for fodder, and is often called FRENCH RYE-GRASS. It has, however, no affinity to the true Rye-grass (*Lolium*). It is a tall perennial grass, 2–3 feet high, becomes luxuriant early in the season, and continues long productive. It is, however, a rather coarse grass, and has a somewhat bitter saline taste; it is not so acceptable to cattle as many other grasses, and is therefore generally regarded by

British agriculturists as unworthy of cultivation on the best soils; but it is found suitable for some comparatively arid situations, and to form a coarse herbage under trees in plantations.—A variety or distinct species, differing from it in having a knotted or bulbous base to the stem, instead of a simple fibrous root, is called by some botanists *A. bulbosum*. It is also common in Britain, but is a very inferior grass, and owing to the character of its roots, difficult of extirpation from lands in which it appears as a weed.

ARRIANUS, FLAVIUS, a native of Nicomedia, in Bithynia, born about 100 A.D. He became a disciple of Epictetus, the stoic philosopher, and, under his instructions, a warm advocate of that system. On bringing before the public the earliest products of his pen, the learned men of Athens were highly pleased with them, and honoured him with the freedom of their city. A. had chosen Xenophon as his model of composition, and hence the Athenians called him the young Xenophon. In 124 A.D. he was introduced to the Emperor Hadrian in Greece, who conferred on him the freedom of the eternal city. He was appointed prefect of Cappadocia in the year 136. Under Antoninus Pius, the successor of Hadrian, he was promoted to the consulship. But

some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place. As the pupil and friend of Epictetus, he edited the Manual of Ethics (*Encheiridion*) left by his master, and wrote the *Lectures of Epictetus*, in eight books, of which only four have been preserved—to be had in Schweighäuser's *Philosophie Epicteteæ Monumenta*, vol. iii. (Paris, 1827). He wrote also *The Conversations of Epictetus*, a work which has been lost, except a few fragments. The most important work by A. is the *Anabasis of Alexander*, or *History of the Campaigns of Alexander the Great*, which has come down to us entire, all but a gap in the 12th chapter of the 7th book. This book is our chief authority on the subject of which it treats, and is a work of great value. In close connection with it, A. wrote his *Indian History*, giving an account of the people of India. Other writings by A., his letter to Hadrian on *A Voyage round the Coasts of the Euxine Sea*, and another, *A Voyage round the Coasts of the Red Sea*, are valuable with regard to ancient geography. There is still another work by our author—a Treatise on the Chase (*Kynegeticos*)—in which, as well as in the *Anabasis*, he has imitated Xenophon.

A. was one of the best writers of his day. His works bear the marks of care, honesty, and correctness; and they were numerous, though several have not been handed down to our time. All that we are possessed of appear to have had translations into Latin. There is a good French translation of the *Anabasis* by Chaussard, with commentary, 3 vols. (1802), and also a good one of the *Lectures of Epictetus* by Thurot (1838). The best critical edition of A. is that by Müller (Paris, 1846).

ARROBA, a weight commonly used in Spain, Portugal, Brazil, and in the principal Spanish and Portuguese colonies. In the first of these countries, it is equivalent to the English quarter of a cwt., or 28 lbs.; it is nearly the same in Portugal, &c. In Spain, the A. is also a measure for wine, brandy, &c., and contains four of our quarts.

ARRONDISSEMENT (from the French *arrondir*, to make round), the subdivision of a French Department (q. v.)

ARROW. See BOW AND ARROW.

ARROWHEAD (*Sagittaria*), a genus of plants of the natural order *Alismacea*, distinguished by unisexual flowers, having three herbaceous sepals and three coloured petals, numerous stamens, and numerous carpels, which are compressed, one-seeded, and on a globose receptacle. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world.—The Common A. (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid bulbs), dried and powdered, have sometimes been used for food, but have an acrid unpleasant taste.—The CHINESE A. (*S. Sinensis*) is a native of China, and has long been cultivated in that country and Japan for its eatable corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves, and a branched polygonal scape (leafless stem). It is grown in ditches and ponds. It is one of the plants sometimes cultivated in tanks in the hot-houses of Britain.

ARROW-HEADED CHARACTERS, See CUNEIFORM INSCRIPTIONS.

ARROW-HEADS. See FLINT ARROW-HEADS.

ARROW-ROOT is a variety of starch extracted from the roots of certain plants growing in tropical

countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for children and invalids. It is obtained from the tuberous roots—or more correctly, the root-stocks (*rhizomes*)—of different species of the genus, *Maranta*, belonging to the natural order *Marantaceæ*, and characterised by solitary ovules, a fleshy style curved downwards, branching stems, and white flowers. The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India Islands, and growing about two feet high, with ovato-lanceolate somewhat hairy leaves, clusters of small flowers on 2-flowered stalks, and globular fruit about the size of currants. The roots (or rhizomes) contain a large proportion of farina. They are often more than a foot long, of the thickness of a finger, jointed, and almost white, covered with pretty large paper-like scales. They sometimes curve so that the points rise out of the earth, and form new plants. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. Mills for this purpose have been introduced; but in Jamaica the roots are usually reduced by beating in deep wooden mortars; in Bermuda, by means of a wheel-rasp. The pulp is then mixed with much water, cleared of fibres, by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch

because substitutes for the genuine *A.* more frequently receive that name. The *Maranta arundinacea* is now, however, cultivated to some extent both in the East Indies and in Africa. *M. Indica*, which was supposed to be distinct from *M. arundinacea*, is now regarded as a mere variety of it, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica. *A.* is obtained also from *M. Alloufia* and *M. nobilis* in the West Indies, and from *M. ramosissima* in the East.

The amount of fecula or starch present in the roots of the *Maranta* varies according to age, and runs from 8 per cent., in those of the young plant, to 26 per cent. when full grown. The latter stage is reached when the plant is 10 to 12 months old; and the roots then present the following composition in 100 parts:

Starch, fecula, or arrow-root, ...	26
Woody fibre, ...	6
Albumen, ...	1½
Gummy extract, volatile oil, and salts, ...	1
Water, ...	65½

A. is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white, powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snow-ball. Through the microscope, the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry farina is quite inodorous, but when dissolved in boiling water, it has a slight peculiar smell, and swells up into a very perfect jelly. Potatoc-starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. *A.* is also sometimes adulterated with rice-starch and with the common starch of wheat-flower.

Not less than 400,000 lbs. of *A.* are annually imported into the British isles. As an article of diet, it is often prepared for invalids and children by merely dissolving it in boiling-water and flavouring with sugar, lemon-juice, wine, &c. It is also often prepared with milk, made into puddings, &c. When most simply prepared, it forms a light meal, which, however, is not very nutritious. See NUTRITION.

A farina somewhat similar to *A.*, and partly known by the distinct name of *Tous-les-mois*, is obtained from some species of the allied genus *Canna* (q. v.). But East Indian *A.* is in part obtained from the tubers of *Curcuma angustifolia*. Other species of *Curcuma* (see TURMERIC), as *C. Zerumbet*, *C. leucorhiza*, and *C. rubescens*, also yield a similar farina; the same tubers which, when young, yield a beautiful and pure starch, yielding turmeric when old. In Travancore, this starch is a principal part of the food of the inhabitants. The young tubers of the Galangal (q. v.), (*Alpinia Galanga*), another plant of the same natural order (*Scitamineæ*), are another source of this farina.—A farina somewhat resembling *A.*, and often sold under that name, is obtained from different species of the natural order *Cycadaceæ*, as from the dwarf fleshy trunks of *Zamia tenius*, *Z. furfuracea*, and *Z. pumila* in the West Indies, and from the large seeds of *Dion edule* in the lowlands of Mexico.—The starch of the Cassava, Manihot or Manioc (see MANIOC), is sometimes imported into Europe under the name of Brazilian *A.* Potatoc-starch, carefully prepared, is sometimes sold as English *A.*; and the farina obtained from the roots of the *Arum maculatum*

Arrow-root (*M. arundinacea*).

a, tubers; *b*, leaf and flowers; *c*, stamen and style.

quickly settling down as an insoluble powder. Successive washings are employed for further purification. The *A.* is finally dried in the sun or in drying-houses, great care being taken, by means of gauze, to exclude dust and insects. The careful peeling of the roots is of great importance, as the skin contains a resinous matter, which imparts a disagreeable flavour to *A.* with which it is allowed to mix. Great care is taken to preserve the *A.* from impurities; and the knives used in peeling the roots and the shovels used in lifting the *A.*, are made of German silver. The West Indian *A.*, most esteemed in the market, is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian *A.* is not in general so highly valued, perhaps

(see ARUM), as Portland A. Otaheite A. is the starch of *Tacca* (q. v.) *pinnatifida*.—All these, as well as Oswego and Chicago corn-flour—the starch of maize or Indian corn—are so nearly allied to true A. as not to be certainly distinguishable by chemical tests; but the forms of the granules differ, so that they can be distinguished by the microscope.

The name A. is commonly said to have had its origin from the use of the fresh roots by the South American Indians as an application to wounds to counteract the effects of poisoned arrows; and the expressed juice has been recently recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles. But it is not improbable that the name is really another form of *Ara*, the Indian name.

ARROYO MOLINOS, a village in Estremadura, Spain, noted as the scene of General Girard's complete discomfiture by Lord Hill on the 28th October 1811. General Girard had been sent out by Soult on a plundering foray with 5000 men, when he was surprised early in the morning by Lord Hill, who had slept a league off at Alcuéscar; the natives of which had the good sense not to betray the presence of their deliverers. With a couple of regiments, the 71st and 92d, the English general dashed through the rain upon the enemy, who fled in all directions, leaving behind everything, arms, packs, &c. 1300 prisoners were taken; the whole artillery, colours, baggage, &c. French historians (Thiers, &c.), however, maintain that the battle was 'undecided,' and that their countrymen only retreated in good order, under the pressure of much larger forces.

ARRU' ISLANDS, a group lying about 80 miles to the south of the west part of New Guinea, extending in S. lat. from 5° 20' to 6° 55', and in E. long. from 134° 10' to 134° 45'. The largest of the cluster is 70 miles long and 20 broad. The inhabitants, many of them said to be Christians, are a mixed race of Malays and Melanesians or oriental negroes. British goods, to the annual value of £30,000, are imported into Dobbo, a mart on the island of Warud, mostly by Dutch and Chinese merchants—the returns being chiefly pearls, mother-of-pearl, and trepang, which abound on a coral-reef to the east. In position and formation, these islands appear to be rather Australian than East Indian.

ARSACES, a name common to several Parthian and Armenian kings. The accounts concerning them which have been transmitted to us by the ancient historians are exceedingly vague, confused, and contradictory; and modern criticism has found itself unable to reconcile or simplify the conflicting statements. The two most important members of the dynasty of the Seythian Arsacidæ were A. I. and A. VI.

ARSACES I., the founder of the Parthian monarchy, flourished in the 3d c. B.C., under the reign of Antiochus-Theos. An atrocious insult offered to his brother Tiridates by Pherecles or Agathocles, Macedonian satrap of the country, is said to have fired his spirit, and driven him to rebel. The Macedonians were expelled, 256 B.C. Antiochus, embroiled in a war with Egypt, could not immediately find time to attempt the recovery of this portion of his dominions. Seleucus, the son of Antiochus, made two unsuccessful expeditions against the insurgent chief, in the last of which he was taken prisoner. A. I. now acquired regal power, built a city called Dara, on the mountain Zapaortenon, developed the internal resources of his new kingdom, and endeavoured to organise it; and, after the conquest of several countries, died at a great age. Such, at least, is the account given by Posidonius, &c.; but Arrian states that A. died after a reign of

two years, and that his brother Tiridates succeeded him, under the name of A. II., and ruled for thirty-seven years, whence we may conclude that many of the acts attributed to the founder of the Parthian kingdom were the work of his successor.

ARSACES VI., or MITHRIDATES I., flourished about the middle of the 2d c. B.C. He enlarged the territories of the Parthians by the conquest of Bactria; and is even supposed to have penetrated into India, and subdued the nations between the Hydaspes and Indus. In the year 138 B.C., he defeated and took prisoner Demetrius Nicator, king of Syria, whom, however, he treated generously, bestowing on him his daughter in marriage. He was a just and merciful prince, and an enemy to luxury.

A'RSENAL is the name given to a great military or naval repository, where the munitions of war are to some extent manufactured, but more particularly stored until required for use. Every royal dock-yard, every magazine, every armoury, is to some extent an A.; and therefore the meaning of the word is not quite definite. In France, the chief arsenals are at Cherbourg, Brest, and Toulon. In England, although Deptford is a considerable storehouse for naval clothing and provisions, and Weedon and the Tower great repositories for military stores, the only establishment vast enough to deserve the name of A. is at Woolwich. This is truly a remarkable and important place. In the spring of 1859, when war was raging in Italy between the French and Sardinians on one side, and the Austrians on the other, and when an uneasy feeling pervaded our own country, there were for a short time more than 10,000 men employed in Woolwich A. There were at that time nearly 12,000 pieces of iron ordnance in store, of which 7000 were of modern make and of heavy calibre. This store was supplementary to that which is always kept at the dockyards of Woolwich, Chatham, Sheerness, Portsmouth, Plymouth, and Pembroke. There were resources at the A. for bringing forward, fitting, and issuing these reserve guns at the rate of 200 per week, or double this number on an emergency; and many hundreds were within a brief period shipped thence, to strengthen our forts in the Mediterranean, in the colonies, and around the coasts. All the shot and shell used down to the period of the Crimean war, were ordered of private makers; but the charge was so enormous during the early months of that war, that the government resolved to try the manufacture at Woolwich; this was done, with a very manifest saving of expense. It has been calculated that the A., when at full work, could produce large shot and shell with six times the rapidity with which those missiles were used by the British outside Sebastopol during the eleven months' siege. These observations no not apply to rifles or muskets; none of these weapons are made at Woolwich. There have been times, however, during the year 1859, when nearly a *hundred million* rifle-bullets were in store at the A. The Armstrong guns (described under that heading) were made during the year 1861, and subsequently at the A., 9, 12, and 18 pounders, in sufficient number to supply all our field-artillery batteries: siege-guns and ships' guns, of this construction, are left for future consideration. It is calculated that there are 15,000 great guns on board the ships of the Queen's navy, besides a number varying from 15,000 to 20,000 at Woolwich and in the dockyards.

A'RSENIC is the name applied in popular language to a well-known poisonous substance, Arsenious Acid (q. v.), but, strictly speaking, the

term is restricted to a metallic body which in part enters into the composition of the poison. The metal A. is rarely found free in nature, but in a state of combination it occurs largely (see ARSENICAL MINERALS). The metal is generally prepared from arsenious acid (AsO_3) by mixing it with its own weight of charcoal, placing the mixture in a well-covered crucible, and subjecting the whole to heat, when the metal set free by the charcoal rises, and condenses in the upper part or cover of the crucible. Metallic A. is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system, it is there faintly

Native Arsenic.

acted upon by the juices, and in part dissolved, at the same time, exhibiting poisonous properties. When heated in the open air, it burns with a peculiar bluish flame, and emits a characteristic alliaceous odour. The only use to which the metal A. is applied in the arts is in the manufacture of leaden shot of the various sizes, when its presence in small quantity in the lead renders the latter much more brittle than it ordinarily is. Of all the compounds of A. the most important is the one already alluded to—namely, Arsenious Acid, which is an oxide of A. With sulphur, A. forms two important compounds: *Realgar* (AsS_2), a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *White Indian Fire*; and *Orpiment* (AsS_3) or *King's Yellow*, a cheap pigment of a yellow colour. With hydrogen, A. forms arseniuretted hydrogen (AsH_3), a very poisonous gas, and one which has been fatal to several chemists.

ARSENICAL MINERALS occur chiefly in primitive rocks, and frequently associated with other metalliferous minerals.—*Native Arsenic*, although nowhere very abundant, is not unfrequently found in mines in Europe, Asia, and America, generally along with sulphur and metallic sulphurets. In Britain, it occurs at Tyndrum in Perthshire. It has usually a fine granular character. It is very seldom, if ever, quite pure, usually containing a little antimony and iron, and not unfrequently a very little silver or gold.—A very similar, and still rarer mineral, found in similar situations, is known as *Arsenic-antimony*, and consists of about two parts of metallic arsenic, and one of metallic antimony.—*Arsenic-silver*, or *Arsenical Silver*, is another very rare mineral, consisting chiefly of arsenic and iron, but containing also about 13 per cent. of silver and a little antimony.—*Arsenic-glance*, found at Marienberg in Saxony, and containing about 3 per cent. of bismuth, has the remarkable property of taking fire at the

flame of a candle.—*Arsenious Acid* occurs native in a few localities in Germany and France, and as a mineral species, has received the name of *Arsenite*, which perhaps too closely resembles the chemical designation of its salts.—*Arsenic Acid*, another compound of arsenic and oxygen (AsO_5), containing more oxygen than arsenious acid, although it does not itself occur native, is not unfrequent in the form of compounds with copper and lead (*Arsenates* of copper and lead), which enter into the composition of a number of minerals, none of them so abundant as to be of any importance.—Among A. M. are also to be ranked the compounds of arsenic with sulphur, particularly *Orpiment* (q. v.), *Realgar* (q. v.), and *Dimorphine*, a rarer mineral than the other two, and therefore less important.—But the most important of all A. M., because of their use as ores of arsenic, for the preparation of white arsenic, or arsenious acid, are those in which arsenic is combined with nickel and cobalt. One of these is *Arsenical Pyrites*, or *Leucopyrite*, found in various mines of the continent of Europe, and containing arsenic, iron, sulphur, nickel, and cobalt, in somewhat various proportions—the arsenic, however, always the principal constituent. It generally occurs massive.—*Mispickel*, which frequently occurs in rhombic crystals, but often also massive, differs from it in containing a considerable quantity of silver, so that it is used both as an ore of arsenic and of silver. It is found in many of the tin-mines of Cornwall, and is pretty frequent in different parts of the world.—*Nickeline* consists of nickel and arsenic, and is used as an ore of nickel, and also for the preparation of white arsenic.—*Cobaltine* and *Smalline*—the former consisting of cobalt, sulphur, and arsenic; the latter, of cobalt and arsenic—are used for the preparation of blue colours for porcelain and stoneware. Both are found in Cornwall; they occur also in some of the mines of the continent of Europe, and in other parts of the world.—The presence of arsenic in a mineral may commonly be detected by the alliaceous odour which it emits before the blow-pipe.

ARSENIOUS ACID is the arsenical compound most familiarly known. It is obtained principally during the roasting of the arsenical nickel ores in Germany in furnaces communicating with flues. When the arsenic of the ore burns, it passes into the condition of A. A. (AsO_3), and rising as vapour into the somewhat cool flue, is there deposited as a grayish powder, known by the name of *Smelting-house Smoke*, *Flowers of Arsenic*, *Poison-flour*, or *Rough A. A.* In this condition, the A. A. is contaminated with some impurities, from which it may be separated by introducing the gray powder into an egg-shaped vessel, and applying heat at the lower end, when the A. A. rises in vapour, and condenses in the cool end as a transparent glassy or vitreous substance. Ordinary A. A. of the shops (which is what is popularly known as *arsenic*) is a white crystalline powder, which feels decidedly gritty, like fine sand, when placed between the teeth, and has no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in water to the extent of 1 part of A. A. in about 100 parts of cold water, and 1 part of A. A. in about 10 parts of boiling water. As ordinarily sold in quantities under 10 lbs. in weight, the A. A. is required by law to be coloured with $\frac{1}{32}$ of its weight of indigo, or $\frac{1}{16}$ of its weight of soot; the object of the admixture being to render any liquid to which the A. A. might be added, with a murderous intent, of a black or bluish-black hue, and thus indicate the presence of something unusual. In packages of 10 lbs. and upwards, A. A. is allowed to be sold in the pure white crystalline form without

coloration. When placed in a spoon, or other vessel, and heated, the A. A. volatilises, and condenses in crystals on any cool vessel held above. By this means, it can be distinguished from ordinary flour, which, when heated, would char, and leave a coal behind; and from chalk, stucco, baking-soda, tooth-powder, and other white substances, which, when heated, remain in the vessel as a non-volatile white residue. Again, when A. A. is placed on a red-hot cinder, and the escaping vapours cautiously brought under the nostrils, the strong alliaceous odour characteristic of arsenic is given off. The mode in which A. A. comports itself, when thrown upon water, is likewise peculiar. Instead of at once descending through the water like sand, the A. A., notwithstanding its great density (sp. gr. 3.70), partially floats on the surface, as wheat-flour does; and that portion which sinks into the water, rolls itself into little round pellets, which are wetted only on the outside, and contain much dry A. A. within. The solution of A. A. in water is recognised by three tests:

1. Hydrosulphuric acid and hydrochloric acid produce a *yellow precipitate* of sulphuret of arsenic (As_2S_3), soluble in ammonia.

2. Ammonio-sulphate of copper, an *apple-green precipitate* of arsenite of copper ($2\text{CuO}, \text{AsO}_3$).

3. Ammonio-nitrate of silver, a *yellow precipitate* of arsenite of silver ($2\text{AgO}, \text{AsO}_3$).

In many cases, A. A. is used as a means of destroying animal life, but, happily, the process for the detection of the poison is organic mixtures and in the animal tissues are so unerring and trustworthy, that it is hardly within the range of possibility that an animal can be destroyed by the administration of A. A. without very decided evidence of the existence of the poison being obtained on examination of the various parts of the animal structure; indeed, it may be safely said that there is no limit to the detection of the poison, as even after the animal structure has been so far decomposed that little remains, yet still the poison, from its indestructibility, survives, and will indicate itself clearly, on the application of the several tests.

For the isolation and recognition of A. A. in organic mixtures, such as the contents of a stomach, three processes may be followed. The method generally pursued, and that upon which the greatest dependence is placed, is called Reinsch's process, from the name of its discoverer. The manner of its application is to treat the organic mixture with water sufficient to render it thin, then add hydrochloric acid to the extent of one-eighth of the volume of the liquid; apply heat, and when the whole has been raised to near the boiling-point, introduce clean, newly burnished pieces of copper in the form of wire, gauze, or foil. If A. A. be present in the mixture, a steel grey coating of metallic arsenic will form on the surface of the copper. This apparent tarnishing of the copper may take place when no A. A. is in the mixture, and may be produced by salts of mercury, antimony, &c., as well as by sulphur compounds, and even occasionally by fatty matters. To distinguish between the coating formed by A. A. and that produced by other substances, the copper is taken out of the mixture, washed with water, to remove acid; immersed in ether, to dissolve off any adherent fatty matter; dried between folds of blotting-paper; introduced into the lower end of a dry glass test-tube, and there cautiously heated. The metallic arsenic (As) is driven off by the heat from the surface of the copper, rises in vapour into the upper portions of the test-tube; there meets the oxygen of the air, with which it combines, forming A. A. (AsO_3), and thereafter deposits itself on the inner surface of

the cool part of the tube in little glistening crystals. On allowing the tube to cool, adding water thereto, and applying heat, the water dissolves the crystals of A. A., yielding a solution, to separate portions of which the liquid tests mentioned above may be successfully applied. This process may likewise be employed in the detection of A. A. in animal tissue, as in the liver, spleen, kidneys, &c., by first dividing the animal matter into small pieces, and thereafter treating with water, hydrochloric acid, and copper. The precautions which require to be exercised in trying this process are, that the hydrochloric acid and copper are themselves free from A. A. Hydrochloric acid has long been known to be liable to contain at times a very sensible proportion of the poison, and it is therefore necessary, before using the acid in any experiment, to make a preliminary trial with dilute hydrochloric acid, into which, when heated, a piece of copper is immersed; and if no tarnishing occurs after a quarter of an hour's trial, the acid may be declared free from contamination with arsenical compounds. The liability of copper to contain arsenic has only very recently (August 1859) assumed importance in connection with a trial for murder by slow poisoning with arsenic, which took place in Britain. In this case, a considerable amount of copper was dissolved during the testing, and supplied the poison in quantity enough to produce a faint coating on a piece of copper which was subsequently introduced into the liquid. The result was that A. A. was at first declared to be present in the material under examination; but further experiments demonstrated that the copper itself had afforded the arsenic. To free copper from any arsenic which it may contain originally, it is only necessary to heat the copper over a gas or spirit-lamp flame, when the arsenic volatilises, and leaves the copper uncontaminated therewith.

The other two processes for the detection of A. A. in organic mixtures are —1. That recommended by Marsh, in which the material is treated with dilute sulphuric acid and metallic zinc in

1. Marsh's process.

2. Berzelius's process.

a gas-generating apparatus, when the arsenic combining with hydrogen, forms arseniuretted hydrogen (AsH_3), from which, in the act of escaping, the metallic arsenic, and subsequently A. A., can be obtained; and 2. That known as Berzelius's process, in which dry arsenical compounds are mixed with a reducing flux, and heated in a constricted tube, when the metal arsenic is produced, which in its turn is converted into A. A. by heating in a wide test-tube. The process of Marsh and Berzelius are not so generally followed as that of Reinsch; but in each and all it is absolutely

necessary in order to avoid the possibility of mistake, (1) that metallic arsenic be obtained from the organic mixture; (2) that the metallic arsenic be converted into A. A.; and (3) that this A. A., treated with water, should yield a solution which will give the three liquid tests mentioned previously.

A. A. forms compounds (salts) with alkalies and other bases which are called Arsenites. Some of these are employed in commerce and medicine. A. A., boiled with a solution of potash or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's Solution*. The more largely used sheep-dipping mixtures are composed of A. A., soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of A. A. and the oxide of copper, called the arsenite of copper, or *Scheele's Green*, is a pigment largely used by painters as a pretty and cheap green paint. The same substance is extensively employed in the manufacture of common green paper-hangings for the walls of rooms; and recent inquiries would lead to the belief that rooms covered with paper coated with this green arsenite of copper, are detrimental to the health of human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth Green*, and contains A. A., oxide of copper, and acetic acid, and is a double arsenite and acetate of copper.

ARSENIC (ARSENIOUS ACID), *Properties of, as a Drug*.—A. has long been used as a medicine. When taken into the stomach, it is soon absorbed into the blood, and circulates with that fluid, exhibiting great power over certain diseases, especially skin diseases, as psoriasis, lepra, eczema, (q. v.), &c. It is also classed among the tonic minerals, and given for nervous disorders, especially those that are periodic. Of late it has been much recommended for rheumatism; and Dr Begbie, of Edinburgh, considers that among the remedies for chorea (St Vitus' dance) it holds the foremost place. In ague, also, and remittent fever, as well as in other disorders originating from the same source, A. and quinine are our chief remedies. They are considered to act as alteratives of the blood. The usual method of administering A. is in small doses (from three to five drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in the day. Arsenic is sometimes given combined with iodine and mercury (Donovan's solution).

When given in the doses above mentioned, for eight or ten days, symptoms of poisoning begin to appear; the skin becomes hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in, salivation ensues, and then come nausea, vomiting, diarrhoea, nervous depression, and faintness (Begbie). The quantity necessary to destroy life, of course, varies. Dr Christison records the case of a man who died in six days, after taking thirty grains of the powdered white A.; but a much smaller dose will prove fatal; a girl was killed with two grains and a half of A. contained in two ounces of fly-water. According to Dr Swaine Taylor, a medical witness is justified in stating, that under circumstances favourable for its operation the fatal dose for an adult is from *two to three grains*. Death from a poisonous dose of A. may occur in a few hours, or after the lapse of days. A woman, aged 56, used a solution of A. in water to cure the itch; she experienced severe sufferings, and died after two years,

having had symptoms of arsenical poisoning all that time.

A. has been used frequently as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. Fortunately, in most cases its detection is easy. Orfila found A. in the soil of cemeteries, a fact which has created some discussion among toxicologists. A. is used by anatomists as an antiseptic, but is dangerous, as it is apt to get into cuts on the hands, and under the finger nails, and cause disagreeable symptoms. It is stated that in some countries, especially in Styria, A. is taken by the young female peasants to increase their personal attractions; a statement which probably amounts to this, that experience of its tonic and other qualities induce some individuals to prescribe for themselves a medicine which ought only to be administered by a skillful and cautious hand. That A. can be taken habitually for any length of time, would seem a physiological impossibility; and yet such statements are made on what appears to be unquestionable authority. See *Chambers' Journal*, Vol. V. p. 90, and VI., p. 46; also Johnston's *Chemistry of Common Life*.

No effective chemical *antidote* for A. has yet been discovered. In case of an overdose, or of intentional poisoning, the following treatment is recommended: Evacuate the stomach by the stomach-pump, using lime-water; administer large draughts of tepid sugar and water, chalk and water, or lime-water; avoid the use of alkalies, but administer charcoal and hydrated sesquioxide of iron; bleed freely; take a tepid bath, and use narcotics. If the fatal symptoms be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

ARSINOE, the daughter of Ptolemy I., king of Egypt, and of Berenice, was born about 316 B.C., and married in her sixteenth year to the aged Lysimachus, king of Thrace, whose eldest son, Agathocles, had already wedded Lysandra, the half-sister of A. Desirous of securing the throne for her own children, A. prevailed on her husband to put Agathocles to death; the consequences of which crime, however, were fatal to the Thracian monarch; for Lysandra, having fled with her children to Seleucus in Asia, managed to induce him to declare war against her unnatural father-in-law. Lysimachus was slain, and Seleucus seized the kingdom. A. now sought refuge in Macedonia, which, however, was also taken possession of by Seleucus; but on the assassination of the latter, after a few months, by Ptolemy, Ceraunus, the half-brother of A., she received a hypocritical offer of marriage from Ptolemy, who wanted to destroy her two sons, lest they should prove formidable rivals to his ambition. She consented to the union, and opened the gates of the town in which she had taken refuge, but her children were butchered before her eyes. She then fled to Egypt (279 B.C.), where she married her own brother, Ptolemy II. Philadelphus. These unnatural unions subsequently became common among the Greek kings of Egypt. It does not appear that A. had any children by her brother, though she was regarded by him with the deepest affection. He named several cities, and also an entire district, by her name. After her death, he ordered Dinocrates, the architect, to build a temple to her memory, and roof the edifice with load-stones, so that her iron statue might seem to float in the air.

ARISIS AND THE'SIS (Gr. raising up, and laying down), a term in music applied to the rising and falling of the hand in beating time. It is also applied to the elevation and depression of the voice in speaking.

ARSON, or, as it is called in Scotland, *wilful fire*—

raising, is, in the laws of all civilized countries, a capital crime of the deepest atrocity; for it involves in its consequences not only destruction of property, but also the destruction of, or at least an indifference to, the life or lives of others, which can only be imputed to the most wicked and malignant spirit. In the criminal law of England, it is a felony, and has been described as the malicious and wilful burning of the house or building of another man. It is essential to the offence that the house or building burned should be that of *another*; for although it is a misdemeanour to destroy one's own house by fire, especially in a town, or where other buildings are contiguous, which are thereby put in danger, such an offence does not amount to a felony, strictly so called. To constitute such felony, there must be an *actual* burning; for no intent, however clear, would suffice at common law to support a charge of A. This crime is the subject of two recent statutes (the 1 Vict. c. 89, and the 7 and 8 Vict. c. 62), the provisions of which considerably modify and enlarge the doctrines of the common law on the subject. The first of these acts (amending two others, the 7 and 8 Geo. IV. c. 30, and the 9 Geo. IV. c. 56) enacts that whoever shall unlawfully and maliciously set fire to any dwelling-house, any person being therein, shall be guilty of felony, and shall suffer death. Also that whoever shall unlawfully and maliciously set fire to any church or chapel; or to any chapel for the religious worship of persons dissenting from the United Church of England and Ireland; or to any house, stable, coach-house, out-house, warehouse, office, shop, mill, malthouse, hop-oast, barn, or granary; or to any erection used in carrying on any trade or manufacture, or any branch thereof, whether in possession of the offender or any other person—with intent, in any of these cases, to injure or defraud any person, shall be guilty of felony; and he is liable to penal servitude for life, or not less than fifteen years, or to imprisonment not exceeding three years. Doubts having been conceived upon this act, whether its provisions extended to the setting fire to a hovel or shed not appendant to any house, it was afterwards provided, by 7 and 8 Vict. c. 62, that whoever should unlawfully and maliciously set fire to any hovel, shed, or fold; or to any farm-building; or any building or erection used in farming land—whether the same, or any of them respectively, shall then be in the possession of the offender, or the possession of any other person—with intent thereby to defraud any person, shall be guilty of felony, and he is liable to a like punishment. Moreover, that whoever shall unlawfully and maliciously set fire to any hay, straw, wood, or other vegetable produce, being in any farmhouse or farm-building; or to any implement of husbandry, being in any farmhouse or farm-building; with intent to set fire to such farm-house or farm-building, and to injure or defraud any person—shall be liable to the same punishment as for setting fire to the farmhouse or farm-building itself; and every male so offending, under eighteen, shall be also liable, at the discretion of the court, in addition to any other sentence, to be whipped. Again, unlawfully and maliciously, by any overt act, to attempt to set fire to any building, stack, or steer, or vegetable produce, of such kind and with such intent that if the offence were complete, the offender would be guilty of felony, and liable to penal servitude for life (though such building, stack, steer, or vegetable produce be not actually set on fire), is deemed felony; and is punishable with penal servitude for fifteen years; or imprisonment for two years, with the same addition in respect to whipping, if the offender be a male under eighteen. And lastly, if any person shall maliciously set fire to any station or other building belonging to

any railway, dock, canal, or other navigation, he is guilty of felony; and he is liable to penal servitude for life, or any term not less than three years; or to be imprisoned, with or without hard labor, for any term not exceeding three years; and if any person maliciously set fire to any *goods or chattels*, being in any building, the setting fire to which is made felony by act of parliament, he is guilty of felony; and he is liable to penal servitude for any term not exceeding ten years, nor less than three years, or to be imprisoned, with or without hard labour, for any term not exceeding three years.

Servants convicted of negligently setting fire to houses and buildings, shall, by 14 Geo. III. c. 78, s. 84, forfeit £100, to be distributed among the sufferers, by the churchwardens, in such proportions as to such churchwardens shall seem just; and in case of default, shall be committed to bail or to the house of correction for eighteen months, to be kept to hard labour.

It has been laid down in Scotland, that if the fire has been wilfully kindled, it matters not how circuitous may have been the mode of operation selected, although the injury intended to have been done was not the actual burning of the house, but some inferior mischief. And it is the law of both countries, that if the proprietor of a house set fire to it while in possession of a tenant holding under a lease, the crime of A. is completed; and in Scotland, the same has been ruled where the house was occupied by a party having a life-interest in it.

By the 29 Geo. III. c. 46, an act which applies to Scotland as well as England, it is enacted, that if any person shall maliciously and unlawfully set fire to, or in any wise destroy, any ship or vessel, whether the same be complete or in an unfinished state, or shall maliciously and unlawfully set fire to, cast away, or in anywise destroy any ship or vessel, with intent thereby to prejudice any owner or part owner of such ship or vessel, or of any goods on board the same, or any person that hath underwritten, or shall underwrite any policy of insurance upon such ship or vessel, or on the freight thereof, or upon any goods on board the same; every such offender shall suffer death as a felon.*

Both in England and Scotland, it is a considerable aggravation of the offence where the burning is to defraud insurers.

ART. The word A. is here meant as designating what is more specifically termed *Fine A.*, being opposed to the useful arts, or the industrial operations for supplying the common necessities of life. Painting and Poetry are fine arts; Agriculture, Navigation, and Medicine are useful arts.

The great end of A. is to give pleasure, but the kind of pleasure is peculiar and circumscribed. There are many of our enjoyments that no artist would ever think of attempting to provide. The gratifications of eating and drinking, of exercise and repose, warmth and coolness, form a class in contrast with the pleasures of music, sculpture, or the drama. It is a matter of some nicety to draw the line between these two regions of our pleasurable susceptibility; indeed, it is not clear that a precise line can be drawn. Certain peculiarities can be assigned as disqualifying circumstances, such that any mode of pleasure labouring under them is debarred from entering into A.; but after we have allowed for these, there will remain a disputed border-land, on which no general criterion will hold.

The various indulgences called sensual, are the

* It is curious, as pointed out by Sir Archibald Alison in his work on the Criminal Law of Scotland (vol. i. p. 441), that the subsequent act, 7 and 8 Vict. c. 20, which *re-enacts* the provisions of the above statute, is only applicable to *England*.

best examples of contrast to the pleasures of A. In the first place, as our frame is constituted, these bodily functions, while incidentally ministering to our pleasure, are in the main subservient to maintaining our existence, and being in the first instance guided for that special end, they do not necessarily rank among our gratifications as such; in the second place, they are connected with the production of what is repulsive and loathsome, which mars their purity as sources of pleasure; and in the third place, they are essentially confined in their influence to the single individual; for the sociability of the table is an element superadded. Now, a mode of pleasure subject to one or more of these three conditions may belong in an eminent degree to the list of utilities, and constitute an end of industry, but does not come under the class we are now considering. Wealth is disqualified by the third condition, inasmuch as, while in the shape of money, it is confined to some single proprietor. The same may be said of the pleasures of Power and Dignity. Even Affection is too exclusive to come under the artistic head. Anything so restricted in its sphere of action as to constitute individual property, and give occasion to envy and jealousy, is not a pleasure aimed at by the producer of Fine A.; for there do exist objects that can give us delight as their primary end, that have no disagreeable or revolting accompaniments, and whose enjoyment is not restricted to a single mind; all which considerations obviously elevate the rank of such objects in the scale of our enjoyments. The landscape, the glowing sunset, the song of the lark, the flowers of the field and the garden, yield unalloyed pleasure, and create no monopoly. The painter, sculptor, and musician aim at corresponding effects.

The eye and the ear are the chief avenues of artistic delight; the other senses are more or less in the monopolist interest. Moreover, one important feature in the somewhat capricious attribute termed *refinement*, attaches more particularly to the objects of these two senses; namely, the power of protracted enjoyment without fatigue. A *coarse* effect is one that is intense and pungent, but too exhausting to be kept up; such is a noisy clash of loud instruments in a musical performance, or a tale of overdone marvels. To remove all the fatiguing accompaniments, and thereby tone down the exciting influence, while retaining as much as possible the really pleasurable part, is to refine upon the effect, and produce a higher work of art. Now, in the sensations of taste and smell generally, the stimulus is apt to be of short duration; the pleasure is said to pall soon. Yet there are degrees in the case; some of the choicer odours can affect us for hours together with a gentle and pleasing sensation. But it is the ear, and perhaps still more the eye, that can remain open to agreeable stimulation for the greatest length of time; and taking this fact along with the unconsuming nature of their objects, we see good reasons for the artist striving so earnestly towards the gratification of those two senses.

The sensual elements can be brought into A. by being contemplated in the *idea*, in place of being enjoyed in the reality. A painter or poet may depict a feast to our minds, and impart a pleasure that differs essentially from the delights of eating and drinking. The imagined repast has nothing to do with our bodily necessities; the disagreeable accompaniments can be kept out of view; and any number of persons may share in the effect. So with the elements of wealth, power, dignity, and affection, which in their actuality want the liberal character of the true artistic delight; if we can only derive pleasure from the spectacle of them in the hands of the select number of their possessors, they become

to us an enjoyment that can be shared by the general multitude, like the blue sky, or the towering peak. It is the fact that mankind find a charm in contemplating the wealthy, the powerful, the elevated, the illustrious, the beloved; and accordingly such elements are freely adopted into artistic compositions.

If all the sensual gratifications could become artistic by being contemplated in idea, or merely thought of, as in the above case of imagining a rich feast, we should have the means of distinctly circumscribing the select region of the beautiful or artistic, and of resolving a difficult problem. It would be admissible for the poet or painter to suggest any of those inferior pleasures to the mind by descriptive touches, and he would thereby elevate them into the region of art. But we find that every mode of sensual gratification is not open to this ideal representation. Even as regards eating and drinking, exception is taken against the too free allusion to those pleasures; while the sensuality of love is hardly to be suggested through the most distant allusion. We may revel in tales of mere tender emotion—of parental love and of pure affection—but those other subjects are kept at the utmost distance; and we should be said to be revelling in sensuality, if we were merely to indulge in the imagination of those species of delight. There is no help, therefore, but to consider that there are *conventional* and arbitrary limitations of the sphere of the artist, rendering it quite impossible to draw any clear and universal boundary-line between the beautiful and the agreeable generally.

Sublimity, Beauty, Grace, Harmony, Melody, Pathos, Ideality, Picturesqueness, Proportion, Order, Fitness, Keeping, and the Ludicrous—though they do not all relate to the so-called *beautiful*, are all involved in the circle of pleasures now before us; and it is quite obvious that no one fact can run through this variety of designations. There must be a great multitude of agents operating to produce these different impressions, which are related to one another only by attaching in common to the æsthetic class of compositions. Doubtless, several of these names may be employed to mean the same thing, being, in fact, partially synonymous terms; as Beauty and Grace—Proportion, Fitness, and Keeping; but hardly any two terms are synonymous throughout, and there are distinct conceptions implied in Sublimity, Beauty, Picturesqueness, Fitness, and the Ludicrous.

Among the elementary sensations and emotions of the human mind that are of a pleasurable kind, a certain number may enter at once into the composition of A.; such are the pleasures of sound and sight, the emotion of surprise, and plot-interest. Others may enter by ideal presentation; as the gratifications of the remaining senses, and the emotions of fear, tenderness, irascibility, power. The feelings more specific to A. are those produced by Harmony under its various aspects. When sweet sounds are harmoniously combined, we have the musical art; the painter has a similar aim in reference to colours and forms; and so through all the Fine Arts, this quality is found recurring as the crowning work of the artistic hand. Nothing is so indisputably included within the circle of the æsthetic or beautiful as finely struck harmonies, melodies, or concords. Whatever else may be included in a composition, it is the admission of these that gives the specific charm, although it would be a mistake to dispense with other elements of interest common to art and to every-day life. Story is essential to Romance and Poetry; sweetness in the separate sounds is requisite for good Music; and colour in itself imparts æsthetic pleasure apart from harmonious union.

The agreeable effect designated by Fitness takes

rank with the artistic pleasures; we may call it the æsthetic of the useful. When a work is not only done effectually, but done with the appearance of ease, or the total absence of restraint, difficulty, and pain, we experience a delight quite different from the satisfaction growing out of the end attained. Much of the pleasure of architectural support is referable to this source.

Among the susceptibilities touched by artistic arrangements may be noticed the sense of Unity in multitude, arising when a great number of things are brought under a comprehensive design, as when a row of pillars is crowned by a pediment. The use of simple figures—the triangle, circle, square, &c.—for enclosing and arranging a host of individuals, has the tendency to make an easily apprehended whole out of a numerous host of particulars. In all large works abounding in detail, we crave for some such comprehensive plan, whereby we may retain the total, while surveying the parts. A building, an oratorio, a poem, a history, a dissertation, a speech, should have a discernible principle of order throughout; the discernment of which gives an artistic pleasure, even in works of pure utility.

The craving for Variety and Novelty is a powerful impulse of the human mind, and makes itself especially apparent in the appreciation of works of Art. The greatest works cease to please after a time, and temporary fashion may occasionally lord it over the perennial in taste.

In looking at the Fine Arts individually, we may divide them into two classes, by drawing a distinction of some importance as regards the question of an artistic *standard*. The one class contains the *effusive* arts, or those which consist of mere outbursts of the inward spontaneity, regulated by the effect of the display on the sense of the beholder or listener. Music is a good example. The spontaneous effusions of the human voice, and those prompted by the various emotions, are corrected and tuned by the ear into melody and harmony, and after this process has been often repeated, pleasing airs and compositions are the result. It is the same with the Dance, considered as a fine art. In like manner, dramatic gesture and display, and the graces of elocution and fine address, are the natural promptings rendered pleasing by being changed and modified for that express end. The first movements are mere random, but the delicate sensibility of the beholder causes some to be suppressed, and others brought out, until a really pleasing combination is attained. Contrasted with the purely effusive, are the so-called *imitative* arts, or those that involve the representation of some of the appearances of the outer world. Such are Painting, Sculpture, and Poetry. In these, the artist, while still aiming at pleasing effects, is trammelled with a new condition—namely, a certain amount of fidelity to his original. In the others, there are no originals. The musician imitates nothing, and is bound by the sole condition of gratifying the ear; but a painter chooses his subject from nature, and although he must contrive to yield the pleasures of colour, outline, and grouping, he must do so with a certain respect to the object copied. The poet, in depicting the life of men, comes under the rule of fidelity to this extent, that an obvious misrepresentation is apt to give a painful shock, and mar the pleasure that would otherwise be derived from the poetry itself. It is not so much that truth is a part of the artistic pleasure, as that falsehood is a stumbling-block in the way; for even the imitative arts are only so in part. There is no imitation in the metre and cadence of a song, and yet these often constitute the main charm. So a certain licence of fantastic effusion is allowed to poets, subject to no rules but

the giving of pleasure. The creation of imaginary worlds, when avowed, is not objected to; and the criterion of fidelity to the actual is accordingly laid aside for the time. The various arts of Decoration and Design are for the most part effusive, although occasionally imitative. Architecture is not in any way imitative; the coincidence between the Gothic roof and the intermingling foliage of a double row of trees, is a mere accident.

These observations are necessary in order to qualify the current maxim, that Nature is the artist's standard, and Truth his chief end; conditions that, in their strictness, apply only to science. It is the scientific man that should never deviate from nature, and should care for truth above every other consideration. The artist's standard is *feeling*, his end is refined pleasure; he may go to nature, but it is to select what chimes in with his feelings of artistic effect, and pass by the rest. He is not bound to adhere to nature even in her choicest displays; his own taste being the touchstone, he alters the originals at his will. The student of science, on the other hand, must embrace every fact with open arms. If a nauseous fungus or loathsome rat meet the eye of a naturalist, he is bound to record it as faithfully and minutely as he would dilate on the violet or the nightingale. When a painter adopts the human figure as a basis for setting forth harmonies of colour, beauties, and form, and picturesqueness of grouping, he ought not to jar our sense of consistency by a wide departure from the usual proportions of humanity. Still, we do not look for anatomical exactness; we know that the studies of an artist do not imply the knowledge of a professor of anatomy; but we expect the main features of the reality to be adhered to. In like manner, a poet is not great because he exhibits human nature with literal fidelity; to do that, makes the reputation of a historian or mental philosopher. The poet works by his metres, his cadences, his touching similes, his graceful narrative, and his exaltation of reality into the region of ideality; and if in all this he avoids serious mistakes and gross exaggeration, he succeeds in his real vocation.

The attempt to reconcile the artistic with the true—art with nature—has given birth to a peculiar school, in whose productions a restraint is put upon the flights of pure imagination, and which claims the merit of informing the mind as to the realities of the world, while gratifying the various emotions of taste. Instead of the tales of Fairyland, the Arabian Nights, and the Romances of Chivalry, we have the modern novelist, with his pictures of living men and manners. In painting, we have natural scenery, buildings, men, and animals represented with scrupulous exactness. The sculptor and the painter exercise the vocation of producing portraits that shall hand down to future ages the precise lineaments of the men and women of their generation; hence, the study of nature has become an element in artistic education; and the artist often speaks as if the exhibition of truth were his leading purpose. It is probably this endeavour to subject the imagination more strictly to the conditions of truth and reality, that has caused the singular inversion whereby the definition of science is made the definition of art.

But while fidelity, in the imitative class of arts, is to be looked upon, in the first instance, as avoiding a stumbling-block rather than constituting a charm, there are still certain ways wherein we derive from it a sort of pleasure that may be called æsthetic. We feel drawn by fellow-feeling towards one who has attended to the same objects as ourselves, or who has seized and put into vivid prominence what

we have felt, without ever having expressed. The coincidence of mind with mind is always productive of the agreeable effect of mutual sympathy, and, in some circumstances, there is an additional effect of pleasing surprise. Thus, when an artist not merely produces in his picture those features of the original that strike every one, but includes all the minuter objects that escape the notice of the generality, we sympathise with his attention, we admire his powers of observation, and become, as it were, his pupils, in extending our study and knowledge of nature and life. We feel a pungent surprise at discovering, for the first time, what has been long before our eyes; and so the minute school of artists labour at this species of effects. Moreover, we are brought forward as judges of the execution of a distinct purpose; we have to see whether he that is bent on imitation does his work well or ill; and if our verdict is favourable, our admiration is excited accordingly. There is, too, a certain exciting effect in the reproduction of some appearance in a foreign material, as when a plain surface is made to yield the impression of solid effect, and canvas or stone imitates living humanity. Finally, the sentiment of reality and truth, as opposed to fiction or falsehood, appealing to our practical urgencies, disposes us to assign a value to every work in which truth is strongly aimed at, and to derive an additional satisfaction when fidelity of rendering is induced upon the charms peculiar to A. Thus imitation—which, properly speaking, is a mere accident attaching to Sculpture, Painting, and Poetry, and has no place in Music or Architecture—may become the centre of a small group of agreeable or acceptable effects. These effects are the more prized, that we have been surfeited with the purely æsthetic ideals. We turn refreshed from the middle-age romance to the graphic novel of our own time.

Besides being a source of pleasure, art is frequently spoken of as having an elevating and refining influence on the mind and character; for which reason it is considered a proper object of public encouragement in civilised communities. This circumstance is owing to the higher nature of artistic pleasure as above described, the taste for which helps to rescue mankind from the exclusive dominion of sensual and selfish enjoyments. At the same time, we must admit that the devotion to art may be itself excessive, and have the effect of withdrawing men too much from the urgency of practical life, rendering them a prey to political despotism, as well as indifferent to moral principle. Instances are not wanting to justify this remark.

See Dugald Stewart's *Philosophical Essays*, Part II., and Bain on the *Emotions and the Will*, p. 247.

ART, HISTORY OF. The history of the origin and development, growth and decline of beautiful artistic forms, constitutes a portion of the history of civilisation. As regards each particular people, the history of their efforts to conceive and express absolute perfection, or what is commonly called ideal beauty, in form and colour is, with the single exception of the history of their speculative opinions, the most reliable test of the stage of progress which they have attained. Nor is it as an indication of their command over physical nature, of the abundance of their external resources, or even of their intellectual activity alone, that the history of the art of a people is thus important. It determines their moral, and even, in a certain sense, their religious position, for the inseparable connection between the beautiful and the good is in no way more clearly manifested than in the fact, that the first inroads of demoralisation and social disorder are invariably indicated by a diminution in the strength and purity of artistic forms. It has been usual to include under the term history of art merely the history of the arts of form,

including architecture, but excluding, of course, poetry and music, though these latter, again, are generally included when we speak of the fine arts. See ART.

The classical nations of antiquity were not insensible to the importance of tracing the development of that rich artistic life which they had originated, and we accordingly find the germs of artistic history in Pliny, Quintilian, Pausanias, and others. In the middle ages, every trace of a general historical treatment of art disappears, though casual remarks and incidental notices on the subject of artists and the arts are abundant, particularly in such works as the *Liber Pontificalis* of Abbot Anastasius (q. v.), who is commonly known as 'the Librarian,' in consequence of his having filled that office at the Vatican in the 9th c. But a history of art, in the sense which we have here assigned to the term, made its appearance in the world for the first time on the revival of letters, in the 15th and 16th centuries; when the artistic treasures of the heathen world, which had come upon mankind as novelties, fell to be contrasted with that peculiar type which art had assumed under Christian influences during the middle ages, on the one hand (see BYZANTINE ART), and on the other with that rich harvest of fresh invention which ripened during the long lives of Leonardo da Vinci (q. v.) and Michael Angelo (q. v.), in the period of which Raphael's (q. v.) short career may be regarded as the noon-day. Whilst Vassari (q. v.) traced the great epochs of Italian art, from a biographical point of view only it is true, in his celebrated work; the students of classical literature collected such expressions of opinion on artistic subjects as the writings of the ancients contained, and Palladio, Ligorio, Vignola, and others, measured ancient buildings and their constituent members. In this way a vast mass of information on artistic subjects was brought together. But though the materials which might have served for a history of art were thus supplied, it was a long time afterwards before anything like proper historical treatment arose; and the knowledge of ancient art which had been gained, was applied to their respective purposes by artists on the one hand, and philologists on the other. As regarded modern art, the biographical method of Vassari was adhered to, and to this circumstance we are indebted for the innumerable artistic anecdotes which have been preserved. The remarkable variations in style which exhibited themselves between the 16th and 18th centuries, gave rise to a species of historical treatment which had for its object the discovery of the common features by which the artists of the respective periods were distinguished. But the history of style, strictly speaking, begins with Winckelmann (q. v.), who was the first to divide ancient art into epochs, and to trace its connection with the general history of human progress. It was from this period that the history of art came to be regarded as a branch of the history of civilisation. Even where the biographical method continued to be followed, it was henceforth with this difference, that the division into schools took the place of mere chronological arrangement. The strongly classical tendency which exhibited itself towards the end of the last century, and the romantic reaction and consequent admiration for the middle age which succeeded, though both must be regarded as one-sided influences, had an unquestionable effect in calling attention to what was really great in the artistic productions of these respective periods; and during the present century, the history of art has gradually assumed a more important place as a department of general history. It was only in very recent times, however, that a complete artistic history appeared in Kugler's *Handbook of the History of Art*, which has been partially

translated into English, and edited by Sir Charles Eastlake. In the original work, which is very excellent, the immense mass of material which the subject offered has been arranged into periods, and treated in such a manner as to present a sketch which is complete in itself, whilst at the same time its connection with and dependance on general history, social, political, and philosophical, are carefully indicated throughout. Alongside of Kugler's history, that of Schnaase falls to be mentioned—a work less directed towards completeness of narration than to a philosophical and historical account of the origin of the various styles, and their connection with each other. Kinkel's history of Christian art has unhappily remained incomplete. Waagen's works on art and artists in England, France, and the other countries by which Germany is surrounded, are the best artistic handbooks for the traveller. Those which have reference to England have been translated. There are many other historical works of importance on special departments and separate schools of art, monographs and the like, but, with the exception of Stirling's *Annals of the Artists of Spain*, and *Velasquez and his Works*, very few belong to our own literature.

ART EXHIBITIONS. Public displays of the works of living artists, with the view of affording gratification and instruction to the community on the one hand, and on the other, of procuring purchasers for the works exhibited, have taken place in most of the principal towns of Europe, for more than a century and a half. Though now for the most part connected with Art Unions (q. v.), A. E. are thus in reality much older institutions. Still, as the offspring of a necessity which did not exist in earlier times, they are essentially modern. So long as artists were chiefly patronised either by the church, by their respective governments, or by individuals of sovereign rank, their works were placed either in churches, in public buildings, or in palaces, and were thus continually exhibited to the public; but when private patronage came to be their chief support, and their works, if sold at all, were certain to be buried in private houses, the necessity for making arrangements by which they could be displayed to the public either before they were disposed of, or afterwards with the consent of their owners, became apparent. We have mentioned under Art Unions that, till aided by these latter institutions, A. E. for the most part did not succeed in effecting the objects which their promoters had in view. The earliest collective art exhibition was probably that of the members of the Academy of the Fine Arts, at Rome; anything of the kind which had previously existed being confined to the works of a particular artist and his pupils, enriched perhaps by a few contributions from his friends. Something of this earlier character probably attached to these Roman exhibitions; and the first art exhibition, in the sense in which we now understand it, seems to have been that of the French Academy in 1673. From 1745, down to the period of the Revolution, this exhibition, which from its commencement had been confined to the works of members of the Academy, took place biennially. During the Revolution it was thrown open to foreign artists, and in 1796 it was again made annual. An exhibition was attempted in England in 1760, but it was not till 1796 that the regular exhibitions of the Royal Academy commenced. They have since gone on, not only without interruption, but with increasing energy. The number of works exhibited in 1760 was only 130, the number of exhibitors being 69; in that of 1859 there were works exhibited by 918 artists. The annual revenue which the Academy derives from the fee of one shilling paid by each visitor has also been steadily

increasing; in 1855 it amounted to about £8000. The exhibition of the Scottish Academy, which is the second in importance in this country, has existed since 1826. To the first exhibition, 178 works were sent by 27 contributors; the exhibition of 1859 consisted of 745 works, which were contributed by 291 artists. The annual revenue of the Scottish Academy derived from this source exceeds £2000. The only other exhibition of the same class in the United Kingdom is that of Dublin, which is supported by an annual grant from Government—the exhibitions of London and Edinburgh being merely furnished with rooms erected at government expense. Several private societies in London, however, have exhibitions for similar objects, and conducted on similar principles. Of these we may mention the British Institution, the Society of British Artists, the National Institution, the Society of Painters in Water-colours, and its rival, the New Society of Painters in Water-colours. There are also exhibitions in several of the large provincial towns, such as Manchester, Liverpool, Glasgow, &c. On the continent, wherever an academy of art exists, there is now an exhibition, which takes place for the most part annually, but sometimes biennially. In New York there is a permanent exhibition of the works of Düsseldorf artists; and from thence they are frequently carried for exhibition to the provincial towns of the Union.

The London Exhibition of 1851, commonly known as the *Great Exhibition*, was not only on a larger scale, but introduced new features into these displays. Though confined to industrial objects and works of plastic art, it gave an impulse to A. E. strictly so called, which shewed itself almost simultaneously in the great international artistic exhibition of Brussels; and even those exhibitions which have been formed more closely on its model—those of Dublin in 1853, and of New York in the same year—have not included the fine arts in any of their forms. See EXHIBITIONS.

ART UNIONS. These institutions, which have for their object the promotion of a livelier interest in, and more liberal patronage of, the fine arts on the part of the general public, have gone far in modern times to supply the place of that encouragement which, at an earlier period, they received from princes and prelates.

The origin of A. U., though claimed by the Germans, seems really to belong to the French, and to be traceable to the stirring days of the first Napoleon. From France they passed over into Belgium, where they at once took root, and established themselves even in the less important towns, ten years before they were introduced into Germany. The Art Union of Malines dates from 1812, which is eleven years anterior to that of Munich. But it was in Germany that the importance of the results which A. U. were capable of producing first became apparent, and it was from Germany that they were carried into England. The Art Union (*Kunstverein*) of Munich was established in 1823, and became the model of most of those which afterwards arose. The example of Munich was speedily followed (at the suggestion, we believe, of no less distinguished a personage than Alexander von Humboldt) by Berlin, and shortly thereafter by Dresden, Leipsic, Breslau, Halberstadt, &c.; and in less than ten years there were few of the larger towns of Germany in which A. U. were not to be found. But the most important of all the A. U. of Germany, is that which was established at Düsseldorf in 1829, for the Rhine provinces and Westphalia. The Düsseldorf Association has aimed at higher objects than A. U. have usually had in view, either in Germany or in England, and has been instrumental in promoting the execution of monumental works of art of the highest

class. In the space of twenty years from its institution (1849), it had expended on works of art what in Germany was regarded as the enormous sum of 268,000 thalers, equivalent to about £40,200 sterling; and had been the means of placing 24 altar-pieces in churches, eleven paintings on a large scale in public buildings, of which the frescoes in the council chambers at Elberfeld and at Aix-la-Chapelle may be mentioned as examples. The Association of Düsseldorf also publishes an artistic periodical (*Correspondenzblatt*). Other associations have imitated, not without success, the Association of Düsseldorf in directing their attention to the promotion of great works. The Bohemian Association at Prague has been peculiarly meritorious in this respect; and those of Berlin and of Cologne deserve the highest commendation for the zeal with which the first promoted the erection of Kiss's magnificent group of the Amazon on the steps of the Museum at Berlin, and the second urged on the completion of what already, in its half-finished condition, is the greatest architectural monument of Northern Europe—the cathedral of Cologne. The establishment of permanent galleries of art in the cities to which they respectively belong, is also regarded in Germany as one of the higher objects of A. U.; and in this they have been recently followed in this country, as, for example, in Edinburgh. In Munich there is already a very noble collection of modern works of art, which have been brought together in this manner; and another of the same description is in course of formation in Berlin. Association galleries also exist in Dresden, Leipsic, Breslau, Stettin, &c. Groups of associations have also been formed in Germany for the promotion and encouragement of extensive works. The western group, or cycle, as it is called, includes Hanover, Halberstadt, Magdeburg, Halle, Gotha, Brunswick, and Cassel; the eastern, Danzig, Königsburg, Stettin, &c. This arrangement, by which the influence of these associations on the highest class of art must be vastly augmented, seems worthy of imitation in this country.

Scotland, as is not unusual where the suggestion comes from a continental source, preceded England in the establishment of A. U.; the first that was formed in Britain being that of Edinburgh in 1834. The cause of its introduction was not so much the hope of bettering the condition, as the necessity of preventing the utter extinction of everything beyond mere imitative art. Portrait-painting continued to furnish the means of living to those who practised it with success; and those who represented familiar occupations or popular customs, obtained a more limited encouragement; but it was found that precisely as the artist rose in the scale of artistic endeavour, and tended in the direction of ideal art, the sympathy and interest of his countrymen, and consequently his own remuneration, declined. The Royal Academy of London, and the academies which had been formed after the same model in Edinburgh and in Dublin, notwithstanding the annual exhibitions which they have instituted, had entirely failed to remove this evil. Private purchasers were not to be found; and in Edinburgh it was calculated that never more than £800, and sometimes as little as £35, were expended in the purchase of pictures exhibited by the Academy, and even these insignificant sums were usually paid for pictures of the very lowest class. Elsewhere, matters were even worse. Mr. Cash, a witness examined before the select committee of the House of Commons on A. U. in 1845, stated that previous to the establishment of the art union in Dublin, 'in four years, during the exhibition of the works of the Royal Hibernian Academy, 30s. only were expended on the patronage of art.'

'Thirty shillings annually,' asked the chairman. 'No,' replied the witness; 'thirty shillings was the entire sum expended in the four years.' The success of the Scottish Association was immediate; and to its founders the public are in no small degree indebted for the rapid progress which art has made in this country during the last twenty years. 'A large annual fund,' says the secretary, in his statement to the above-mentioned committee, 'exclusively devoted to the purchase of paintings and sculpture, and to the dissemination of engravings, was speedily realised, which in the course of nine years amounted to not less than £36,900. During the same period, 771 paintings, 40 pieces of sculpture, and about 30,000 impressions from engraved plates, were distributed among the members of the Association.' Since this period, the annual funds of the Edinburgh Association have continued steadily to increase; and its promoters, as the result of their disinterested labours, have had the satisfaction to see a school of art spring up around them which is probably second to those of Munich and Düsseldorf alone. Our limits preclude us from entering into the history of the other societies in Britain which have been formed after the model of the parent institution of Edinburgh; but some conception of the success which has attended them may be gathered from the fact, that in 1856 it was calculated that they had expended not less than the enormous sum of a million sterling on the encouragement of art. In addition to this direct expenditure, what is a very remarkable, and was to most persons probably an unexpected result, was, that the patronage of private individuals, in place of diminishing, greatly increased, both in Edinburgh and London, during the period in question. Before concluding our sketch of the rise of these very remarkable institutions, it is proper to mention the art union of New York, established in 1838, which now supports two galleries with works of art in that city, and the members of which have had the wisdom to establish an intimate relation and lively interchange of works between their own institution and that of Düsseldorf.

As regards the constitution of A. U., the following arrangements may be stated to be common to them all. Each member, in return for an annual contribution (in Britain, usually a guinea), receives an acknowledgment, which acts as his ticket in the lottery by which the works of art, purchased with the sum thus contributed, are distributed amongst the members. Generally, a fixed proportion of the contributions is retained and devoted to the preparation of an engraving, which is presented to those who have drawn blanks in the lottery. The engraving is usually executed by a local engraver, after a work of the local school intended to be patronised. The association further makes provision for an exhibition, either permanent, as at Munich, or annual, as in London and Edinburgh, consisting mainly of the works of local artists, though most associations now admit those of strangers. A diversity of practice has existed as to the mode of distributing the funds of the unions, and much controversy has taken place between their respective partisans. The first, common on the continent, and adopted in Edinburgh, consists in putting the whole sum collected for each year into the hands of a committee of gentlemen, who are chosen for their supposed æsthetic acquirements and impartiality, and requesting them to select the pictures and other works of art afterwards to be distributed to the subscribers by lot; the second is the London plan of distributing the money itself by lot, and then permitting, or rather compelling, the prize-holders to expend it on the pictures exhibited, the selection of the pictures, however, being left to their own taste

and judgment. If the object of these institutions be to cultivate an artistic taste *higher* than that which exists in the general community for the time being, the advantages of the first over the second of these modes of distribution seem scarcely to admit of question. The subject was eagerly canvassed before the select committee to whose labours we have already referred, and their report was to the effect that the constitution of the Edinburgh Association was preferable to that of the London Union. The principle of the A. U., under some modifications, but retaining the distribution of prizes by lot, has been extended to the patronage of art manufactures, but not hitherto with the success which has attended it when limited to the fine arts, strictly so called. See EXHIBITIONS.

A'RTA, the ancient *Ambracia*, a town of Albania, in lat. 39° 8' N., and long. 20° 50' E., seven miles from the northern coast of the gulf to which it gives name, and thirty-nine miles south from Janina. It stands on the left bank of the river Arta, the ancient *Arachus*, whence the modern name. It is the see of a bishop, and is governed by a bey. It has a considerable trade, and some manufactures, chiefly of cloths and leather; the floccata, or 'shaggy capote,' alluded to in Byron's earlier poems, is greatly esteemed; but the town has never recovered from the disasters of 1828, when it was stormed by the Greek patriots under Marco Botzaris. Portions of the old walls, which were of great strength, and the foundations of the Acropolis, are the only relics of Hellenic times. Remains of the lower empire exist in a convent founded 845 A.D. by the Empress Theodosia.

The ancient city of Ambracia, founded by a Corinthian colony about 635 B.C., was at one time a flourishing independent state, with a considerable territory. It was ruined in the struggle with the Amphilocheians, and subsequently became subject to Philip of Macedon. Pyrrhus made it the capital of Epirus, after which it fell into the hands of the Ætolians, and lastly of the Romans.

A'RTA, GULF OF, an arm of the Ionian Sea, 25 miles long and 10 wide, forming part of the boundary between Turkey and Greece. Under its ancient name of the Ambraciot Gulf (*Sinus Ambracius*), it separated Epirus and Acarnania. At its entrance on the south is the promontory of La Punta, the ancient Actium (q. v.).

ARTABAZUS, the name of several distinguished Persians in the times of the Achæmenidæ. When Xerxes advanced against Greece, A. led the Parthians and Chorasmî. At a later period he warned Mardonius, but in vain, against engaging in battle at Platæa; and on the first indications of defeat, he withdrew his own division, amounting to 40,000 men, from the field, and succeeded, though with great difficulty, in forcing his way through the wilds of Thessaly, Macedonia, and Thrace to Byzantium, where he crossed to Asia. Subsequently, he acted as negotiator between the Spartan Pausanias and Xerxes.—Another A. was general under the Persian king, Artaxerxes Mnemon, and revolted against Artaxerxes Ochus in 356 B.C. For this offence he appears to have been forgiven; and subsequently we find him accompanying King Darius after the battle of Arbela. Alexander rewarded his fidelity by appointing him satrap of Bactria.

ARTANTHE. See MATICO.

ARTAXERXES, the name of several Persian kings. A. I., surnamed *Longimanus*, the second son of Xerxes, escaped from the conspiracy of Artaban and others, and ascended the throne in 465 B.C. His long reign, extending to 425, was marked by a decline of power.—A. II., surnamed *Mnemon*,

succeeded his father, Darius II., in 405 B.C. After gaining the victory over his brother Cyrus, he became involved in war with Sparta, which ended with the Antalcidean Treaty of Peace. He died in 361.—A. III., surnamed *Ochus*, was the son and successor of the former, and reigned in the true style of oriental despotism until 338 B.C. One of his most daring exploits took place in Egypt, where he caused the divine bull Apis to be slaughtered and cooked as ordinary beef. A. III. was poisoned in 338 by his eunuch Bagoas. It is said that his flesh was eaten by cats, and that hilts for scimitars were made of his bones.—The founder of the new Persian dynasty of the Sassanidæ (which ruled from A.D. 226 to 651) was named A.

ARTEDI, PETER, a celebrated naturalist, was born on the 22d of February 1705, at Anund, in the province of Angermannland, Sweden. He was at first designed for the church, and entered the university of Upsala, intending to pursue the usual course of philosophy and theology; but he soon abandoned all thought of the ministry, and betook himself to medicine. In 1728, Linnæus went to Upsala, to study the same science, and a close intimacy sprang up between the young men. They worked together, and to a certain extent, on the principle of a division of labour. Physiology, chemistry, and mineralogy they pursued in common; but to this A. added ichthyology, and Linnæus ornithology and entomology. In 1734, A. sailed for England, and Linnæus went to Lapland, each having made the other his heir and executor of all his scientific documents. While in London, A. wrote the preface to his *Ichthyologia*. Next year he went to Leyden in Holland, where he found Linnæus just arrived from the north. Each shewed the other the results of his labours. A.'s useful career was abruptly ended, on the 21st of September 1735, by his falling into one of the canals near Amsterdam.

A.'s only complete work is the *Philosophia Ichthyologica*. The *Synonymologia* is described as a work of extraordinary labour, but somewhat confused Linnæus faithfully performed his duty as his friend's executor. He arranged, corrected, and completed his manuscripts, and published the whole, together with a life of the author, in 1738. According to Cuvier, the great work of A. is the first named, which gave a truly scientific character to the study of fishes. The only error of any magnitude which occurs in it is including the Cetaceæ among fishes. A. was also a distinguished botanist. He was the first to indicate, as a special characteristic, the presence or absence of involucre in the umbelliferous plants, whose species are so difficult to distinguish from each other. Linnæus has called a genus of these, in memory of his friend, *Artedia*.

ARTEMISIA queen of Caria (352—350 B.C.), was the wife of Mausolus, and is celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory. See MAUSOLEUM.—Another A., queen of Halicarnassus, accompanied Xerxes in his expedition against Greece, and distinguished herself at the battle of Salamis (480 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

ARTEMISIA, a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, in which the flowers of the disk are hermaphrodite, those of the ray in one row, the bracts forming a roundish imbricated head, the receptacle naked or hairy, the achænia obovate, and destitute of pappus. The heads of flowers are numerous and small; the leaves generally much divided. There are many species, herbaceous plants and shrubs, natives chiefly of the

more temperate regions of the eastern hemisphere. They have generally an aromatic smell, more or less agreeable, and a warm, sometimes rather acrid and bitterish taste.—To this genus belongs WORMWOOD (*A. Absinthium*), the *Apsinthion* of the ancient Greeks, to whom its medicinal properties were well known. It is a native of Britain, the continent of Europe, and the northern parts of Asia, growing in waste places, by waysides, &c. It is a perennial, 2–4 feet high; its leaves bipinnatifid and clothed with a silky down, and its small hemispherical drooping heads of flowers are of a dingy yellow colour, and are produced in axillary panicles. It is aromatic and bitter, containing a bitter principle and an essential oil, both of great strength, upon account of which it is used in medicine in various forms (oil, extract, tincture, &c.), as a stomachic and anthelmintic or vermifuge. It was formerly in much use as a febrifuge. It is a plant very frequently to be found in cottagers' gardens, occupying an important place in their domestic pharmacopœia. It is an essential ingredient in a number of compound medicines. Its roots, and those of some other species of this genus, have been recommended in epilepsy.—SEA WORMWOOD (*A. maritima*), including a variety which has been called *A. Gallica*, a native of salt-marshes in Britain and other parts of Europe, possesses similar properties, and is occasionally used for the same purposes; as also ROMAN WORMWOOD (*A. Pontica*), a native of the middle and south of Europe, but not of Britain—TARTARIAN WORMWOOD (*A. Santonica*), a native of Tatar, Persia, and other parts of the East; and INDIAN WORMWOOD (*A. Indica*), a native of the Himalaya, abounding at

Wormwood (*Artemisia Absinthium*).

elevations of 2000–6000 feet. Indian wormwood grows to the height of 12 feet. It is considered in India a powerful deobstruent and antispasmodic. TREE WORMWOOD (*A. arborescens*), a native of the south of Europe and the Levant, is also larger and more shrubby than the common wormwood, which, in characters and qualities, it much resembles.—The dried flower-buds of a number of species of *A.* are sold under the names of WORMSEED and of *Semen Contra*, *Semen Cina*, *Semencine*, &c., and have long

been in much repute as an anthelmintic. *A. Santonica*, and *A. Sieberi* (or *A. Contra*), a native of Palestine, are believed to yield much of the wormseed which is brought from the Levant, also *A. Judaica*, a native of the East and of Barbary, which is regarded as the principal source of the Barbary wormseed. The flower-buds of *A. glomerata*, *A. Lerchiana*, and *A. pauciflora*, natives of the banks of the Volga, are also said to form part of the wormseed of the shops; and those of *A. Vahliana* are collected in the north-east of Persia, and form the *Semen Cina Levanticum* or *Semen Cina in grains*. The flower-buds of *A. carulescens*, a Mediterranean plant, which is said to have been found on the sea-coast of England, form the anthelmintic called *Semen Seriphii* or *Barbotine*. Those of *A. camphorata*, another native of the south of Europe, are used in the same way. Even those of *A. Absinthium* and *A. vulgaris* are used under the name of wormseed.—The plants from which the bitter aromatic liquor called *Extrait*, *Eau*, or *Crème d'absinthe* is prepared, are small low-growing species of *A.* *A. mutellina*, *A. glacialis*, *A. rupestris*, *A. spicata*, &c.), found on the Alps, and known to the inhabitants of the Alps by the name of *Genipi*. This liqueur, generally diluted with water, is sometimes used by persons so devoted to the pleasures of the table that they cannot wait for the natural return of appetite, and also by those who really suffer from weakness of digestion. It is a useful and agreeable stomachic, and is very popular in France.—MUGWORT (*A. vulgaris*), a common native of Britain and of the continent of Europe, often found about ruins and in waste places, grows to the height of 3–4 feet, with pinnatifid leaves and somewhat racemed small flowers, which have each five florets of the ray. It emits, when rubbed, an agreeable smell, and has a bitter taste. In Germany, the young shoots and leaves are used in cookery for seasoning. It is used also for the same medicinal purposes as wormwood, but is weaker. Its leaves, and those of some of the other species, are used as fomentations for cleansing and healing wounds.—SOUTHERNWOOD (*A. Abrotanum*) is a shrubby plant with long straight stems, 3–4 feet high, the lower leaves bipinnate, upper leaves pinnate, their segments hair-like. It is a native of the south of Europe and middle parts of Asia, and has long been a favourite plant in cottage-gardens in Britain. It has an aromatic and pleasant odour. The leaves are used to drive away moths from linen; and in some parts of the continent of Europe, as an ingredient in the manufacture of beer. The smell of this plant appears to be peculiarly disagreeable to bees, which retreat from it; and a little branch of southernwood is sometimes efficaciously used when they are swarming, to promote their ascent into the new hive placed over them.—(*Artemisia ludoviciana*) or SAGE of the Western plains, is almost universally spread over the arid interior of the central basin of N. America on the Upper Missouri, Columbia, Snake and Humboldt rivers, where it is often a great annoyance to travellers. It appears at the meridian of 98° W., and occupies the northern half of the plains above 35°, while the Cactaceæ prevail south of this line. Its presence is indicative of barrenness and deficiency of grass, and an alkaline soil the result of an arid climate.—MOXA (q. v.) is prepared by the Chinese from the leaves of *A. Moxa* and other species, the whole surface of whose leaves is covered with a thick down.—*A. aceticæ*, a Persian species, is said to have a strong odour of vinegar.

ARTERY (Lat. *aer* and *terō*), named from the old idea that these tubes were air-carriers. Arteries are the vessels through which the blood passes from the left side of the heart to the tissues. The structure

of an arterial tube is very complex, and a section of it may be roughly subdivided into three layers, called the coats of the artery: an external, which is elastic

Subdivisions of Arterial Wall.

- | | | | |
|-----------------|-------------|--------------|-----------|
| 1. Epithelial, | } internal. | 3. Muscular, | } middle. |
| 2. Fenestrated, | | 4. Elastic, | |
| 5. Fibrous, | } external. | 6. Areolar, | |

and distensible; a middle, which is muscular, contractile, and brittle; an internal, also brittle, smooth, and transparent, being lined with epithelium on the side washed by the blood. The tube is also enveloped in cellular tissue, termed the *sheath* of the A. When an A. is wounded by a sharp instrument, the effect varies with the direction of the cut. Thus, if longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse, the edges gape, and a nearly circular orifice allows of a profuse hemorrhage. If the A. be completely divided, its walls do not collapse, like those of a vein, but pass through certain changes provided by nature to prevent fatal bleeding. The cut orifice contracts, and also retracts into its cellular sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel; and together they stem the flow, till the cut edges of the A. have time to throw out lymph (see ADHESION), and heal as wounds of other tissues. When an A. is compressed by a ligature, the brittle inner and middle coats crack, curl inwards, and heal. See BLEEDING.

The arteries of the human body are all offsets, more or less direct, of the aorta. As each main trunk passes into a portion of the body, it divides into two principal divisions: one, which breaks up into branches for the supply of the tissues in the vicinity—the A. of *supply*; and another, which passes almost branchless to supply the parts beyond—the A. of *transmission*. These, however, anastomose (q. v.) freely, so that the distant tissues are not solely dependent for their supply on only one arterial trunk. Thus, the femoral A. divides in the groin into the profunda, or *deep* femoral, to supply the thigh, and the *superficial* femoral, to supply the leg below the knee. Again, the common carotid divides into *external* carotid, to supply the neck and head, and the *internal* carotid, to supply the brain. Although arteries have generally the same distribution or arrangement of branches, they occasionally vary, and thereby are apt to puzzle a superficial anatomist. Mr. Thomas Nunn of London, an excellent human anatomist, has lately shewn that these anomalies in arterial distribution are all governed by the law of arterial distribution just mentioned, a fact which not only simplifies the study of arterial anatomy, but assists the operative surgeon out of perplexing positions. The principal arteries will be considered under their distinctive names. The best

authority on arteries is the splendid work of R. Quain.

ARTESIAN WELLS are perpendicular borings into the ground, through which water rises, from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain, in addition to the quantity of dry sand which occupies that space, about one-third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water: such are clays, which are absolutely retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in basins (q. v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds. The explanation will be more evident by a reference to the accompanying figure, which may be considered as a diagrammatic section of the London basin. There is here a number of porous beds, *b, b*, composing the cretaceous measures, resting on the impervious gault, *aa*, and these,

Section of the London Basin.

again, are covered by the equally impervious series of the London clay, *cc*, which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the whole area of these exposed edges, sinks into the more or less porous cretaceous beds, and would, in course of time, by continued accessions, fill up the basin, were it not prevented by the clay above. By driving a bore, *d*, through this superior bed, the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.

Many such wells exist in London and its vicinity; those which form the ornamental fountains in Trafalgar Square descend into the upper chalk to a depth of 393 feet. The most famous artesian well perhaps is that of Grenelle, in the outskirts of Paris, where the water is brought from the gault

at a depth of 1798 feet. It yields 516½ gallons of water in a minute, which is raised with such a force as to be propelled 32 feet above the surface. The pressure required to effect this has been calculated to exceed 50 atmospheres at the bottom of the bore. The water has a constant temperature of 81°·7 F.

It is believed that the Chinese have been long acquainted with artesian wells. They have been in use for centuries in Austria, especially in the neighbourhood of Vienna, where they are very abundant. No knowledge existed as to their source, and consequently the boring for them was engaged in and conducted in a rude and empirical manner. An excavation was made, till a bed of clay was reached; on this a perforated mill-stone was laid, and through the hole the clay was bored until water rose. As soon as geology took the position of a science, and the theory of A. W. was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already, districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made: it seems likely that erelong Africa's deserts may thus be converted into fertile plains. In an official report of the Algerian government for 1856—1857, it is stated that Artesian borings have been executed in the Sahara of the province of Constantine with remarkable success. The first attempt, after a few weeks' labour, produced a constant stream, forming a perfect river, and yielding 4010 quarts of water per minute, at a temperature of 78° F. Several other wells have been sunk with equal success. The result is likely to be beneficial not only to the country materially, but also to the character and habits of its nomadic Arab inhabitants. Several tribes have already settled down around these wells, and forming thus the centres of settlements, have constructed villages, planted date-palms, and entirely renounced their previous wandering existence.

A. W. have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81°·7 F., while the mean temperature of the air in the cellar of the Paris Observatory is only 53°. MM. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. The latter gentleman has recently made a series of very accurate and careful observations on the temperature of two borings at Creuzot, within a mile of each other, commencing at a height of 1030 feet above the sea, and going down to a depth, the one of 2678 feet, the other about 1900 feet. The results, after every possible caution had been taken to insure correctness, gave a rise of 1° F. for every 55 feet down to a depth of 1800 feet, beyond which the rise was more rapid, being 1° for every 44 feet of descent.

ARTEVELDE, JACOB, a brewer of Ghent, celebrated as a popular leader in the 14th c. In the war between England and France, he gave his aid to the former, while the counts of Flanders supported the latter. A., after gaining great advantages over the party of the nobles, went too far when he proposed that the son of Edward III. of England should be elected Count of Flanders. For this the Flemings were not prepared, and, in consequence, A. was killed in a popular insurrection, August 19,

1345. His son Philip, in 1381, was leader of the people of Ghent in their civil war against Bruges, and gained a victory over Count Louis. The latter was afterwards assisted by Charles VI. of France, and Philip A. was defeated and slain in the battle of Rosbeke, 1382. The history of A. has been several times treated dramatically. In England, Henry Taylor, a living writer of eminence, has produced a beautiful 'closet-play,' entitled *Philip Van Artevelde*.

ARTHUR, KING of the tribe of ancient Britons called Silures, lived in the beginning of the 6th c. He rallied round him the remains of the British tribes, now driven into the west of England, and bravely defended the liberty and faith of his people against the encroaching and conquering pagan Anglo-Saxons, under Cerdic. Lancashire and the north-west seems to have been the scene of the first part of his career; afterwards it lay in the south, where he fought the battles of Iliongorth, supposed to be Portsmouth, and Badon, identified by some with Bath. In a battle with his own nephew, Modred, who had revolted, fought on the Camlan, in Cornwall, in 542, A. was mortally wounded, and being conveyed to Glastonbury, died, and was buried there (in insula Avalonia). Tradition preserved the memory of the place of his interment; and Giraldus Cambrensis relates that he was present when the tomb was opened by command of Henry II., and the bones and sword of the monarch found. Thus much may, perhaps, be received as history.

But this last struggle of the Celtic peoples before they were nationally extinguished, became the groundwork of a multitude of heroic legends, which spread from Wales and Bretagne (Armorica) over the whole Romanic and Teutonic worlds, and for centuries furnished favourite themes for the poets of the middle ages. In the lays of the Welsh bards, supposed to be as early as the 6th and 7th centuries (although no manuscript is extant of older date than the 12th c.), the national hero A. and his brave companions are celebrated. It is in the chronicles of the 9th c. (Nennius) that the legendary additions begin to develop themselves, and the magician Merlin comes into association with A. According to the romances, A.'s father, Uther, conceiving a passion for Igera, wife of Gorlois, Duke of Cornwall, was changed by Merlin into the likeness of Gorlois, and A. was the result. After his father's death, A. became paramount leader of the British, vanquished the Saxons in a number of battles, and made victorious expeditions to Scotland, Ireland, Denmark, Norway, and even to France, where he defeated a great Roman army. During his absence, his nephew, Modred, revolted, and seduced Ginevra or Guinevere, Prince A.'s wife. A. returning, fell in a battle with his nephew; but according to popular belief, he is not dead; his soul went into a raven, and he will yet reappear. His habitual residence was at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lived in splendid state, surrounded by hundreds of knights and beautiful ladies, who served as patterns of valour, breeding, and grace to all the world. Twelve knights, the bravest of the throng, formed the centre of this retinue, and sat with the king at a round table—the 'Knights of the Round Table.' From the court of King A. there also went knights to all countries in search of adventures—to protect women, chastise oppressors, liberate the enchanted, enchain giants and malicious dwarfs, was their knightly mission. The description of these adventures, the scene of many of which is laid in what is still called the Brezilian forest in Bretagne, forms the subject of the innumerable romances about A. and his knights that abounded in all the languages of the West. A Welsh collection of stories called the

Mabinogion, supposed to be of the 14th c., and lately translated into English by Lady Charlotte Guest, gives an idea of the Arthurian legends that circulated in the native land of the hero. In France, whither the subject first found its way, the 'knights of the round table' became the ideal of that splendid and courtly chivalry, which there reached its acme in the 12th c. Early in that century, the chivalric romances of France became known in Germany, and there the rather lifeless and wearisome matter of the Arthurian legends assumed a more animated and artistic form in the *Parzival* of Wolfram of Eschenbach, *Tristan and Isolde* of Gottfried of Strasburg, *Erec and Iwein* of Hartmann, and *Wigalois* of Wirnt. The most renowned of the heroes of the Arthurian school are Peredur (Parzival or Perceval), Tristan or Tristram, Iwein, Erec, Gawein, Wigalois, Wigamur, Gauriel, and Lancelot. From France, the Arthurian romances spread also to Spain, Provence, Italy, and the Netherlands, and were also retransplanted into England. It was only towards the end of the middle ages that these legends made their way through Germany to the Norse and Slavonic peoples. As early as the middle of the 12th c., Geoffrey of Monmouth (q. v.)—professing to translate from a history of Britain written in the British tongue, and found in Armorica or Brittany, but more probably himself weaving into a kind of connected history the popular tales current in Wales, of which he was a native, and in Armorica—had written the story of King Arthur in Latin prose, but without many of the embellishments it subsequently received from the Romancers. One of the publications that issued from the press of Caxton (1485), was a collection of stories by Sir Thomas Malory, either compiled by him in English, from various of the later French romances (such as *The Prophecies of Merlin*; *The Quest of the St. Graal*; *The Romance of Sir Lancelot of the Lake*; *The History of Sir Tristram*, &c.), or translated directly from an already existing French compendium. A reprint of Caxton's *Kyng Arthur*, with an introduction and Notes, by Robert Southey, was issued in 1817 (*The Byrth, Lyffe, and Actes of Kyng Arthur*; of his *Noble Knightes of the Round Table*, &c., 2 vols. 4to). The name of King A. was given during the middle ages to many places and monuments supposed to have been in some way associated with his exploits, such as 'Arthur's Seat' near Edinburgh, 'Arthur's Oven' on the Carron near Falkirk, &c. What was called the sepulchre of his queen was shewn at Meigle, in Strathmore, in the 16th c. The interest of the legends about King A. and his knights has recently been revived by the publication of Tennyson's *Idylls of the King* (1859). See Turner's *History of the Anglo-Saxons*, Appendix; Warton's *History of English Poetry*; Ritson's *King Arthur*; De la Villemarqué, *Contes Populaires des Anciens Bretons* (2 vols., Paris, 1842); Grässe, *Die Grosse Sagenkreise des Mittelalters* (Leip. 1842).

ARTHUR'S SEAT, a hill in the immediate vicinity of Edinburgh, which rises to the height of 822 feet above the level of the sea. The ascent is easy, and the prospect from the top unrivalled.

A. S. is supposed to derive its name from the British king of that name. When the hill received this appellation is not known; but as early as the close of the 15th c., Kennedy, the Scotch poet, mentions 'Arthur Sate or any hicker hill.'

The hill is formed of a mass of trap of various species, upheaved through the carboniferous strata of Central Scotland, and presenting on the west and south sides, at the height of 570 feet, a perpendicular range of precipices, called Salisbury Crags, 60 to 80 feet high. The trap is in tabular masses, and has elevated and hardened the carboniferous

sandstone, shale, and limestone beds, which dip east, and crop out on the west, besides being broken through and overflowed by the trap-rocks. In the centre of the hill, the trap often encloses fragments of sandstone, and divides it by veins. The central and upper part of the hill, and the remarkable columns called 'Samson's Ribs,' consist of basalt. To determine the density of the earth, a series of observations was made in 1855 by Lieutenant-Colonel James of the Ordnance Survey, on the attraction of A. S., or the amount of deviation from the vertical caused by its mass on the plumb-line. Calculation made the mean density of the whole earth 5.316 (water being 1), or about twice the mean specific gravity of the rocks forming the hill, which experiment gave as 2.710.

ARTICHOKE (*Cynara Scolymus*), a thistle-like perennial plant, now growing wild in the south of Europe, but probably a native of Asia. The genus *Cynara* belongs to the natural order *Compositæ*, sub-order *Cynarocephalæ*, and is distinguished by the bracts of the involucre being fleshy at the base, and emarginate, with a hard point, and the receptacle fringed. *C. Scolymus* has the radical leaves 3—4 feet

Artichoke.
(Head of flowers.)

long, somewhat spiny, some of them pinnatifid, some undivided. The stem is two or three feet high, branched, with large heads of violet-coloured (sometimes white) thistle-like flowers at the summits of the branches. The involucre is tumid, and consists of fleshy, roundish-ovate, crenate, acuminate, imbricated scales. The seeds are elongated and quadrangular, with smooth and firmly attached pappus. The plant has been long cultivated for the sake of the delicate succulent receptacles of the heads of flowers, taken before the flowers expand, which are boiled and eaten, or, on the continent of Europe, eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used in the same way as that of the Cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about four feet asunder, and two feet apart in the row. The A. bed continues productive for several years. Seaweed is an excellent manure.—The CARDUON (q. v.) belongs to the same genus.—The Jerusalem A. (q. v.) is a totally different plant.

ARTICLE (Lat. *articulus*, a joint) signifies in

general a part of a systematic whole. Thus, we speak of the several articles of a confession; the articles of war; a leading article, &c.

The use of *A.* as a grammatical term arose as follows. In such a sentence as, 'He found *that* (or *the*) man *that* he was looking for,' the Greeks considered the defining particles as connecting the two parts of the sentence, and called them joints (Gr. *arthra*, Lat. *articuli*); the name was subsequently confined to the first of the two, the other being called the relative.

In English, there are two articles—the definite *the*, and the indefinite *a* or *an*; and other modern languages have corresponding words. But articles are not essential to language. The Latin had no articles, and the Greek, as well as the older Germanic languages, the Mæso-Gothic and old Norse, e. g., had only the definite *A.* 'In no language,' says Dr Latham, 'in its oldest stage, is there ever a word giving, in its primary sense, the idea of *an* or of *the*. As tongues become modern, some word with a *similar* sense is used to express the relation. In the course of time, a change of form takes place, corresponding to the change of meaning.'

The definite articles originate uniformly in demonstrative pronouns. Eng. *the* is only a weakened form of *that* (Anglo-Saxon *that*). The same is the case with Ger. *der*; and Fr. *le*, Ital. *il* and *lo*, and Sp. *el*, are all from the Lat. *ille*, 'that.' In like manner, *an* or *a* is from the old form of *one* (ane); Ger. *ein* is both *one* and *a*; and so are Fr. *un*, Ital. and Sp. *uno*, both from Lat. *unus*=*one*.

In the Scandinavian tongues, the article is attached to the end of the word; the Danish, for example, writes *kong-en*, the king; *hus-et*, the house.

ARTICLES OF WAR are regulations made for the government of the military and naval forces of the country. They are of three classes—1. Those relating to the army, including therein the forces in India, according to the provisions of the 21 and 22 Vict. c. 106; 2. Those relating to the marine forces; and 3. Those relating to the navy.

1. *A. of W. for the Army*.—These are regulations or ordinances issued under the authority of the annual MUTINY ACT (q. v.), and which Articles that act provides shall be judicially taken notice of by all judges and in all courts whatsoever; and copies of the same printed by the Queen's printer shall, as soon as may be after the same shall have been made and established by Her Majesty, be transmitted by Her Majesty's Secretary-at-war to the judges of Her Majesty's superior courts at Westminster, Dublin, and Edinburgh respectively, and also to the governors of Her Majesty's dominions abroad; provided that no person within the United Kingdom of Great Britain and Ireland, or within the British Isles, shall by such *A. of W.* be subject to be kept in penal servitude, or to suffer any punishment extending to life or limb, except for crimes which the act expressly declares shall be so punishable. And for the enforcement of such *A. of W.*, a power is given to the crown to erect, or grant authority to convene, *courts-martial* with the jurisdiction to try and punish offences according to the Articles themselves and the provisions of the Mutiny Act. In order, however, to limit as far as possible the power conceded to the crown in this matter, it is enacted that nothing therein contained shall be construed to exempt any officer or soldier from being proceeded against by the ordinary course of law; and that where he is accused of any offence against a subject of the realm punishable by the known laws of the land, he shall be delivered over to the civil magistrate. The military offences against which these *A. of W.* are directed, relate to the soldier's duties and obligations; to crimes and

offences and their punishments; to courts-martial; and to military rank. The military crimes and offences referred to are those against divine worship, mutiny, and insubordination, desertion and absence without leave, offences in the field, camp, garrison, or quarters; drunkenness, disgraceful conduct, false returns, billets and carriages, and miscellaneous offences. By the 3d of these Articles it is ordered that every recruit shall, within ninety-six hours after recruiting, have the 40th* and 46th of the Articles read to him, and shall, within ninety-six hours, but not sooner than twenty-four hours, make the following oath before some qualified authority: '*I do make oath, That I will be faithful and bear true allegiance to her Majesty, her heirs and successors, and that I will, as in duty bound, honestly and faithfully defend her Majesty, her heirs and successors, in person, crown and dignity, against all enemies, and will observe and obey all orders of her Majesty, her heirs and successors, and of the generals and officers set over me. So help me God.*' The 160th article also deserves notice. It is to the effect, that whenever any military forces shall have embarked on board ships of war or transports, the officers and soldiers of such forces shall, from the time of embarkation on board ship, strictly conform themselves to the laws and regulations established for the government and discipline of the ship; and shall consider themselves, for these necessary purposes, under the command of the senior officer of the particular ship, as well as under the superior officer of the fleet (if any), to which such ship belongs. See *A. of W. for the Marine Forces*.

2. *A. of W. for the Marine Forces* are the regulations made under the authority of another annual Mutiny Act, which relates exclusively to the royal marine forces; but, unlike the *A. of W.* for the army, they do not issue directly from the crown, but are made by the Lord High Admiral of the navy, or by the commissioners for executing that office, and they are expressly authorised so to be made by the first section of the last-mentioned Mutiny Act. With this exception they are in themselves very much the same as the *A. of W.* for the army. They relate exclusively, however, to the marine forces *while on shore*, and this specialty is very anxiously expressed in the preamble of the act, which proceeds on the recital that 'the said forces may frequently be quartered, or be on shore, or sent to do duty, or be on board transport-ships, or merchant-ships, or vessels, or they may be under other circumstances in which they will not be subject to the laws relating to the government of her Majesty's forces by sea.' Of course, while on board, and doing duty in any of Her Majesty's ships or vessels in commission, the marines, like the other naval forces, are subject to the *A. of W.* made for the government of the navy.

3. *A. of W. for the Navy*.—In regard to such articles or regulations, the navy is differently situated. Unlike the army or the marine forces on shore, the navy is not controlled or governed by any annual Mutiny Act, but the *A. of W.* relating to it are contained in, and expressly enacted by, an old act of parliament, the 22 Geo. II. c. 33, which, with some slight alterations, still supplies the law of the sea-service. The first naval *A. of W.* authorised by parliament were those contained in the 13 Chas. II. c. 9, which was said to have been drawn up by Admiral Montague, afterwards Earl of Sandwich, with the approbation of Lord Chancellor Clarendon and other distinguished members of the privy council.

* This is evidently a mistake, for the 40th article relates to the misconduct of commissioned *chaplains*. It would appear to be more reasonable that the articles to be read to the recruit should be those relating to mutiny and insubordination, being from the 41st to the 46th inclusive.

But that statute and its subsequent supplementary acts were all repealed by the 22 Geo. II. c. 33. See Mr. Prendergast's *Law of the Navy*, 1852, Part I., p. 15.

ARTICLES, THE SIX, often mentioned in the ecclesiastical history of England in the 16th c., were articles imposed by act of parliament in 1539, when Henry VIII. being displeased with some of the bishops most favourable to the Reformation, their opponents for a time regained the ascendancy. These A. asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing them was popularly called 'the six-stringed whip.' Severe penalties were appointed for writing or speaking against them, and for abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the House of Lords: the king was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and although it continued substantially unrepealed, it was transgressed with impunity even by ecclesiastical dignitaries.

ARTICLES, THE THIRTY-NINE, of the Church of England, are the articles of religion which were agreed upon by the archbishops and bishops of both provinces and the whole clergy in the convocation held at London in the 4th year of Elizabeth, 1562, under Archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, forty-two in number, in the reign of Edward VI. The council appointed by the will of Henry VIII. to conduct the government during the king's minority, was for the most part favourably disposed towards the Reformed opinions, and the management of church affairs devolved almost entirely upon Archbishop Cranmer. In the year 1549, an act of parliament was passed, empowering the king to appoint a commission of 32 persons, to make ecclesiastical laws. Under this act, a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (amongst whom were Cranmer, Ridley, Hooper, Coverdale, Scory, Peter Martyr, Justice Hales, &c.) was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were forty-two in number, and were set forth by the king's authority in 1553. Strype and Burnet make it appear that these forty-two articles were agreed upon in the convocation that was sitting in 1552, but this was not the case. Fuller, speaking in his quaint way of this convocation, declares that it had 'no commission from the king to meddle with church business, and,' he adds, 'every convocation in itself is born deaf and dumb, so that it can neither hear nor speak concerning complaints in religion till first *Ephphatha*, "Be thou opened," be pronounced unto it by royal authority. However,' he continues, 'this barren convocation is entitled the parent of those forty-two articles which are printed with this title, *Articuli de quibus in Synodo Londinensi 1552 A. D. inter Episcopos et alios convenerat*.' To these articles was prefixed the Catechism, and there is no doubt of Cranmer having had the principal hand in their composition; for he owned before Queen Mary's commission that they were his doing. But immediately after their publication, Edward died, and one of the first acts of the convocation summoned with the parliament in the first year of Queen Mary, was to declare that these forty-two articles

had not been set forth by the agreement of that House, and that they did not agree thereto. In 1558, Elizabeth succeeded her sister. In 1559, Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed Church. Parker applied himself to this work, and for the purpose, revised the forty-two articles of King Edward, rejecting four of them entirely, and introducing four new ones, viz., the 5th, 12th, 29th, and 30th as they now stand, and altering more or less seventeen others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to thirty-nine. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to thirty-eight. From these thirty-eight there was a further omission, viz., of the first half of the 20th article, which declares that 'the church hath power to decree rites and ceremonies, and hath authority in controversies of faith.' As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571, the articles once more underwent revision. Archbishop Parker and Bishop Jewel made a few trifling alterations, and the 29th being restored, the convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe 'such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments.' There still, however, remained some difficulty as to which was the authorised copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the thirty-nine articles as they now stand. 'His Majesty's Declaration,' which precedes them, and directs that they shall be interpreted 'in their literal and grammatical sense,' was prefixed by Charles I. in 1628.

It may be interesting to know from what other sources the thirty-nine articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melancthon.

The thirty-nine articles have been described as 'containing a whole body of divinity.' This can hardly be maintained. They contain, however, what the Church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the Church of Rome, and of certain Protestant sects. As far as they go (and there are many things unnoticed by them) they are a legal definition of the doctrines of the Church of England and Ireland; though it is to the *Book*

of *Common Prayer* that members of that communion look for the genuine expression of her faith. They were adopted by the convocation of the Irish Church in 1635, and by the Scotch Episcopal Church at the close of the 18th century. Corpus Christi College, Cambridge, contains the only copies of the A. in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the A. of 1562, and the English manuscript of the A. of 1571, each with the signatures of the archbishops and bishops who subscribed them. See *An Account of the Thirty-nine A.*, by Dr. Lamb.

For other 'Articles,' see LAMBETH, PERTH, and SMALKALD.

ARTICULATA or **ARTICULATED ANIMALS**, one of the great primary divisions of the Animal Kingdom, according to the system of Cuvier, who in this is followed by recent naturalists generally. The term indicates not the possession of articulated members, but the articulated structure of the whole body. The A. are composed of segments articulated or jointed together in a line, each segment being formed of one or more rings, which in some appear externally as mere transverse folds in a soft skin, but are often covered with a hard substance similar in chemical composition to the bones of vertebrate animals. To this the muscles are attached, and it has sometimes received the name of an external skeleton—a name perhaps suggestive of closer and more numerous analogies to the bony framework of the vertebrate animals than actually exist. In some of the A. the rings are almost equally developed; in others, the difference is very great. They are divided into those which have, and those which have not articulated members; the first subdivision including Insects, Arachnida, Crustacea, and Myriapoda; the latter, Annelida and Entozoa. Some naturalists rank Cirrhopoda (Barnacles, Acorn-shells, &c.) among the A., and regard them as intermediate between these two subdivisions; others follow Cuvier in placing them among the Mollusca. The Rotifera (or wheel animalcules) are also placed by some in the second subdivision of the A., but their right to be so placed is by no means well established. It is in the first subdivision only that the rings are very distinctly grouped in what are called segments of the animal; and even in the Myriapoda (Centipedes, *Juli*, &c.) they often seem little else than mere repetitions of each other; whilst in some of the Crustacea, as the Crabs, the trunk becoming encased in a hard envelope, the segments become immovably united, so that they no longer appear as distinct. A few only of the lowest A., however, are destitute of a distinct head, in which are placed the eyes and other organs of special senses, with regard to which there is considerable difference in the different classes. In it also they usually have jaws for seizing their food and cutting or tearing it to pieces. Their jaws do not open vertically, as in vertebrate animals, but laterally; and there are frequently several pairs of them. Some, however, have the mouth adapted merely for suction. The alimentary tube often proceeds in a straight line from one extremity of the body to the other; and when it is convoluted, its convolutions are usually few. There is no proper heart; but instead of it, we find a *dorsal vessel*, a tube carried along the central line of the body near the back or upper side, and divided in a manner corresponding with the division of the body into rings and segments; a general connection being thus maintained, whilst each segment or each ring has to a certain extent a system of circulation for itself. Respiration is effected either by gills (*branchiæ*), which is the case in those A. that live in water, or by air-tubes (*tracheæ*) and sacs; and the aëration of the blood

taking place not merely in one or two, but in many of the rings, great muscular power and activity are maintained without a very active circulation. The muscular power is, indeed, greater in proportion to the size in the A. than in any other animals. The blood is usually white; in some of the Annelida alone it is red; but this colour (see **ANNELIDA**) does not indicate any approach to the higher classes of animals, although even Cuvier appears to have regarded it as a reason for assigning to the Annelida the first place among the A. The nervous system exhibits a great similarity throughout the whole of the A., and corresponds in its general plan with their system of circulation. It consists of a series of small nervous masses or *ganglia*, arranged in a chain along the central line of the body on the under side of the animal. A ganglion in the head is often termed the brain, and from it proceed the optic nerves and other nerves of the special senses; but it by no means perfectly corresponds to the brain in vertebrate animals. There is usually a ganglion for each ring. The ganglia themselves are double or composed of two halves, more or less distinctly separated; the connecting cord also is double. In those A. which have articulated limbs, the ganglia are largest in the parts of the trunk with which the limbs are connected, whilst they almost disappear from the more unimportant rings; in the Crabs, and some other tail-less or very short-tailed Crustacea, they are condensed into two masses.

The remains of the A. in the fossiliferous rocks are numerous, although often so fragmentary and imperfect that the determination of genus and species is impossible, and their complex organisation cannot be thoroughly investigated. It is evident, however, that many of them differed much from any animals now known to exist, and changes can be observed from one geologic period to another; the great Crustacean family of the Trilobites (q. v.), for example, being found only in the palæozoic rocks. Markings, which are regarded as the tracks and burrows of marine worms, appear among the earliest traces of animal life.

Nervous System of an Insect.

ARTICULATE SOUNDS. See **LETTERS**.

ARTILLERY. The various meanings given to this word render it desirable that the reader should know under what headings in the *Encyclopædia* to look for information on the subject. Sometimes A. means large cannon or ordnance of every kind; sometimes it includes the shot and shell as well as the cannon; sometimes it applies to the soldiers, officers, and men, who manage the large cannon in military battles and sieges; sometimes it designates the soldiers as well as the cannon, the *personnel* as well as the *matériel*. In the present work, the large pieces of ordnance, as a class, are described under **CANNON**; while the specialties of each kind will be found briefly noticed under such headings as **CARRONADE**, **HOWITZER**, **GUN**, **MORTAR**, **SHELL-GUN**, &c.; and in some cases under the names of the inventors, as **ARMSTRONG GUN**, **LANCASTER GUN**, &c. By this arrangement, we shall be enabled to confine the word A. to such articles as relate more especially to the *personnel* of the service—the skilled soldiers who have to deal with large pieces of ordnance in

land-warfare. It may, however, be well here to explain that the term *Equipment of A.* is applied to a combination of men, matériel, and horses, suitable for coast-defences, sieges, or the arming of fortified posts. There are several kinds of equipments of *light A.*, under the names of horse, field, rocket, mountain, and reserve; and others of *heavy A.*, for the attack and defence of coasts and fortified places. These various equipments are generally divided into smaller collections called *batteries* (q. v.), for more easy control and manœuvring. Brief explanations will be found under nearly all the names here indicated.

ARTILLERY COMPANY, HONOURABLE, is the oldest existing volunteer corps in Britain. Four military bodies—the *A. C.*, the *Sergeants-at-Arms*, the *Yeomen of the Guard*, and the *Gentlemen Pensioners*, were established as far back as the time of the Tudors; they all still exist, but under greatly altered circumstances. In 1537, Henry VIII. granted a patent to three persons, appointing them ‘Overseers of the Science of Artillery,’ for long-bows, cross-bows, and hand-guns. They were to constitute a guild or fraternity for this purpose, with power to appoint assistants and successors, to purchase lands, and to use a common seal; and their formal official name became ‘The Masters, Rulers, and Commonalty of the Fraternity or Guild of Artillery of Long-bows, Cross-bows, and Hand-guns.’ The freemen of the guild or Company were empowered to keep arms, and to exercise themselves in shooting. In 1605 a patent was granted by James I., intended chiefly to effect the preservation of the shooting and practising grounds around London, for the *A. C.* In 1633 a commission was appointed by Charles I., still further to insure this object. In 1638 the corporation of the city of London presented to the Company the plot of ground ever since called the Artillery Ground, near Moorfields, as a field for military exercise. Royal princes frequently enrolled themselves as members of the Company, usually as ‘captain-general.’ In 1719, George I. issued an order that all the commission and staff officers of the City Train-bands (a metropolitan militia) should become members of the *A. C.*, and exercise with the other members at all convenient times. The word ‘artillery’ had heretofore been considered as applying to bows and arrows as well as to firearms; but the members of the Company, like other marksmen, had almost abandoned archery, without, however, making any change in their designation. In a summons to the Company to meet for exercise on a particular day in 1682, it is said: ‘Those gentlemen that on that day handle muskets are desired to take care that their arms are clean and well fixed, and that they bring with them fine dry powder, and even match.’ The Company, like many other city guilds, has nearly outlived its original purpose. In 1780, when the ‘Lord George Gordon riots’ afflicted the metropolis, the members of the *A. C.* effectually protected the Bank of England; in 1848, when Chartist riots were apprehended, the Company was on the alert to render good service if needed; and in the spring of 1859, when an uneasy feeling prevailed in England concerning the designs of France, the members polished their arms and looked forward to eventualities; but the Company has never been engaged in actual warfare with an enemy.

The *A. C.* consists of members elected by ballot, who pay one guinea annual subscription, and supply themselves with dress, arms, and accoutrements. These payments, together with the rental received from a small amount of real property, constitute the fund out of which the expenses are defrayed. The members learn rifle-shooting as well as artillery practice; there are certain days of meeting

at Moorfields; and every summer there are certain days of drill and practice at Seaford. The Prince Consort was formerly their colonel or captain-general. The corps comprises six infantry companies, a grenadier company, a light-infantry company, a rifle company, and an artillery company. Until 1849, the members elected their own officers; but since that year the crown has appointed them. The lieutenant-colonel appoints the non-commissioned officers.

ARTILLERY CORPS. Referring to **CANNON** for a history of large pieces of ordnance, we here treat of the organisation of the artillery service.

The larger weapons, before the invention of gunpowder, were sometimes called *engines of war*, sometimes *artillery*, and were worked by strong and rough soldiers, who needed no particular apprenticeship to that art. When, however, large balls of iron came to be propelled by the irresistible force of gunpowder, a great revolution gradually took place, though garrison-guns and siege-guns were improved more rapidly than field-guns. Nevertheless, field-guns changed the whole aspect of military tactics; for it became necessary that an army should form in order of battle at a much greater distance from the enemy than in olden times. And when the cannon were made more rapidly movable, so did tactics vary. Gradually, a body of men were set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the manœuvring of heavy masses. The French were the first to make these researches; after them, the English; and still later, the Germans. During the Thirty Years’ War, an important step was taken in Germany—that of including the artillerymen, who were till then a sort of guild, as a component in the regular army. Gustavus Adolphus in Sweden, Frederick II. in Prussia, and Napoleon I. in France, all attached a very high degree of importance to the artillery as an arm of the service. After the great wars in the beginning of the present century, nearly all the states of Europe formally recognised the artillery as the third great branch of military service (next after the infantry and cavalry); indeed, some of them, including Russia and Sardinia, have shewn a tendency to elevate it to the first rank.

A. C., or artillerymen, are divided into land-artillery and marine-artillery. The land-artillery is divided into field, coast, garrison, and siege artillery. The field-artillery is subdivided into horse and foot. There are also the special appellation of reserve, light, and heavy artillery. In most European states, the artillerymen are divided into regiments, battalions, brigades, and companies; but in Britain the whole form one enormous regiment, which is expanded or contracted according to the exigencies of the service. See **ARTILLERY, ROYAL REGIMENT OF**. When military men speak of *the* field-artillery, they usually include cannon, carriages, horses, ammunition, and stores of every description, as well as the artillerymen. The distinction between heavy and light artillery depends on the size of the cannon, and the weight of the shot and shell propelled from them. For obvious reasons the construction of very large field-guns is avoided. Military men are not quite agreed as to the precise figures; but there is a general concurrence in opinion that a well appointed field-force should have two or three artillery guns to every 1000 infantry, and five or six horse-artillery guns to every 1000 cavalry. The proportion is necessarily affected by the kind of country and the amount of available transport. During the Peninsular war, Wellington had seldom more than 1 gun to every 1000 soldiers; when he entered France,

he had 3 to the 1000. Napoleon preferred 2 per 1000, with a larger supply of ammunition than had before been deemed necessary; and many foreign governments followed his example. Experienced officers in the British artillery have laid it down as a useful rule that an army of 60,000 men, comprising 50,000 infantry, 7500 cavalry, and 2500 artillery, should have 100 pieces of ordnance—viz., 30 for horse-artillery, 54 for foot-artillery, and 16 in reserve.

ARTILLERYMAN. See **ARTILLERY CORPS**; **ARTILLERY, ROYAL REGIMENT OF.**

ARTILLERY, PARK OF, is a collective name given to the whole of the guns, carriages, ammunition, and other appurtenances essential to the working of siege or field A. Besides reserve guns and carriages, there belong to it the ammunition wagons, as well for the infantry and cavalry as for the A., the implements and materials necessary for repairing and completing equipments, harness-stores, field-forges, laboratories, and (in some armies) transport and provision wagons. The *personnel* of a park of A. consists of A. officers, non-commissioned officers, and artillerymen; besides a large number of smiths, wheelwrights, saddlers, armourers, drivers, and other mechanics and labourers. Sometimes the term is applied to the place selected, as well as to the vast military stores collected there. During a siege, the park of A. is stationed out of reach of the enemy's fire, but in communication with the besiegers' trenches. If possible, its locality is chosen close to some good line of communication, either road or river. All pioneering or entrenching tools, and all hand-craft implements, are arranged in rows nearest to the field of action, with requisite spaces for the convenience of the storekeepers and workmen. Behind these are the materials for erecting batteries, making fascines and gabions, and filling sand-bags. Furthest removed from the enemy are the laboratories, in and near which shot and shell and other kinds of ammunition are stored. A large park of A. is usually divided into park-columns, for the sake of better supervision. Under some circumstances, the engineering park is distinct from the park of A., especially where these two arms of the service are so mutually independent as in the British army.

ARTILLERY, ROYAL REGIMENT OF, is the collective name for the whole of the A. belonging to the British army. Under **ARTILLERY CORPS**, the origin of similar bodies on the continent of Europe is briefly noted. There was no regular regiment or corps of A. soldiers in the English army till the time of Queen Anne, when the present Royal Regiment was formed. Since that period, from some anomaly which is not easily explained, all the additions have been made to the same regiment, instead of forming new regiments, to be combined into a division or corps. The regiment is now almost an army in itself; and to increase the anomaly, it comprises horse as well as foot. The foot-A., with medium guns, attend infantry in the battle-field; and with heavier guns, besiege and defend fortified places; while the horse-A., with lighter guns, accompany the cavalry. The mounted artillerymen were organised into a body long after those who manœuvre on foot. Though both corps form one regiment, they have distinct designations—the *Royal A.*, and the *Royal Horse-A.* Besides these two corps, the regiment is considered to include the *Rocket-A.*, the *Master Gunners*, and the *Invalid Gunners*.

The regiment has varied from 18,000 to 28,000 strong (including those placed upon the East India establishment) during the last few years; the foot being divided into *battalions* and *companies*, and the

horse into *troops*. A battalion usually comprises 8 companies. At a time when the number was 18,000, the regiment comprised 119 companies and troops, averaging somewhat over 150 men each. At other times, the companies have varied from 130 to 290 men each. The companies and battalions of foot-A. are designated by ordinal numbers, such as '6th company, 12th battalion;' the troops of horse-A. are designated by letters, such as 'D troop.' There are nominally, 5 officers for each company and troop; but some of these are usually absent on staff or brigade duties. In battles and sieges, a *brigade* of this A. usually consists of either two or three companies, attached to a division of the regular army. Each company, with its quota of guns and stores of all kinds, constitutes a *field-battery*; and each troop with its quota, constitutes a *horse-battery*. It has been proposed to abandon the terms *company* and *troop* altogether, as being properly applicable only to infantry and cavalry, and to use only the term *battery*; but this change has not yet taken place. Among the officers of the Royal A., there are no majors, ensigns, or cornets; equivalent services are rendered by officers otherwise designated. The men are chiefly classified as gunners and drivers.

The army estimates for 1869—70 will afford pretty correct information concerning the present state of the Royal A.

ROYAL FOOT-ARTILLERY.

Commissioned officers, . . .	765
Non-commissioned officers, . .	1,720
Rank and file, . . .	14,338

ROYAL HORSE-ARTILLERY.

Commissioned officers, . . .	91
Non-commissioned officers, . .	163
Rank and file, . . .	1,968
Total, . . .	19,045

Of this number, 12,880 are placed at the disposal of the East Indies, to be paid for out of Indian revenues. There were also voted 2208 horses for the foot-A., and 1418 for the horse.

The internal organisation of the Royal A., and the relation between the men and the guns which they serve, will be described under **BATTERY**; while the specialties of the several kinds of service will be found briefly noticed under **FIELD-ARTILLERY**, **HORSE-ARTILLERY**, **SEIGE-ARTILLERY**.

ARTILLERY, SCHOOLS OF. The first school for A. instruction was established by the Venetians in the beginning of the 16th c. Soon afterwards, Charles V. established similar schools at Burgos and in Sicily. The French founded a school of practical A. in 1675; and in 1679, they added to it a theoretical school at Douai. At present, France has no fewer than nine such establishments. Saxony had an A. school in 1766; but the other German states were more tardy in this work. In Prussia, the artillery and engineer schools are combined; but in most of the European states, a separation between these two arms of the science is made. In most schools of A., the officers' studies comprise mathematics, as much of physics and chemistry as is necessary to the duties of the artilleryist, field and permanent fortification, garrison-warfare, field-tactics, military history and topography, military surveying and sketching, drawing from the model, &c. The practical exercises include the serving and firing of guns and mortars, the laying out and constructing of field-batteries, and the operations of the laboratory and A. workshop.

The head-quarters for A. instruction in England

are at Woolwich. A *Royal Military Academy* was established there in 1741, to impart professional instruction to the artilleryists and engineers belonging to the royal army. The East India Company sent their A. cadets to this Academy from the year 1798 to 1810; but afterwards, they maintained a separate establishment at Addiscombe. At the present day, the students in the Academy are recruited by fair open competition. They enter between the ages of seventeen and twenty; and they remain two years, or such longer time as may fit them to pass an examination for the Royal A. or Engineers. The sons of military officers are admitted on lower terms than those of other persons. The financial control is under the Secretary of State for War; but the Commander-in-chief regulates the discipline and internal arrangements. There are about 40 professors, lecturers, masters, and instructors of various kinds. Besides this Royal Military Academy, there is at Woolwich a *Department of A. Studies*, for the instruction of junior officers of A., and for facilitating their visits to the fortifications and public works of foreign countries. There is also a *Select Committee*, whose duties are not so much educational as experimental; it is a small establishment for examining and reporting on the numerous inventions relating to artillery, brought before the War-office.* The establishment at *Shoebury Ness*, subordinate to the head-quarters of the A. at Woolwich, is intended to experiment upon ordnance, gunpowder, and projectiles, and to exercise young A. officers in some of their duties.

ARTOCARPACEÆ, a natural order of Dicotyledonous plants, of which the Bread-fruit (*Artocarpus incisa*) is the type; very nearly allied to that of *Moraceæ* (Mulberries, Figs, &c.), and, like it, by many botanists regarded as a sub-order of *Urticaceæ* (Nettles, &c.). The botanical distinction between Artocarpaceæ and Moraceæ lies chiefly in the straight embryo and large cotyledons of the former. The fruit is often a *sorosis* (a single succulent fruit formed of the aggregated germens of a whole spike of flowers), as in the case of the Bread-fruit (q. v.). There are

Bread-fruit. (*A. incisa*).

upwards of fifty known species, natives exclusively of the tropics. The milky juice of some yields *CACAO-THOË* (q. v.); and that of a few species is so bland as to be used as a substitute for milk (see *COW-TREE*). The juice of others is, however, very

poisonous, as that of *Antiaris toxicaria*, the Antjar poison, one of the poisons called Upas by the Javanese. The seeds are always wholesome; and those of the *Musanga* of the Gold Coast of Africa, and of *Brosimum alicastrum* in the West Indies, are eaten as nuts. The fibrous bark of the Bread-fruit Tree is made into cloth in the South Sea Islands, and that of other species of *Artocarpus* is capable of being used in the same way. The bark of *Antiaris* or *Lepurandra saccidora* is used in Western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted, and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack. The fibrous bark of *Cecropia peltata*, or Trumpetwood, is used for cordage in tropical America. The stem and branches are very hollow, and are used for wind-instruments. The wood of some species is valuable, as that of the *Brosimum* or *Piratinera Guianensis*, the Snakewood of Demerara.

ARTOIS was formerly a province of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of *Pas-de-Calais* (q. v.). The capital of A. was Arras. Louis IX., in 1239, made A. a county, and gave it to his brother Robert, who was succeeded by his son, Robert II., surnamed Posthumous, who died in 1302. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659 and 1678. Charles X., in his early life, and also after his abdication, was known by the title of Count d'Artois.

ARTS, DEGREES IN. The term 'Arts,' or 'Liberal Arts,' as technically applied to certain studies, came into use during the middle ages, and on the establishment of universities, the term 'Faculty of Arts' denoted those who devoted themselves to Science and Philosophy as distinguished from the faculty of Theology, and afterwards of Medicine and Law. The number of 'Arts' embraced in the full mediæval course of learning was seven: Grammar, Logic, Rhetoric (constituting the *Trivium*), Music, Arithmetic, Geometry, and Rhetoric (the *Quadrivium*). The terms Master and Doctor were originally applied synonymously to any person engaged in teaching. In process of time, the one was restricted to the liberal arts, the other to Divinity, Law, and Medicine. When regulations were established to prevent unqualified persons from teaching, and an initiatory stage of discipline was prescribed, these terms became significant of a certain rank, and of the possession of certain powers, and were called *gradus*, 'steps' or 'degrees.' The passing of the initiatory stage, said to have been first instituted by Gregory IX. (1227—41), conferred the title of *bachelor* (q. v.), and an additional course of discipline and examination was necessary to obtaining that of *master*. The title of Master of Arts originally implied the right, and even the duty of publicly teaching some of the branches included in the faculty of Arts; a custom which is still retained, to some extent, in the German universities, but has fallen into disuse in Britain and France, where the title is nearly honorary. The subject will be more fully considered under the general head of DEGREES.

ARUM, a genus of Monocotyledonous plants, belonging to the natural order *Araceæ* or *Aroidææ*. This order consists of herbaceous plants, some of which are stemless, and shrubby plants, some of which are aborescent, and some climb by aerial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The flowers are male and

* This committee has recently (in the summer of 1859) been remodelled, or rather superseded by a new organization.

female, naked, arranged upon a *spadix*, which is generally enclosed in a *spathe* (q. v.); the male flowers at the upper part of the spadix, and the female flowers at its base. The stamens are definite or indefinite in number; the anthers sessile, or nearly so, and turned outwards. The ovary is free, generally one-celled, many-seeded; the stigma sessile. The fruit is succulent, the seeds pulpy, the embryo in the axis of fleshy or mealy albumen, with a lateral cleft in which the plumule lies; the albumen, however, is wanting in some plants of the order.—As thus defined, this order contains almost 200 known species, natives chiefly of tropical countries, but some of the herbaceous kinds belong to colder climates.—The limits of the order are, however sometimes extended, so that it includes as sub-orders *Typhaceæ*, *Pistiacæ*, &c.—The genus *A.* has a convolute spathe; the spadix naked at the point. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable heat. Flowers, in general, are slightly warmer than the air around them, the heat being produced by the union of oxygen with some starch-like ingredient in the sap of the petals, or other parts of the flower; for flowers, instead of absorbing carbonic acid gas and giving off oxygen in the sunshine, like the leaves of plants, absorb oxygen and give off carbonic acid, like the lungs of animals. But flowers, in general, are only one degree, or one degree and a half, warmer than the air, whereas the flowers of some of the Arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been

Arum maculatum.

a, leaves and root; b, spathe, with base of spadix exposed; c, fruit.

found to have a heat of 121° F., while that of the air was only 66° F.—The only British species is *A. maculatum*, CUCKOW-PINT or WAKE-ROBIN, which is abundant in England and in most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, enclosing a rather short violet or brownish red spadix. It produces scarlet berries, 1—2 seeded, about the size of peas clustered upon the spadix. The root has a burning acid taste, which, however, it loses in drying or boiling. In a fresh state, it is a drastic purgative,

too violent for medicinal use; and, indeed, it, as well as the leaves, is an active poison; yet a nourishing farina is prepared from it, after the acid juice has been removed. This farina is a pure starch, and is known in England by the name of Portland Sago or Portland Arrow-root. It was formerly prepared to a considerable extent in the isle of Portland, where also the tubers (corms) themselves are eaten by the country-people. A cosmetic, called Cypress Powder, is made from them in France, and they are used in Switzerland as a substitute for soap. They contain, indeed, a quantity of *Saponine*, to which their acidity is supposed to be owing. They lose great part of their acidity in drying, and were formerly used in medicine as a stimulant in impaired digestion, a diuretic in dropsies, and an expectorant in chest complaints. The plant is extensively cultivated in India for food.—*A. Indicum* is also much cultivated in Bengal for its esculent stems and small pendulous tubers.—Acridity in the juice, and the presence of an amylaceous substance of very nutritious quality, from which the acid juice is easily separated, are characteristics of many plants of this order, particularly species of *Caladium* and *Colocasia*, much used for food in warm countries, under the names Cocco (q. v.), EDDOES, &c.—*Amorphophallus campanulatus* (*A. campanulatum*), called *OL* by the Bengalese, is very much cultivated in some parts of India for its roots (flat underground corms), which form a very important article of food; yet in a fresh state it is so acid that it is employed as an external stimulant, and is also used as an emmenagogue. Other species of *Amorphophallus* are still more powerfully stimulant.—Two large species of *Arisæma*, another genus very closely allied to *A.*, were found by Dr. Hooker to afford food to the inhabitants of the Sikkim Himalaya at an elevation of upwards of 10,000 feet. Their tuberous roots are bruised by means of wooden pestles, and thrown into small pits with water, until the commencement of acetous fermentation, when the acidity is mostly dissipated; but the process is so imperfect that cases of injury from the poisonous juice are frequent. The tubers of *Arisæma triphyllum* (*A. triphyllum* of Linnaeus), a native of the United States, and there known as Dragon-root and Indian Turnip, yield a pure white starch like that of *A. maculatum*. Their medicinal uses are also similar; they are employed as a stimulant of the secretions.—The DRAGON-PLANT, *A. Dracunculus*, a native of the south of Europe, is not uncommon in gardens in Britain, although it has a carrion-like smell, and its emanations are apt to produce headache and other disagreeable effects. It has a singular appearance—straight stalks, three feet high, curiously spotted like the belly of a snake.—The peculiar acidity of the *Araceæ* is most remarkably displayed in the DUMB CANE (q. v.).

A'RUN, a river rising in St. Leonard's Forest, in the middle of North Sussex, and after a course of 35 miles, falling into the English Channel. A canal unites it with the Wey, a feeder of the Thames.

ARUNDEL, a small town 5 miles inland from the mouth of the Arun, in a tertiary and chalk district, on the south side of the South Downs, in the S. W. of Sussex. It consists mainly of a very steep street rising from the right bank of the Arun to the summit of a hill crowned by a castle. The Arun is navigable for vessels of 150 tons up to the town. Bark and timber are the chief exports. Pop. in 1861, 2498. It returns one member to parliament. It is governed by a mayor, four aldermen, and twelve councillors. The castle, from its site, is a striking object, and was built soon after the Norman conquest. It is an oblong, including $\frac{5}{8}$ acres within its

walls. It was laid in ruins during the civil wars of Charles I., but being the baronial residence of the Dukes of Norfolk, the late duke restored it to its former Gothic magnificence. The keep, containing the dungeon, is a circular Norman tower of imposing strength, the walls being 8 or 10 feet thick.

A'RUNDEL MARBLES, part of a collection of ancient sculptures, formed about the beginning of the 17th c. by Thomas Howard, Earl of Arundel, and presented in 1667 to the university of Oxford, by his grandson, Henry Howard, afterwards Duke of Norfolk. The principal portion of it is the 'Parian Chronicle,' consisting of the fragments of an inscription in marble, supposed to have been executed in the island of Paros, about 263 B.C. In its perfect state, this inscription contained a chronological table of the principal events in Grecian history from the time of Cecrops (1582 B.C.) to the archonship of Diognetus (264 B.C.). The chronicle of the last ninety years is lost, and the extant portion of the inscription is much corroded and defaced. This curious and interesting monument, the authenticity of which has been questioned and vindicated with almost equal ingenuity and learning, was purchased for the Earl of Arundel, along with many other relics of antiquity, at Smyrna, by Mr. (afterwards Sir William) Petty. The inscription, and all the other principal sculptures in the Oxford Collection, are to be found fully illustrated in the relative publications of Selden, Prideaux, Maittaire, and Chandler, under the various titles of *Marmora Arundelliana* and *M. Oxoniensia*.

The nobleman whose name is associated with these ancient marbles is worthy of remembrance, independently of his general merits, as the first of his order in England who liberally encouraged the fine arts, and communicated the influence of his own taste and enthusiasm in their cultivation to a wide circle of imitators and successors. Among the scholars and artists on whom his liberal patronage was specially bestowed, were Francis Junius the younger (his librarian), and Oughtred the mathematician, Wenceslaus Hollar the engraver, whom he brought over to England, Vandyck and Inigo Jones, and the sculptors Stone, Le Sueur, and Fanelli. His collection of works of art, for the supply of which, from the treasures of antiquity, he engaged the services of two distinguished men of letters, Evelyn and Petty, rivalled the galleries of princes. After his death, it was unfortunately dispersed, and many of its choicest treasures were for ever lost sight of. His collection of sculpture alone, when entire, numbered 37 statues, 128 busts, and 250 inscribed marbles, besides altars, sarcophagi, fragments, and gems.

A'RUNDEL, THOMAS, Archbishop of Canterbury, in the reigns of Richard II., Henry IV., and Henry V., born in 1353, was the second son of Robert Fitz-Alan, Earl of Arundel and Warren. He was first Archdeacon of Taunton, and at the early age of twenty-one, he was, by the pope's appointment, consecrated Bishop of Ely. In 1388, he was, by the same authority, transferred to the archiepiscopal see of York. He was also for some years Lord High Chancellor of England. Having been banished the kingdom for taking a leading part in the first attempt which was made to deliver the nation from the oppression of Richard II., he was honourably received at Rome, and by Pope Boniface IX. nominated Archbishop of St. Andrews, with a promise of future preferment in England. In 1396 he was enthroned, with great pomp, as Archbishop of Canterbury. He was a bitter persecutor of the Lollards and followers of Wickliffe, and a chief instrument in procuring the horrible act for the burning of heretics (*De Heretico Comburendo*), passed in the reign of Henry IV. He

even carried his bigotry so far as to solicit from the pope a bull for digging up Wickliffe's bones, which, however, was wisely refused him. He also procured a synodal constitution, which forbade the translation of the Scriptures into the vulgar tongue. Amongst others whom he caused to be convicted of heresy, and sentenced to the flames, was Lord Cobham, one of the principal patrons of the new sect, at the commencement of the reign of Henry V. Soon after, A. was seized with an inflammation in the throat, which proved fatal. He died 20th February 1413.

ARVICOLA. See VOLE.

ARYAN RACE, A'RYAN LANGUAGES. The name Aryan (less properly, Arian) Race or Aryan Family of Nations is now generally used to designate that ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It consists of two branches, geographically separated, an eastern and a western. The western branch comprehends the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, and the Finns of Lapland (see Europe); the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of Northern Hindustan (see HINDUSTAN). The evidence on which a family relation has been established among these nations is that of language. Between Sanscrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages, i.e., Italian, French, Spanish, Portuguese, Wallachian), Celtic (once the language of great part of Europe, now confined to Wales and some parts of Ireland and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages—including English—and of the Scandinavian), and Slavonic (spoken in a variety of dialects all over European Russia and a great part of Austria), the researches of philology have within the present century established such affinities as can be accounted for only by supposing that the nations speaking them had a common origin. No one of these nations, whether existing or historical, can claim to be the parent nation of which the others are colonies. The relation among the languages mentioned is that of sisters—daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifications. By skilful interpretation of their indications, aided by the light of all other available monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point, as almost all ethnologists are agreed, to Central Asia, somewhere probably east of the

Caspian, and North of the Hindu Kush and Paropamisian Mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this centre, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black Sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanscrit writings (the Veda), the Hindustani style themselves Aryans; and the name is preserved in the classic Arian, a tribe of ancient Persia, Aria, the modern Herat, and Ariana, the name of a district comprehending the greater part of ancient Persia, and extended by some so as to embrace Bactriana. Ariana, or Airyana, is evidently an old Persian word, preserved in the modern native name of Persia, Aïran or Iran. *Arya*, in Sanscrit, signifies 'excellent,' 'honourable,' being allied probably to the Greek *aristos* (the best). Others connect it with the root *ar* (Lat. *arare*, to plough), as if to distinguish a people who were tillers (*earers*) of the earth from the purely nomadic Turanians or Turks.

The several members of this ethnological group will receive special notice each in its place. As to the hypothetical mother-nation—the primitive Aryan stock before separation, it might seem impossible to affirm anything beyond its mere existence and locality. But the ethnologist does not content himself with this. In an admirable essay on *Comparative Mythology* (Oxford Essays, 1856), Professor Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilisation is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of the family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organised family life there was superadded a state organisation with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Müller is so interesting that we take the liberty of quoting it entire. 'It should be observed,' he says, 'that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong

generally to the common heir-loom of the Aryan language. The proper appreciation of this fact in its general bearing will shew how a similar remark made by Niebuhr, with regard to Greek and Latin, requires a very different explanation from that which that great scholar, from his more restricted point of view, was able to give it. It will shew that all the Aryan nations had led a long life of peace before they separated, and that their language acquired individuality and nationality as each colony started in search of new homes—new generations forming new terms connected with the warlike and adventurous life of their onward migrations. Hence it is that not only Greek and Latin, but all Aryan languages have their peaceful words in common; and hence it is that they all differ so strangely in their warlike expressions. Thus the domestic animals are generally known by the same name in England and in India, while the wild beasts have different names, even in Greek and Latin.'

In this mainly pastoral life, the more important of the primitive arts were known and exercised: fields were tilled; grain was raised and ground into meal; food was cooked and baked; cloth was woven and sewed into garments; and the use of the metals, even of iron, was known. The numbers as far as a hundred had been named, the decimal principle being followed. The name for a thousand had not come into requisition until after the dispersion, for it differs in the different Aryan tongues.

Finally, it was among the yet undivided Aryans, while abstract language did not yet exist, while every word was a metaphor, and the setting of the sun, for example, could only be expressed by his growing old and dying, that those stories of gods, heroes, and monsters originated, which, with more or less of variety, but still with a family-likeness, formed the pagan mythology of every member of the group.

AS was the designation both of a Roman weight (called also *libra*) corresponding very nearly to an English pound (q. v.), and also of a coin made of the mixed metal *aes*, or bronze. The *As* (coin) originally no doubt weighed a (Roman) pound; but it was gradually reduced to $\frac{1}{16}$ of a pound, and even lower. It is thus difficult to assign any fixed value to the *As*. About 270 B.C., the denarius (= $8\frac{1}{2}$ d.) contained

As.

10 ases; so that the value of the *As* was then a little more than 3 farthings; when 16 ases went to the denarius, the value was about a halfpenny. It was by the *sestertius* (q. v.) that money was reckoned at Rome. The oldest form of *As* usually bore the figure of an ox, a sheep, or other domestic animal (*pecus*); from which it is usually supposed that the Latin word for money, *pecunia*, is derived.

A'SA, son of Abijah, and grandson of Rehoboam, was the third king of Judah. At the beginning of his reign, he was very young, and his character apparently undeveloped, for he allowed his grandmother, Maachah, to encourage idolatry; but on assuming the reins of government, one of his earliest acts was to remove her from all authority 'because she had made an idol in a grove' (1 Kings, xv. 13; 2 Chron. xv. 16). His zealous efforts to extirpate the vices and impieties

of the people were on the whole successful. He took away the Sodomites out of the land, and the altars of the strange gods, broke the images, and cut down the groves. For the next ten years, he devoted himself to strengthening the defences of his kingdom, and organised a magnificent army of more than half a million, which seems to have been looked upon as a menace by other monarchs, for one of these, Zerah the Cushite, took the initiative, and penetrating through *Arabia Petraea*, invaded Judah, but was defeated with immense slaughter. Before the battle commenced, Asa had invoked the aid of Jehovah; and some time after the victory, he and all his people entered into a solemn covenant 'to seek the Lord God of their fathers with all their heart and with all their soul' (2 Chron. xv. 12). Peace lasted for twenty years in the kingdom, but in the 35th year of Asa's reign, war again broke out between him and Baasha, king of Israel. He sought and obtained the aid of the Syrian monarch, Benhadad, but at the expense of 'the treasures of the house of the Lord'; and although successful against his adversary, he was indignantly upbraided and threatened by the prophet Hanani for not relying on Jehovah alone. Asa, flushed with success, threw the prophet into prison, and, it would appear, 'in his rage' oppressed some of the people at the same time—perhaps those only who sided with Hanani, for we know that at his death the nation honoured him with a splendid funeral; and the sacred historian pays the highest tribute to his memory, declaring that 'Asa's heart was perfect with the Lord all his days.' He reigned from 955 to 914 B.C.

ASA DULCIS (i. e., Sweet Asa), a drug in high repute among the ancients as an antispasmodic, deobstruent, and diuretic; also for supposed virtues of the most extraordinary kind, such as neutralising the effects of poison, curing envenomed wounds, restoring sight to the blind, youth to the age, &c. Its value was estimated by its weight in gold. The princes of Cyrene caused a figure of the plant producing it to be struck on the reverse of their coins, and it was sometimes called *Laser Cyrenaicum*. The plant is of the genus *Thapsia* (of the natural order *Umbelliferae*), either *T. Garganica*, or a nearly allied species, *T. Silphium*—perhaps the drug was produced by both. They are natives of the south of Europe and of Barbary, and appear to be very active purgatives.

ASSAFÆTIDA, or **ASSAFÆTIDA** (i. e., Fetid Asa or Asa), is a gum-resin, which has been supposed to be identical with the exuded juice of the *Silphium* of Dioscorides, so highly esteemed among the Greek physicians; but which, perhaps, was rather the *Asa dulcis*. Its name is derived from the Persian word *assa*, which means a *staff*. This drug is brought from Persia and Afghanistan, and is procured by drying the milky juice which flows from the root of the plant *Ferula* (*Narthex*) *A.*, which has been referred to the genus *Ferula* by Linnæus, and to *Narthex* by Dr. Falconer. The root of the *A.* plant is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odour, which much resembles that of garlic. *Ferula* or *Narthex* *A.* has its radical leaves tripartite, their segments bipinnatifid, and nearly two feet in length. The gum-resin is said by some to be obtained also from *Ferula Persica*, a plant which has the root-leaves very much divided, and all either tripinnate or quadripinnate. The name *ferula*, like the Persian *assa*, refers to the appearance of the stem of the plant. *Ferula Persica* has long been propagated successfully in Britain, and even brings its seeds to perfection.

A. is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and Afghanistan, and also to the north of the Hindu Kush range of mountains. About April, the root-leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. *A.* is extensively used in medicine, and possesses stimulant and antispasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, *A.* is composed of the following substances: resin, 65 parts; volatile oil, 3.6; gum, 19.44; bassorin, 11.66; various salts, .30. In many parts of the East, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

ASAPHI, St., a cathedral city, on a small hill between the rivers Clwyd and Elwy, in the north-west of Flintshire, Wales. The cathedral is a cruciform building, 178 by 68 feet, and was built in 1284 on the site of a wooden structure founded before 596. It has been enlarged and repaired since last century, and has a tower 93 feet high. It is one of the smallest of British cathedrals, and stands on the top of the hill on which the city is built. Kentigern, or St. Mungo, Bishop of Glasgow, and his disciple, St. A., are said to have founded the see of St. A. in the 6th c. The bishop, who has a revenue of £4200, is patron of 121 of the 148 benefices in the diocese. Pop. in 1861, 3592. St. A., with the Flint district of burghs, returns one member to parliament.

ASAPHUS. See **TRILOBITE**.

ASARABACCA (*A'saron Europæum*), a plant of the natural order *Aristolochiaceæ* (see *ARISTOLOCHIA*), a native of Europe, growing in woods; rare, and perhaps not truly indigenous, in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic. The use of *A.*, however, as an emetic has been much

Asarabacca (Asarum Europæum).

b, detached anther; *c*, style.

superseded by that of ipecacuanha, which is milder and safer. The powdered roots and leaves enter into the composition of cephalic snuffs, which cause

sneezing, and are employed as a counter-irritant in cases of headache, ophthalmia, toothache, &c. The plant contains a volatile oil, and a crystalline substance called *Asarine*, to which it seems to owe its active properties. The genus *Asarum* is distinguished by twelve horned stamens, distinct from each other and from the style, and by a bell-shaped three-lobed perianth. *A. Europæum* has a very short stem with two shining kidney-shaped leaves on long stalks, from the axil of which springs a single drooping greenish-brown flower.—A nearly allied species, *A. Canadense*, a native of Canada, is stimulant and diaphoretic, and is used under the name of CANADA SNAKE-ROOT, instead of *Aristolochia Serpentaria*. It is also called WILD GINGER, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.

AS'BEN, or A'IR, a country of Central Africa, situated in 15°—20° N. lat., and 6°—11° E. long. Pop. estimated at 64,000. Its territory comprises a large amount of desert, as well as considerable tracts of mountain land. The inhabitants are chiefly of Berber extraction, and generally profess the religion of Mohammed. They are of a degraded character, and given to marauding. The climate is rather healthy, and generally hot and dry. The rainy season is from August till October. The soil in many places is fertile, producing the doom palm, dates, and senna. Dr. Barth, the traveller, says of the aspect of the country: 'Rocky ground, overtopped by higher mountain masses or by detached peaks, and hollows overgrown with rich vegetation, and preserving for a longer or a shorter time the regular form of valleys, succeed each other by turns, and constitute the predominant feature of the country of Asben.' The capital is Agades (q. v.).

ASBESTUS, a mineral very closely allied to tremolite, actinolite, and hornblende, and which, along with tremolite and actinolite, is often ranked among the varieties of hornblende. It consists chiefly of silica, magnesia, lime, and oxide of iron, and is of a fine fibrous character, the fibres sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish colour. The variety called *Rock-cork* very much resembles cork, is soft and easily cut, and so light as to swim in water. *Rock-leather* and *Rock-wood* are varieties somewhat similar to rock-cork, but not so light. The finest fibrous variety with easily separable fibres is called *Amianthus* (from a Greek word signifying *unpol-lutible*, as *A.* is from a Greek word signifying *inde-structible*), because cloth made of it was cleansed by passing it through fire. This cloth was used by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body un-mixed. Amianthus has sometimes been used for the wicks of lamps, and is often employed to fill vinaigrettes, being moistened from time to time with a few drops of aromatic vinegar. The finest amianthus is found in the Tarentaise in Savoy. It is particularly abundant in Corsica. It is found also in Cornwall, at Portsoy in Scotland, and in several of the Shetland Islands. None of the varieties of *A.* are very common, but they are not unfrequent in serpentine and allied rocks in different parts of the world. Minerals which resemble *A.* in their fibrous character are sometimes called *asbestous* or *asbesti-form*, and some of them are believed to be varieties of augite rather than of hornblende.

A'SCALON, or A'SHKELON, a ruined city of Palestine, situated on the shore of the Mediterranean, 36 miles W.S.W. of Jerusalem, and 12 N. by W. of Gaza. It was in ancient times a fortified city, and the principal town of one of the five lordships of the

Philistines. Its name often occurs in the history of the people of Israel in the Old Testament, where it is represented as falling at an early period into the hands of the tribe of Judah. Herod the Great embellished it with baths, palaces, and fountains; but in the subsequent wars with the Romans, it suffered much damage. There was a celebrated temple of Derketo, the Venus of the Syrians, at *A.*, which is recorded to have been plundered by the Scythians, 630 B.C. After continuing long under the dominion of the Roman empire, the city came into the possession of the Saracens in the 7th c. In 1099 a great battle was fought on the plains of *A.*, between the Crusaders and Saracens, when the Christians gained a decisive victory. The city, however, a number of years after, was recaptured by the Moslems, and held by them as a strongly fortified place until 1153, when it was taken by the Crusaders under Baldwin III. In 1187 it was retaken by the Saracens, but afterwards (1192) fell into the hands of Richard Cœur de Lion. Subsequently, being more than once dismantled and repaired during the wars between Richard and Saladin, it was reduced to desolation by Sultan Bibars in 1270.

The ruins of this ancient city occupy an extensive semicircular eminence, sloping gently to the east, but abrupt and steep towards the sea. Part of the walls are still standing, with the remains of Gothic churches, a palace, and several edifices of more ancient date, which attract the notice of the traveller and the antiquary.

A'SCARIS, a genus of *Entozoa*, or intestinal worms, of the order *Nematodea* of Zeder, Cuvier, &c., and of the division *Stereinantha* of Owen. The ascarides have a body approaching to cylindrical, but thickest in the middle. They inhabit the intestines of animals. The species are numerous. One of the best known is *A. lumbricoides*, often called the common round worm, which occurs in the intestines of man and in some of the lower animals, as the hog, ox, horse, &c., and which often occasions severe disease, and sometimes death, particularly when it ascends from the intestines to the stomach. Its presence even in its most ordinary situation in the small intestines, is attended with unfavourable effects upon the general health; and the greater the number present—which, however, is not usually large—the greater, of course, is the injury; although when they remain in the intestines, worms of this species are less injurious and less annoying than other, and even much smaller intestinal worms. In subjects otherwise diseased, they occasionally find their way out of the intestines into the closed serous cavities of the body, and even pass through ulcerated parts of the external integument; but the mouth is formed only for suction, and is provided with no

Ascaris lumbricoides (male).

One-third of the true linear dimensions; *a* is the head of the worm.

means of boring through the healthy intestine. An immense number of remedies (anthelmintics or vermifuges) have been proposed and used in order to expel this parasite, some of which are very effectual. They do not in general kill the worms, but act by making their dwelling-place disagreeable to them (see VERMIFUGE). It is, however, remarked by Küchenmeister, in his work on Parasites, that the

treatment of cases of this description is as yet purely empirical, because, although there must be a condition of the intestinal canal which favours the thriving of worms, we are by no means certain what it is. The *A. lumbricoides* is ordinarily, in size and

The mouth of *Ascaris lumbricoides*, magnified.

Shewing the fleshy tubercles spread out, with cockscomb-like muscles interior to them, and the entrance to the intestinal canal.

appearance, pretty much like the Common Earthworm (*Lumbricus terrestris*), from which resemblance it has received its specific name, although the resemblance is rather in general form than in more essential characteristics. It has been seen fifteen inches in length. Its mouth consists of three fleshy tubercles, which can be spread out upon the intestine to form a broad circular sucker, and within which there is a small tube capable of being protruded. The alimentary canal consists of a muscular gullet and stomach, and a thin-walled intestine. Between the muscular layers of the body is produced a pale reddish oily matter, with a strong and very peculiar odour, which is gradually communicated to spirit in which the worm is preserved. The males are smaller than the females, and much more rare. The females produce eggs in great numbers; but it is uncertain if ever they are developed within the intestine in which the parent worm resides. They are certainly capable of being developed elsewhere, and probably the young enter the intestines of the animals of which they are eventually to be the parasites, after having spent a certain stage of their existence in very different circumstances: the worm in a very young state having never been found in the intestines of man or of quadrupeds, the situation of its perfect development. The inhabitants of damp valleys are believed to suffer more than others from the *A. lumbricoides*. It is said also to be particularly frequent in persons who are much accustomed to eat raw leaves and roots; and it has been supposed that the young may exist, perhaps in an encysted state, in the bodies of insects or other very small animals which are accidentally eaten along with such food, as the young tapeworm finds its way into the human intestines from its residence as a creature of very different size and form in the flesh of the sheep or the pig. The once prevalent idea of the equivocal generation of these worms is now completely abandoned.

A. vermicularis is another species usually referred to this genus, and is the only other species troublesome to mankind. It is known as the Thread-worm or Maw-worm, and is very common both in children and adults. It infests chiefly the lower part of the intestines, and particularly the rectum, great numbers being often present together, and occasioning intolerable itching, irritation, and loss of sleep, although there is not in general much serious injury to health. The same anthelmintics employed against other intestinal worms are found efficacious also in the expulsion of this; and clysters are often employed with great success. The thread-worm is white, not more than half an inch in length, the male much

less. Some recent authors of high reputation have separated this species from *A.*, and call it *Oxyuris*

Ascaris vermicularis (male).

vermicularis, but the term *Ascarides* is often employed in medical works with exclusive reference to it; and indeed this name, derived from the Greek *askarizo*, to jump or move briskly, probably owes its origin to the liveliness of motion which this species exhibits. It has been recently discovered that its nervous system is very highly developed, consisting of many ganglia, with connecting and ramifying cords.

ASCENSION, one of the comparatively few single islands on the globe, being about 800 miles to the north-west of St Helena, and almost as far to the south south-west of St Matthew. It is said to have received its name from the circumstance of its having been discovered by the Portuguese on Ascension-day. It is nearly in the middle of the South Atlantic, the lat. of its fort being $7^{\circ} 55' 55''$ S., and its long. $14^{\circ} 25' 5''$ W. *A.* is 8 miles long by 6 broad; its area being about 35 square miles. Though it was discovered as early as 1501, yet it remained uninhabited till 1815, when, in connection with Napoleon Bonaparte's detention in St Helena, the English took possession of it. Even now the population, about 400, is chiefly military. Like St Helena, it is of volcanic origin, and generally mountainous—one peak rising to a height of 2870 feet. Owing to the extreme dryness of the climate, which, however, is healthy, the surface is nearly destitute of verdure. Among indigenous productions are the tomato, castor-oil plant, and pepper; and various European vegetables are successfully cultivated. The chief exports of *A.* are turtle and birds' eggs—10,000 dozens of the latter having occasionally been collected in one week.

ASCENSION, RIGHT (Lat. *ascensio*, a rising; Ger. *gerade aufsteigung*), the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination. See ARMILLARY SPHERE. It is the arc of the equator

intercepted between the first point of Aries (q. v.), and the point at which the circle of declination passing through the star cuts the equator. Measured always from west to east, right A. on the heavens corresponds to longitude on the earth. The right A. of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right A. in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right A. is usually given, however, in time. The old term, *oblique A.*, was given to the right A. of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right A. was called the 'ascensional difference.'

ASCENSION-DAY, or HOLY THURSDAY, one of the great religious festivals of the Episcopal, and also of the Roman Catholic Church. It is held on the fortieth day after Easter, and is intended to commemorate the ascension of Christ into heaven. It is one of the six days occurring in the year for which the Church of England appoints special psalms, and the same church also particularly recommends it as a fitting day for the receiving of the communion. Ascension-day has been observed from the earliest times of the Christian Church. St. Augustine believes it to have been instituted either by the apostles themselves, or the primitive bishops succeeding them. Connected with the religious observances of this day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz., *beating the bounds, or riding the marches*, though their religious connection is apparently forgotten. See **ROGATION DAYS** and **PERAMBULATIONS**.

ASCETICISM. Among the Greeks, *askēsis* denoted the exercise and discipline practised by the athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions, or of severe virtue. In these senses it passed into the language of the early Christians. The language of St. Paul in comparing the Christians to wrestlers who had to contend with Satan, the world, and the flesh, contributed to this. But the philosophy of the time had more to do with it, which held the freeing of mind from matter to be the means of union with God; or, at least, that the refraining from all luxurious pleasure was the way to restore the soul to its original purity. To understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion, that the Absolute or All is the only real existence; and that individual phenomena, especially matter in all its shapes, are really nothing, and are to be despised and avoided, as involving the principle of separation from the Absolute. The East, accordingly, is the native soil of A. The glowing imagination of the oriental carries the practice of it to a monstrous extravagance, as is seen in the frightful self-tortures of the yogis and fakirs, the suicides in the sacred Ganges and under the wheels of Juggernaut, and the practices now or recently prevalent of offering children in sacrifice, and of burning widows; most of which, however, have been

humanely suppressed by the efforts of the British government. Buddhism, which may be considered as a kind of puritan revival or reformation—the methodism of the Indian religion—carried the principle beyond its previous bounds. In its contemning the world; in its inculcating a life of solitude and beggary, mortification of the body, and abstinence from all uncleanness and from all exciting drinks, the object was to keep as distant and detached as possible from this 'Vale of Sorrow' (see **BUDDHISM** and **NIRVANA**). The sober Chinese, and the more moral and rational Persians, never carried asceticism to these extravagances; and the earnest Egyptians sought to confine it to monogamy of the priests, abstaining from the flesh of swine and from beans, rigid purity, circumcision, moderate flagellation, and frequent contemplation of death (which there were arrangements for bringing to remembrance, even in the midst of festivities). These are certainly milder forms of A., but the principle is the same.

It is in the light of this fore-history that we must consider Judaic and Christian asceticism. In the oriental mind, especially in Egypt, circumcision, avoiding of all uncleanness, and fasting, were signs of humiliation before God; and in the Mosaic ritual they were conditions of the favor of the holy Jehovah. Voluntary vows, abstaining even from lawful food, wine, &c., were held to have a special purifying, consecrating efficacy, particularly for prophets and men of special callings. But self-castigation continued for long foreign to the sobriety of Judaism, and even hermitism came into established practice only shortly before Christ, in Palestine among the Essenes (q. v.), in Egypt among the Therapeutæ (q. v.); though doubtless Jewish A. had become more stern and gloomy since the exile in Babylon.

A. was far less congenial to the reflective nations of the West, above all to the cheerful Greeks. A Greek felt himself entitled to enjoyment as well as his gods; hence Greek religious festivals were pervaded by cheerfulness. The only exception appears to be the Eleusinian mysteries, which never took hold of the people generally, and the passing phenomenon of the Pythagorean fraternity. The attack made by the Socratic school upon the body as the prison of the soul—a view reminding one of the East—and the extravagant contempt for the elegances, and even decencies of life, professed by the later Stoics and Cynics, were no genuine fruits of the popular Greek mind; and we must also ascribe to the infusion of oriental philosophy the ascetic tendencies of Neoplatonism, in holding abstinence from flesh and from marriage as chief conditions of absorption into the divinity.

It was into the midst of these ideas that Christianity was introduced. The Jewish converts brought with them their convictions about fasting. Fasting and Nazaritic observances were thought sanctifying preparatives for great undertakings; and the inculcation of abstinence from marriage, on the ground of the expected speedy re-appearance of Christ, falls in with the same notion, namely, that the flesh, that is, the sensuous part of our nature, is the seat of sin, and must therefore, before all things, be rigorously chained. The old oriental traditions of A.; the spirituality of Christianity, pointing away from earth to heaven; opposition to the corruption of the heathen world; the distinction made between belief and knowledge, as a higher and lower stage of intelligence, leading to a corresponding distinction of a higher and lower stage of virtue: all combined to make the Christians of the first two centuries hold aloof from the world and its wisdom, and favour abstinence from marriage, more especially on the part of the clergy. This ascetic spirit began as early

as the commencement of the 2d c. to court trial in the perilous practice of men and women living together under vows of continence. We find Cyprian dissuading from the dangerous experiment, and even the authority of the church interposed to the same effect. But during the first three centuries no irrevocable vows yet bound the devotees to a life-long A. Fasting was also comparatively rare.

But the tendency to outward manifestations now began to grow stronger. The inward and spiritual life of the Christians had greatly declined; and if the previous bloody persecutions had driven individuals from human society into the deserts, the growing secularisation of the church, after Christianity became the state religion, had the same effect to a still greater degree. All this paved the way for the chief manifestation of A.—namely, monasticism (q. v.); and the church found herself compelled by the overwhelming tide of opinion within and without to recognise this form of A., and to take it under her protection and care. From the African Church, represented by Tertullian and Augustine, a spirit of gloomy and crushing supernaturalism spread deeper and deeper over the Western Church generally, intensifying the ascetic tendencies, and leading to still more marked separation from a despised world. There were not wanting healthier minds—as Jovianus, Vigilantius, and others—to raise their voices against fasting, monkery, and the outward works of A. generally; but such protests were vain, and became ever rarer.

From the 11th c., the Cathari, Waldenses, and other sects, though ascetics themselves in a way, yet assailed the external A. of the church; the classic Petrarch fought on the same side; and so did Wickliffe, Huss, and Jerome of Prague, in their premature struggles at reformation. After a preliminary skirmish by Erasmus, the struggle was decided in the reformation of the 16th c. The fundamental principle of that movement, that salvation is secured by justification through faith, and not through dead works, struck at the root of monkery and mortification in general. But the victory has not been so complete as is often assumed. The ascetic spirit often shows itself still alive under various disguises even in Protestantism. The Mennonites inculcated a rigid A.; and with the Shakers of America, celibacy is practised as a virtue. The essence of A. is to hold self-denial and suffering to be meritorious in the sight of God, in and for itself, without regarding whether it promotes in any way the good of others or the improvement of the individual's own character. In this light, many traits presented by Puritanism, Methodism, and Quakerism appear ascetic. It is not impossible that vegetarianism, total abstinence, and other recent austerities, though advocated on other grounds, recommend themselves to the feelings of many from their falling in with this deep-seated propensity to A.; which seems a relic of that dread of the malignity of the invisible and supernatural powers which haunts the human mind in an unenlightened and savage state.

Even in the Romish Church, ascetic practices have been modified in recent times; fastings are less rigorous, and the self-sacrifice of conventual life is more directed to beneficial ends. Mohammedanism has undergone the same change. In the Greek Church, monasticism had always a milder form.

ASCHAFFENBURG, the chief town on the right bank of the Maine, in the Bavarian principality of the same name (lat. 50° 1' N., long. 9° 7' E.). It is built upon an eminence, and has both a healthy and attractive situation; but the streets are narrow, irregular, and slope steeply towards the river. The castle of Johannisburg, built between 1605—1614,

by Johann Schweikhardt, Elector of Mentz, and the favourite hunting residence of many of his successors, forms a quadrangle, with towers at each corner, and overlooks the whole town. Besides the collegiate church, the military barracks, and the town-hospital, A. possesses a Roman villa, built by the late King Louis, in imitation of the Castor and Pollux edifice discovered at Pompeii. It is celebrated for its manufacture of coloured papers, besides carrying on a considerable trade in wood, building-stone, tobacco, wine, &c. Pop. 10,676, principally Catholics.

A. existed as early as the invasion of Germany by the Romans, who built a castle here. In 974, Otto I., Duke of Swabia and Bavaria, founded the collegiate church, which greatly increased the prosperity of the place. After Otto's death, it came into the possession of the archbishops of Mentz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it is the capital, it was ceded to Bavaria by Austria.

ASCHAM, ROGER, a distinguished English writer and classical scholar, was born in 1515 at Kirby Wiske, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and in 1530 entered St. John's College, Cambridge, where he took his degree of M.A. in 1536. The study of the classics, especially Greek, had recently been revived at Cambridge, and the natural bent of A. impelled him with ardour to these studies. His reputation as a classical scholar soon brought him numerous pupils; and there being at that time no Greek chair, he was appointed by the university to read lectures in the public schools. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship, in which he excelled, and archery. In defence of the latter art, he wrote, in 1544, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII., he was rewarded with an annual pension of £10, equivalent to about £100 of our present money. About the same time, he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place as master of languages to the Lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of some offence he had taken at some persons in the princess's household. That he did not lose favour at court, however, is manifest, from his having soon after been appointed secretary to Sir Richard Morysine, ambassador to the court of Charles V. He spent three years in Germany, and published an account of his observations in that country. He also made a short tour in Italy. During his absence, he had been appointed Latin secretary to Edward VI. On his return, after the death of the king, the interest of Gardiner, Bishop of Winchester, secured his appointment to the same office under Mary; his pension also was doubled. His prudence and moderation preserved him from offending by his Protestantism. After the death of Mary, Elizabeth retained him at court in the double capacity of secretary and tutor, which he discharged till his death, in 1568. His principal work, *The Schoolmaster*, a treatise on classical education, was published in 1571 by his widow. His Latin letters and poems have been frequently reprinted. The best edition of the former is that of Elstob (Oxford, 1703). To an edition of his English works, by the Rev. J. Bennet (1767), is prefixed a life by Dr. Johnson.—ASCHAM, a case for the reception of the bow, arrows, strings, and other accoutrements of the

archer, derives its name from the author of the *Toxophilus*.

ASCHERSLEBEN, a town in the circle or district of the same name, in the Prussian province of Magdeburg, lat. 51° 46' N., long., 11° 27' E. It is situated on the river Eine, is 7 miles distant from Magdeburg, and has a population of 11,500. The inhabitants are chiefly occupied in agriculture and gardening, but its trade is not very important. It has, however, considerable manufactures of woollens, linens, earthenware, &c. In the vicinity are the ruins of the old burgh of Ascania, the original seat of the House of Anhalt.

ASCIDIA, a Linnæan genus of marine mollusca, now much restricted as a genus, but the type of a family called *Asciadiæ*. The name Ascidians is also commonly employed to designate all those tunicated mollusca which form the order *Saccobranchiata* of Owen, or in which respiration is carried on by means of gill-sacs (*branchial sacs*); and these are divided into Compound and Solitary Ascidians (*Aggregata* and *Solitaria*). The ascidians, along with the other *Tunicata*, are acephalous, or destitute of a head, and are enclosed, not in a shell, but in an elastic tunic with two orifices, composed of a substance apparently identical with the cellulose of plants, consisting only of carbon and hydrogen. Within the external tunic is a muscular membrane, regarded as corresponding to the *mantle* of other mollusca, and the openings of which agree with those of the tunic. The greater part of the cavity of the mantle forms a branchial sac, the lining of which, folded in various ways, constitutes the gills (*branchiæ*); and into it currents of sea-water are continually brought by the respiratory movements, passing out through the vent or anal orifice. Multitudinous *cilia* in the mouth and branchial sac, cause by their action this continual flow of water. The motion of the cilia is apparently quite involuntary. By this flow of water, the particles of food requisite for the animal are brought in, so that the aëration of the blood and the supply of the stomach are carried on together and by the same means. The œsophagus or gullet opens from the branchial sac, which is indeed regarded as probably an expansion of the upper part of it—a dilated pharynx. Under the branchial sac is the stomach; and the alimentary canal, which is more or less tortuous, finally returns upon itself, so that the two orifices are not far separate. The liver consists of follicles produced into tubes, and communicating with the stomach by a single opening. There is a heart and a circulation of blood, with the remarkable peculiarity of alternations in its course, the circulation every now and then pausing and being reversed. The transparency of many of the ascidians permits these and other internal movements to be easily observed. The nervous system is very simple, consisting of a single ganglion, situated between the mouth and the anal orifice, and which sends out filaments to both of them, and other branches over the surface of the mantle. The mantle is capable of contracting suddenly to eject a jet of water, and along with it any

Nervous System of Ascidia.

a, mouth; b, vent; c, ganglion; d, the mantle (the external tunic being removed).

body the presence of which is disagreeable. It also contracts and ejects water, if the animal is touched, and this appears to be the only means of defence

which these creatures possess. There is no trace of eyes or of other organs of special sense.

The ascidians are found in all seas, and often constitute an important part of the food of fishes. Some of them are occasionally used as human food, as *Cynthia microcosmus* on the shores of the Mediterranean. Many of them are very small, but some attain a size of five or six inches in diameter, and when touched, eject water to a considerable height, the largest of them to about three feet. They are all fixed by the base, in their mature state, to some solid substance, as a rock or seaweed; sometimes by the

Section of Social Ascidian.

a, mouth; b, vent; c, stomach; d, intestinal canal; e, common tubular stem.

intervention of a stalk or peduncle. In some kinds (*Social Ascidians*), the peduncles of a number of individuals are connected by a tubular stem, and to some extent they have a common circulation of blood, although each has its own heart, respiratory apparatus, and digestive system; and if a ligature is drawn around the peduncle of one so as to cut it off from the common circulation, circulation takes place in it as in a solitary ascidian. In other kinds (more strictly called *Compound Ascidians*—which designation, however, is by some authors applied to those just described, whilst these are called *Aggregate Ascidians*), the tunics of many are united into a mass, and they form systems like zoophytes. The compound system sometimes bears a general resemblance to an actinia. Very frequently it forms a slimy crust upon algæ, shells, &c., or projects in globular or conical masses, 'more like a lump of inanimate matter than a being endowed with vitality'—a curious and interesting internal organization, veiled by the coarsest exterior. The individuals are sometimes connected by a gelatinous flesh, which consists of cellulose, and there is sometimes a calcareous deposition in this connecting substance as in the compound polypes. The individuals in these systems have always sprung by gemmation from one, and both the solitary and compound ascidians propagate by eggs. The young have the power of active locomotion, resemble tadpoles in form, and swim by means of a vibratile tail, which disappears when they settle, being usually detached by contraction at the base. The sexes are supposed to be distinct only in some of the ascidians. The ovaries are usually large, and the ova are carried away by the stream which Ascidian (young) passes through the animal. It is in the solitary ascidians that the highest organization is to be observed, and in which alone a distinction of sexes appears. In them, a muscular ring surrounds the mouth, and can be closed to exclude what is unfit to enter. Within this aperture there is also a fringe of tentacula, short and simple, or longer and minutely divided. In the compound ascidians, gemmation does not begin till the single animal has been fully developed; thereafter, but after

bud is produced, according to the plan upon which the compound system is constructed, and 'the procreative force of the germ-mass finally exhausts itself in the formation of male and female organs, in which that force is again mysteriously renewed under its two forms of the spermatozoon and the germinal vesicle, by the combination of which the reproductive cycle again begins its course.'

The name ASCIDIAN ZOOPHYTES (*Zoophyta Ascidioida*) has been used to designate those zoophytes or polypes which form the class *Polyzoa* of Thompson, *Brozoa* of Ehrenberg, and which in certain features of their organisation resemble the A., although in other respects they widely differ from them. The *Alecyonidium* and *Alecyonella*, already noticed in the article *Alecyonium*, belong to this class. See POLYPE and ZOOPHYTE.

ASCLEPIADA'CEÆ, or ASCLEPIA'DEÆ, a natural order of dicotyledonous or exogenous plants, mostly shrubs, often with twining stems, almost always with milky juice. The leaves are entire, and have cilia between their stalks in place of stipules. The flowers are peculiar in their structure, although symmetrical and regular. The calyx is divided into five segments, the corolla into five lobes; there are five stamens, and the stigma has five. The filaments are usually united so as to form a tube, which is generally furnished with a coronet of peculiar hood-shaped appendages; the anthers are two-celled, the pollen grains cohering in wax-like masses, which fall out of the anther cells, and become attached to glands at the angles of the stigma; there are two ovaries and two styles very close together, and often very short, with one dilated stigma common to both. The fruit consists of two follicles, or, by abortion, of one only, having numerous imbricated seeds with thin albumen, the ends of the seeds terminating in long down. There are nearly one thousand known species, chiefly

Vincetoxicum officinale.

a, root; b, fruit; c, a single seed.

natives of warm climates. Some of them are cultivated in garden and hothouses, upon account of their curious or beautiful flowers, among the most familiar of which are some of the species of *Asclepias* (q. v.) or Swallow-wort; perhaps none of them is

more highly or deservedly esteemed than *Stephanotis floribunda*, the fragrance of which equals its beauty, and which, since its introduction into British hothouses, has been sought for the bridal-garlands of the highest aristocracy. No hothouse climber is better known than *Hoya carnosa*, at each flower of which a drop of honey is always found to hang. A number of species are medicinal, as Indian *Sarsaparilla* (q. v.), (*Hæmidesmus Indicus*); Mudar (q. v.) (*Calotropis gigantea*), so highly prized in the East Indies; *Sarcostemma glaucum*, the *Ipecacuanha* of Venezuela; *Tylophora asthmatica* and *Secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is reckoned among the most valuable medicinal plants of India; *Cynanchum acutum*, which yields a purgative called Montpelier Scammony, and *Vincetoxicum officinale*, which possesses similar properties. Argel (q. v.), much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton (see ASCLEPIAS); and the stems of not a few species afford useful fibres, as those of the *Asclepias Syriaca* (see ASCLEPIAS), the Mudar (q. v.) and other species of *Calotropis*, natives of India and Persia, *Hoya viridiflora*, *Holostemma Rheedeanum*, &c. The Mudar or Yercum fibre is very highly extolled by Dr. Royle (*Fibrous Plants of India*). The bark of *Marsdenia tenacissima*, a small climbing-plant, yields a fibre called *Jetee*, of which the Rajmahal mountaineers make bowstrings, remarkable for their great elasticity, which they are supposed in some measure to owe to the presence of caoutchouc. The fibre of *M. Roylei* is used in Nepal. *Orthanthera viminea*, which grows at the base of the Himalayas, and has long leafless wandlike stems of ten feet in height, yields a fibre of remarkable length and tenacity, and which is supposed to be peculiarly suited for rope-making. The fibres of *Leptadenia Jacquemontiana* and *Periploca aphyllum* are used in Sindh for making the ropes and bands used in wells, as water does not rot them.—The milky juice of most species of A. is acrid, but in some it is bland, and they are used for food, as is the milk itself of the Kiriaghuna or Cow-plant of Ceylon (*Gynemna lactiferum*). A few species, as *Marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. The flowers of the genus *Stapelia* have a strong smell of carrion, and flies sometimes lay their eggs upon them, as it were by mistake.—No species of A. is a native of Britain.—The order is generally regarded as nearly allied to Apocynaceæ.

ASCLEPIADES, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of Cicero's life. He has been confounded with several other persons of the same name, and, in consequence, our accounts concerning him are both confused and contradictory. He seems to have wandered about considerably before he finally settled at Rome, as we read of his being at Alexandria, Parium on the Propontis, and Athens. It is not known either when he was born or when he died. A. was opposed to the principles of Hippocrates in medicine. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and 'gestation' or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration; for his leading doctrine was, that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He is said to have been very popular with the Romans on account of his pleasant and simple cures. His maxim was, that a physician ought to cure surely, swiftly, and agreeably

—a thing which, unfortunately, is not always possible. A. is also alleged to have been the first who distinguished between acute and chronic diseases, but his knowledge of anatomy was apparently very slight. The fragments of his which remain have been gathered together, corrected, and published by Gumpert, under the title *Asclepiadis Bithyni Fragmenta* (Weimar, 1798).

ASCLEPIAS, or SWALLOW-WORT, a genus of plants, the type of the natural order *Asclepiadaceæ*. The corolla is wheel-shaped and reflexed; the coronet fleshy, and each of its hooded types has a horn. The species are generally upright—seldom climbing and twining—herbaceous plants with opposite, whorled, or alternate leaves. They are mostly American. The flowers are disposed in simple umbels between the leaf-stalks.—*A. Syriaca*, Syrian or Virginian Swallow-wort, sometimes called Virginian Silk, appears to be a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. It has an unbranched stem 4—7 feet high; thick, ovate leaves, covered with a grayish down on the under side; and large, stalked, nodding umbels of many dull red flowers, which diffuse a strong and sweetish odour. The whole plant is full of an acrid white milk, which contains caoutchouc. The young shoots are eaten in North America like asparagus, as those of *A. stipitata* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fibre of its stalks, which is used for the manufacture of thread, cloth, ropes, nets, &c., in many parts of North America, and upon account of which it has been recommended for general cultivation in Europe. The fibre is said to be of very superior quality. The plant rapidly extends by its creeping roots, and readily becomes a weed, where it has been introduced.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, &c. The latter is a very ornamental garden-flower, and is called Butterfly Weed and Pleurisy Root in the United States, where it is frequent on stony and sandy grounds. *A. Curassavica* is called Wild Ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.

A'SCOLI (anciently, *Asculum Picenum*), an old episcopal city of Italy, the capital of a delegation in the States of the Church, lat. 42° 40' N., long. 13° 37' E. It is built on a hill, on the right bank of the Tronto, which forms the boundary between the Roman and Neapolitan territories. Pop. 11,000. From the Adriatic, it is distant 16 miles west; from Ancona, 53 south. Its harbour (Porto d'Ascoli) has some coasting-trade, and is defended by two forts. The town is beautifully situated, commanding a fine view of the fertile valley through which the river flows, and of the rugged Apennines, which here rise to an elevation of 7212 feet.

In ancient times, it was inhabited by the Piceni, the descendants of a colony of Sabines, who maintained their independence against the Romans until 268 B.C. Nearly two centuries after, they took a prominent part in the Social War; and on the taking of their town by Pompeius Strabo, were subjected to the severest punishments. The town was finally annexed to the Papal States by Pope Clement V. in 1426.

ASELLI, ASELLIO, or ASELLIUS, CASPAR, a celebrated Italian physician, was born at Cremona

about the year 1581. He served at first as a military surgeon, but afterwards became professor of anatomy and surgery at Padua. In 1622, while at Milan, where he was in the habit of spending a great portion of his time, he discovered the lacteal vessels. Before A.'s time, anatomists had supposed that the chyle was carried from the intestines into the liver by the mesenteric veins. Happening one day to dissect a living dog, he noticed for the first time the multitude of little vessels, which sucked up the nutritive portion of the food. At first, he took them for nerves, and did not pay particular attention to them; but on pricking one with the point of his scalpel, a white liquid spurted out, and the discovery flashed on him in a moment. He seems, however, never to have understood or described them with complete accuracy. He died at the age of 45, leaving a treatise on the subject of his discovery, which was published a year after his death. It is entitled *De Lactibus, sive Lacteis Venis, Quarto Vasorum Mesariorum Genere, Novo Invento, Dissertatio*, and has several times been reprinted.

It is curious to reflect that such men as Gaspard Hoffman and Harvey zealously combated the opinions of A. It was nearly half a century before professional men admitted that a great discovery had been made in anatomy. See LACTEALS.

ASELLUS, in Ichthyology, a generic name now disused, but by which the cod and other *Gadida* were formerly sometimes designated. It is retained in the pharmacopœias, in the name of Cod-liver Oil, *Oleum jecoris aselli*.—The same generic name is now employed, in a different department of natural history, to denote a genus of small Isopod Crustaceans, one of which, *A. aquaticus*, is common in stagnant ponds in Britain, and is sometimes called the Water Hog-louse. This genus is the type of a family *Asellidae*.

A'ES. The singular of this name in Old Norse is *As*, pl. *Aesir*; in Gothic, *Ans*; in Saxon, *Os* (*Es*). The A. are a race of gods in Northern or Scandinavian Mythology (q. v.), though not the oldest, yet the most powerful, like the Jupiter dynasty among the Greeks. They are usually considered as numbering twelve gods, and as many goddesses. The gods are—Odin, Thor, Baldur, Niord, Freyr, Tyr, Bragi, Heimdal, Widar, Wali, Uller, and Forseti; the best known of the goddesses—Frigga, Freyja, Idunna, Eira, and Saga. The worship of the A., or the Odin religion, was rooted not only among the nations of Scandinavia, but among the Germanic races generally, at least in its outlines. Besides other traces, proofs of its prevalence are to be found in a multitude of Gothic, Saxon, and Old High German proper names, many of which continue still in use, though their connection with German paganism passes unperceived: Oswald, Esmond, Oswin, Anselm, Ansgar, &c.

ASEGILL, JOHN, an eccentric English *littérateur*, born about the middle of the 17th c. He studied for the bar, and at intervals during the whole of his checkered life transacted legal business in some form or other; but having early displayed a predilection for writing political pamphlets, he soon became involved, in spite of his cleverness, in serious pecuniary difficulties. Fortunately for him, parliament had just passed an act (1699) for the resumption of forfeited estates in Ireland, and commissioners were appointed to settle claims. A bright vision flitted across the mind of the much-harassed man. He sailed for the sister isle, and found the whole country wrangling in lawsuits. His talents, and the favour of the commissioners, secured to him a lucrative practice; and he even acquired sufficient influence to obtain a seat in the Irish parliament. Some time, however, before taking possession of

his seat, A. had published a most extraordinary pamphlet, entitled *An Argument proving that, according to the Covenant of Eternal Life revealed in the Scriptures, Man may be translated hence into that Eternal Life without passing through Death, although the Humane Nature of Christ himself could not thus be translated till he had passed through Death* (1700). Much to A.'s surprise, the public flew into a rage against this absurd production; the Irish parliament voted it a blasphemous libel, and the astonished author was expelled from the House after four days. In 1705, A. returned to England, and entered the English parliament as member for Bramber, in Sussex. But the fame of his unlucky pamphlet haunted him perpetually, and at last proved a Nemesis; for the English House, resolving to be not less virtuous than the Irish one, took up the treatise, condemned it to be burnt by the common hangman, as profane and blasphemous, and expelled A. on the 18th December 1707. After this his circumstances rapidly grew worse, until at last he found something like peace in the King's Bench and the Fleet, between which two places his excursions were confined for the term of his natural life. Here he continued to practise professionally, and—for he never succeeded in overcoming this weakness—to indite innumerable pamphlets on political and theological topics. He died in November 1738.

ASH (*Fraxinus*), a genus of trees belonging to the natural order *Oleaceæ*, and distinguished by very imperfect flowers, in which the calyx is obsolete, and the corolla either wanting or 3—4-partite; the

Common Ash.

fruit is a *samara*, a seed-vessel foliaceous at the extremity. The leaves are deciduous, and are pinnate with a terminal leaflet. There are about fifty species, mostly natives of Europe and of North America.—The COMMON ASH (*F. excelsior*) grows wild in the middle and south of Europe and north of Asia. It is an undoubted native of Britain. The flowers are quite naked; the leaves have five or six pairs of leaflets. The flowers appear before the leaves in spring, and the tree is not covered with leaves until the season is far advanced, losing them again early in autumn. It is, however, a most beautiful and umbrageous tree, highly ornamental in parks; but in parks or hedgerows it is extremely injurious to the grass or crops immediately around it. It rises to the height of 100—150 feet, generally with a smooth stem. The wood is white, tough, and hard, much valued by wheel-wrights, cart-wrights, coach-makers, joiners, and turners. It is also excellent for fuel. Sometimes it becomes irregular in the disposition of the fibres, and finely veined, and is then prized by cabinet-makers. The wood of the young trees is almost as valuable as that of the old. Indeed, the value of the timber is

greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in

Common Ash.

the highest degree. The A. prefers a loamy soil, but grows in almost any, and succeeds in situations too elevated or too exposed for most other trees. It has of late been extensively planted in elevated situations in some parts of the north of Scotland, and there, in the more sheltered glens, it grows to a large size. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the *Weeping A.*, with boughs bent almost straight down to the ground; the *Curled-leaved A.*, with dark-green wrinkled or curled leaves; and the *Entire-leaved A.*, a very curious variety, with many or all of the leaves simple (not pinnated), which has been erroneously regarded by

Common Ash.

a, a branch with leaves; b, flowers; c, fruit (on a considerably larger scale than the leaves and flowers).

some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, &c.—The SMALL-LEAVED A. (*F. parvifolia*) and the LENTISK A. (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.—The AMERICANA A., or WHITE A. (*F. Americana*), is readily distinguished from the Common A. by its lighter bark and paler green leaves. The flowers have a calyx, and the leaflets are shortly stalked and entire

(those of the Common A. being sessile and serrated). It is abundant in New Brunswick and Canada, but becomes rare to the south of New Jersey. The trunk often rises more than forty feet undivided. The wood is used for the same purposes as that of the Common A.—The RED A., or BLACK A. (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The BLACK A., or WATER A. of the New England States, New Brunswick, &c. (*F. sambucifolia*), is a large tree with buds of a deep blue colour.—The BLUE A. of Ohio, Kentucky, Tennessee, &c. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranes which extend their whole length.—The GREEN A. (*F. juglandifolia*), readily recognised by the brilliant green of its young shoots, is chiefly found in the middle states; and the CAROLINA A. (*F. Caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern states. Besides these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the Common A.—In the south of Europe grows the MANNA A., or FLOWERING A. (*F. Ornus*, called *Ornus Europea* by some botanists), whose flowers have a 4-partite calyx, and four small yellowish-white petals. The tree has much resemblance to the Common A. From it the substance called MANNA (q. v.) is obtained by means of transverse incisions in the bark; but in very favourable situations, it flows spontaneously during the greatest heat of summer. Manna is chiefly collected in Calabria and Sicily. A nearly allied species, *F. rotundifolia*, a native of Greece and the Ionian Islands, yields it also in perhaps equal quantity. The Common A. is said sometimes to produce the same exudation in the same warm climates.

The MOUNTAIN A. is the ROWAN TREE (q. v.), and belongs to a different natural order. Its resemblance to the A. is chiefly in its leaves.

The A. has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an A., called Yggdrasil (q. v.). Connected, perhaps, with these traditions is the superstitious belief in A. twigs as a charm against witchcraft and magic.

ASHANTI', or ASHANTEE', a negro kingdom in Western Africa, on the north of the Gold Coast, and near the British settlement of Cape Coast Castle, in lat. 6°—8° N., and long. 0°—3° W. A. is the most powerful state of Upper Guinea. It is mountainous, well watered, and healthy, except in the lower alluvial districts. The principal rivers are the Volta and the Assinie. The population is estimated at about a million. The land is extremely fertile; covered, indeed, with wild luxuriant forms of vegetation, and producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pine-apple, and other fine fruits, with gums, dye-woods, and timber. The principal exports are gold-dust and palm-oil, together with slaves. The natives are remarkable for their skill in certain articles of manufacture; their cottons are beautiful, as also their earthenware and sword-blades. The capital is Coomassie (q. v.).

The kingdom of A. was founded between 1730 and 1740 by a barbarian conqueror, who established a kind of feudal sovereignty over the adjoining states. In their course of conquest over the Fantees, the Ashantees became involved in war with the British (1807—1826), and were finally driven from the sea-coast, and confined within their inland territory. Missionaries who have resided in A. describe the people as exceedingly sanguinary in their

disposition and in their religious ceremonies, but courageous, and characterised by a higher degree of intelligence than the tribes which surround them. Human sacrifices are said to be very common. To celebrate the funeral of a great personage, numbers of slaves are massacred. On the death of a royal person, these sacrifices were formerly great; but through the influence of the authorities at Cape Coast Castle, and that of the missionaries, they are happily on the decline. A mission to A. has been maintained by the Wesleyan Missionary Society since 1841, and with encouraging prospects of success.

A'SHBOURNE, a small town in a rich district near the left bank of the river Dove, in the west of Derbyshire. It lies on a steep south slope, with high hills on the north. It has a cruciform church, as old as the 13th c., with triplet lancet windows, which was restored in 1845 at the cost of £5000. Pop. in 1861, 3501, chiefly engaged in the cotton, lace, and iron manufacture, and in the cheese and malt trade. At A., in 1644, the parliamentary troops defeated those of Charles I.

A'SHBURTON, LORD, (ALEXANDER BARING), born in 1774, a younger son of Sir Francis Baring, Bart., was, in early life, for many years commercially engaged in the United States and the Canadas, in the service of the great London mercantile house founded by his father. On the death of the latter, in 1810, he became the head of the firm of Baring Brothers & Co., and in 1812 was elected M.P. for Taunton. He represented that place, Callington, and Thetford, on the liberal interest, till 1831, and in 1832 was returned for North Essex as a moderate Conservative. In the short administration of Sir Robert Peel (1834—1835), he was president of the Board of Trade, and Master of the Mint, and was created Baron A. by patent in April 1835. This title had been conferred, in April 1782, on the celebrated lawyer, John Dunning, who had married Alexander Baring's aunt, and it became extinct on the death of his cousin, the second Lord A., in 1823. In 1842, Lord A.'s knowledge of business, and thorough acquaintance with American institutions, customs, and modes of thought, caused him to be appointed special ambassador to the United States, to settle the north-west boundary question, and other disputes, that then threatened to involve the two countries in war. In August of the same year, he concluded the famous treaty of Washington, commonly called the A. Treaty, by which the frontier line between the state of Maine and Canada was definitively agreed to. By this treaty, seven-twelfths of the disputed ground, and the British settlement of Madawaska, were given to the United States, and only five-twelfths of the ground to Britain; but it seemed a better military frontier to England, and included heights commanding the St. Lawrence, which the award of the king of Holland, who had been chosen arbiter, had assigned to the Americans. By the 8th and 9th articles, provisions are made for putting an end to the African slave-trade; and the 10th article provides for the mutual extradition of suspected criminals. Lord A. opposed free-trade, but strongly supported the penny postage system when first proposed by Rowland Hill in 1837. He formed a valuable collection of old paintings. His death took place May 13, 1848.—His eldest son, William Bingham Baring, second Lord A. of this creation, born in 1799, and educated at Oriel College, Oxford, entered parliament in 1836, as member for Taunton, and in September 1841 was appointed Secretary to the Board of Control. In February 1845 he became Paymaster-general of the Forces, and Treasurer of the Navy. In 1855 he was

made Commander of the Legion of Honour, 'for services rendered to commerce.'

A'SHBURTON, a small town, two to three miles east of the river Dart, in the south of Devonshire. It mainly consists of two paved streets crossing each other. It has a church in the perpendicular style, with a tower 94 feet high. Pop. in 1861, 3772, but decreasing; employed in the mines, slate-quarries, and serge manufacture. The town returns one member to parliament.

A'SHBY-DE-LA-ZOU'CH, a small town near the source of the Mease, a tributary of the Trent, in the north-west of Leicestershire. Pop. in 1861, 6337, chiefly engaged in the manufacture of stockings, hats, and firebricks, and in iron-smelting works and collieries. A canal 30 miles long, without a lock, connects the town with Coventry in Warwickshire. Geologically, the district is carboniferous; and near the town, in the coal-field, there are saline springs, containing common salt in greater proportion than the sea, and also bromine. The ruins of A. Castle, once a vast and lofty pile, stand on a height on the south side of the town. Mary, Queen of Scots, was once confined in this castle. St. Helen's Church, an ancient structure with a tower, is the burying-place of the Hastings family, as well as of Selina, Countess of Huntingdon, the founder of the sect called the Countess of Huntingdon's Connection.

A'SILDOD. See **AZOTUS**.

ASHES, the remains of animal and vegetable bodies after burning. It is not strictly correct to speak of the ashes of a mineral. When lead, for instance, is exposed to heat, it turns to dross, which has the appearance of A., but is merely the lead combined with oxygen. In the same way, volcanic A., as they are called, are only a finer kind of pumice-stone, the solidified scum of molten lava. The ashes of organic substances destroyed by fire consist of the fixed salts contained in these substances. In land-plants, the most important are salts of potash, along with silica and lime; in sea-plants, soda takes the place of potash. By lixiviation of the A., the potash or soda is dissolved and separated from the insoluble mass, and is then purified by crystallisation. The A. of sea-plants contain also more or less iodine. Peat and turf ashes contain, besides alkalies, more or less clay and sand; the same is true of pit-coal, which sometimes contains iron.

At one time, the A. or inorganic ingredients of plants were considered unessential to their existence. But the progress of vegetable chemistry has taught that a certain proportion of saline food is absolutely necessary to the development of plants. The analysis of the A. of the different kinds of vegetable substances has since become of great interest.

The A. of animal bodies do not differ greatly from those of vegetables. Bone-A. consist essentially of lime united with phosphoric acid. This bone-earth is very valuable as manure for grain. In well-wooded countries, A. from burnt wood form an article of considerable trade. They are much used in the arts, as soap-boiling, bleaching, dyeing, glass-making, &c. Wood-A. are also used in washing and other domestic processes, as a cheap preparation of potash (q. v.).

The covering of the head with A. has long been a common sign of mourning among eastern nations, indicative of the very deepest distress. Instances of this are mentioned in Scripture. Penitents in the early Christian Church signified their sorrow and humiliation in like manner, by standing at the door of the church in 'sackcloth and ashes.' See **ASH-WEDNESDAY**.

ASHFORD, a small town on the west of the

confluence of the two upper branches of the river Stour, near the middle of Kent. Pop. in 1851, 4092, which has largely increased from its having become the junction station of three great lines of railway. Damask is manufactured here.

A'SHLAR, or **A'SHLER**, building-stone squared and hewn, as distinguished from rubble, or rough stones which are used as they come from the quarry without being dressed. A. is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone

Ashlar.

which is to form the facing of the wall. Thus, there are *tooled* A.—the marks of the tooling being either *random* or in *grooves*; *polished* A., in which the face of the stone is rubbed smooth; and *rustic* A., in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term A. to squared stones before being hewn. In old documents, the term appears under a variety of forms, such as *achlere*, *ashelar*, *aslure*, and *estlar*.

ASHLEY, LORD. See **SHAFTESBURY**.

ASHMOLE, ELIAS, a celebrated antiquary, was born at Lichfield on the 23d May, 1617. In 1633, when only sixteen years of age, he commenced the study of law, and five years after, he was admitted to practice as a solicitor in Chancery. During the civil wars, he embraced the side of the Royalists, and was appointed captain in Lord Ashley's regiment, and comptroller of the Ordnance; but at the same time exhibited his love of study by joining Brazenose College, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, and astrology. In 1646, he became acquainted with several famous astrologers; amongst others, William Lilly, whose conversation had a great charm for him; and in 1650, he published a work of Dr. Dee's, to which he subjoined a treatise of his own. Continuing with singular perseverance his researches in this dim region of superstitious philosophy, he was enabled, in the course of two or three years, to issue his *Theatrum Chymicum Britannicum*, which procured for him a high reputation, and the friendship even of men like John Selden. In 1658, appeared his *Way to Bliss*, a work on the philosopher's stone—the last he published in connection with astrology. At the restoration of King Charles various honours and emoluments were conferred upon him. In 1682, he presented to the university of Oxford a very fine collection of rarities, which properly, however, belonged to certain persons of the name of Tradescant. In this transaction he exhibited a rather mean ambition to exclude the rightful owners of the cabinet of curiosities from participating in the honour of the gift, and posterity has unfortunately gratified his wish by calling it the Ashmolean Museum. He died May 18, 1692, leaving behind him a large quantity of manuscript, a considerable portion of which has since been published.

ASHMUN, JEHUDI, an American philanthropist, was born at Champlain, in the state of New York, in 1794. He was educated with a view to the Christian ministry; but eventually became editor,

in Washington, of a monthly magazine called *The Repository*. In this periodical he advocated the views of the African Colonisation Society for founding a colony of liberated negroes on the west coast of Africa. In 1821 he published a life of the Rev. Samuel Bacon, who had fallen a victim to an unsuccessful attempt to realise these views in the previous year. Learning the difficulties which surrounded a second attempt at planting a settlement in Africa, A. resolved to devote himself to the good work. Receiving an appointment as one of the agents of the African Colonisation Society, he conducted a body of liberated negroes from Baltimore, and landed at Cape Mesurado, the seat of the infant colony, in the autumn of 1822. Dr. Ayres and the other agents of the Society having meanwhile abandoned the settlement from severe illness, he assumed the superintendence of affairs as the sole representative of that body. Here, for more than six years, he devoted his powers and his life to the establishing, on a fair and solid basis, this colony, so full of hope for the American negro. He showed great courage and tact in opposing the united forces of the natives at the outset of his management, and no less ability in after negotiations with the chiefs, by which the colony acquired very considerable accessions to its territory. His health at length becoming sadly impaired, he bade adieu to the settlement, then recently called Liberia, in March 1828, and landed at Newhaven, Connecticut, in a state of great exhaustion. After a brief revival, he relapsed, and died on the 28th August 1828, in his thirty-fifth year. His remains were honoured with a public funeral. A memoir of his life, by R. R. Gurley, appeared at Washington in 1835.

ASHTAROTH. See ASTARTE.

ASHTON-IN-MAKERFIELD, a small town in a carboniferous district, in the middle of South Lancashire. Pop. in 1861, 6566, chiefly engaged in collieries, and in the cotton manufacture.

ASHTON-UNDER-LINE, a town in the south-east of Lancashire. Pop. in 1861, 66,891. It returns one member to parliament. It is a great seat of the cotton manufacture. The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, &c. To the west of the town is a large moss or shaking bog, containing fir-trees full of turpentine, and black oak, with a loamy bottom at the depth of 10 feet.

ASH-WEDNESDAY, the first day of Lent (q. v.), so called from the Roman Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590—604), was sanctioned by Pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes were consecrated on the altar, sprinkled with holy water, and signed three times with the cross, while the priest recited the words, *Memento quod cinis es, et in cinerem reverteris!* ('Remember that thou art dust, and must return to dust!') Next, they were strewed on the heads of the officiating priests, the clergy, and the assembled people. The ashes were said to be those of the palms consecrated on the preceding Palm Sunday (q. v.)—The Protestant Church in Germany does not celebrate A. In the Church of England, it is observed by the stricter members, but without anything of the ceremony from which it derives its name; and the *communion*—a series of denunciations against impenitent offenders—is appointed to be read in the service for this day.

ASIA, the largest division of land on the globe, generally regarded as the birth-place of the human race, and the most ancient seat of civilisation. Its

superficial area, including islands, has been estimated at from 16 to 20,000,000 square miles, and its population at 650,000,000. This enormous mass of continent lies almost entirely in the northern division of the eastern hemisphere, while its world of islands extends across the equator on the south-east. On three sides it is surrounded by the ocean; but on the west, is partially connected with Africa and Europe. The continental mass is more than four times as large as Europe. Some idea may be formed of its vast extent by the calculation that, though it contains more than half of the whole population of the globe, the number of its inhabitants is so small compared with its area, that Europe may be said to be three times more densely populated. The coastline is about 33,000 miles in length; and on the south and east, is diversified by seas, bays, and gulfs, affording advantages to navigation and commerce far superior to those of Africa, but inferior to those possessed by Europe and America. On the west side, the Dardanelles and the Sea of Marmora may be regarded as but a slight interruption of the great table-lands of Europe and A., which form the continent of the old world.

Horizontal Configuration.—A. is bounded N., by the Arctic Ocean; E., by the Pacific Ocean; S., by the Indian Ocean; and on the W., by Europe, the Black Sea, Archipelago, Mediterranean, and the Red Sea. On the extreme north-east, the peninsular land of Kamtschatka is separated from North America only by the narrow Behring's Strait. On the south-east, a bridge of numerous islands—Sumatra, Java, Borneo, Papua, &c.—extends towards Australia. The body of the continent may be regarded as a trapezium, of which the offsets, consisting of several large peninsulas, bear some resemblance to those of Europe; though in A. everything is on a more gigantic scale. Thus, one of these offsets, the peninsula of Arabia, is four times as large as France. On the west extends the peninsula of A. Minor, or Anatolia, divided from Europe by the Strait of Constantinople, the Sea of Marmora, and the Dardanelles, with the Black Sea on the north, and the Levant on the south. On the south of A., the peninsular configuration may be divided into three principal masses, corresponding to the southern coast of Europe; Arabia may be considered as a counterpart to Spain; Italy, with its neighbour-land, Sicily, is represented by Hindustan and Ceylon; and, as in Europe, the broken Grecian peninsula is connected with A. by a bridge of numerous islands extending on the south-east, so, in A., the Eastern Peninsula (or India beyond the Ganges), lying between the Bay of Bengal and the Chinese Sea, is connected with Australia on the south-east by the vast Eastern Archipelago. This world of islands is divided into the several groups of the Philippine Islands, Borneo, Celebes, Molucca Islands, Sumatra and Java, Timor and the numerous adjoining isles. The east coast of A. is characterised by the deep indentations of the Pacific Ocean in the Chinese Sea, Yellow Sea, and Seas of Japan, Okhotsk, and Kamtschatka; all fringed with numerous islands, and separated by the peninsula of Corea, the island of Saghalien, and the peninsula of Kamtschatka. On the north, the Siberian coasts are also deeply indented; but rather by the embouchures of large rivers than by arms of the sea. The whole length of continental A., from the Dardanelles to the Japan Islands, is 6000 miles; its breadth, from Malacca to the north-east cape of Siberia, is 5300 miles; with its islands it extends from 10° S. lat. to 78° N., and from 26° E. long. to 190° E. or 170° W. Such an extent of surface must include all varieties of soil, climate, and production.

ARCTIC

Vertical Configuration.—Equally grand are the features of this continent when regarded vertically: it has the most extensive lowlands, the most immense table-lands, the highest chains of mountains, and the most elevated summits in the world; tracts doomed to everlasting snow or scorching sterility, salubrious valleys of continual verdure, and noisome jungles of the rankest growth. The table-lands of Asia occupy two-fifths of the whole continent. The eastern extremity is 2000 miles broad; the western, less than 1000. The whole mass may be regarded as consisting of two parts, separated, or, to speak more properly, perhaps, connected by the lofty, snow-covered mountain-isthmus of the Hindu Kush. These great divisions are styled respectively: 1. The Eastern Plateau, including the Table-land of Tibet and the Desert of Gobi; 2. The Western Plateau, or Table-land of Iran. The former, a vast four-sided mass, considerably larger than the whole area of Europe, extends 2800 miles from the mountain chain, Hindu Kush, to the Tonquin Gulf in China. On the south, the plateau is divided from the plains of Hindustan by the Himalaya Mountains, which have a mean height of 18,000 feet, while several of their summits rise from 25,000 to 29,000 feet above the level of the sea. Even the passes over this enormous range of mountains are almost as high as the summit of Mont Blanc. Here Dhwalagiri, long supposed to be the Mont Blanc of the Himalayas, and with precisely the same signification, viz., 'white mountain,' rising to 27,600 feet, leaves all the peaks of the Andes far below; while Kinchinjunga reaches to 28,178 feet, and Deodunga, now believed to be the loftiest summit in the world, attains the height of 29,002 feet. Cultivation is found at 10,000 feet above the sea; while flocks graze some 4000 feet higher. In Chinese-Tatary and Tibet, the ground is cultivated at a height only 2000 feet lower than the summit of Mont Blanc. On the east, the table-land of Tibet is bounded by the Chinese mountain-ranges Yun-ling and Khing-khan, which, towards the south, are connected with wild Chinese alpine regions of which little is known; while, towards the north, they extend into another mountainous region, where the eastern chain of Shangpe-shan opposes to the Pacific Ocean a wall of rock 3000 feet high. On the north, the chain of the Altaï Mountains, 3000 miles long, and divided into several groups, forms the boundary between the great plateau and the plain of Siberia, which is larger than the whole area of Europe.

The Western Plateau, or Table-land of Iran, rises generally about 5000 feet above the sea; but in some parts to 7000 feet; descending again, however, in the central and southern parts, where it spreads out into sandy and gravelly plains, to 2000 and 1200 feet. It has been divided into three sections: the Plateau of Iran proper; the Median-Armenian Alpine region; and the Anatolian Table-land. The first division, or the Plateau of Iran, has a mean altitude of about 5000 feet. Salt plains, with gravel and sand, form large portions of the surface, and mountain-walls on all sides hem it in. On the northern edge ascend the Persian mountains; on the east, the steep and lofty parallel chains of the Indo-Persian boundary mountains; and on the south, the plateau, for 1000 miles along the Persian Gulf and Arabian Sea, is bounded by the wild terraced regions of Beloochistan and Farsistan. The second division, or the Median-Armenian Alpine region, includes the mountainous regions of Armenia, Kurdistan, and Azerbijan. Here the table-land is compressed to about half its general width. From this plateau, of which a part is mentioned in Scripture as 'the mountains of Ararat,' rises the volcanic cone commonly styled Mount Ararat, to the height of 17,212 feet above

the sea-level. Anatolia, the third and most westerly division of the table-land, is bounded along the shores of the Black Sea by mountains rising to 6000 or 7000 feet, and partly covered with forests; on the south-west, the Taurus chain of mountains, beginning in the islands of Rhodes, Cos, &c., extends in several ramifications through a part of Asia Minor, runs in a single range along the coast of Karamania, and in the east has an occasional height of 12,000 and 13,000 feet.

The Western Plateau thus divided into three sections, is full of diversities of soil and scenery. A great part of the table-land of Iran (or Persia) is extremely barren and arid, which serves to explain the enthusiastic terms in which the Persian poets have spoken of the beautiful valleys found here and there among the mountains. The coasts of the Persian Gulf are sandy wastes. Between Irak and Khorassan, a desert of clay, covered with salt and nitre, varied only by patches of verdure here and there, occupies 27,000 square miles, and joins the wide sandy desert of Kerman. A great part of Beloochistan is an arid plain, covered with red sand.

Besides these central masses, there are several detached mountain chains and plateaus. The Ural Mountains, forming the land-boundary between Europe and Asia, and separated from the Altaï chain by salt lakes, marshes, and deserts, is divided into three sections: the Northern, Central, and Southern Ural. The second of these divisions is rich in minerals—gold, platina, magnetic iron, and copper. On the isthmus between the Black Sea and the Caspian, the alpine ridges of the Caucasus reach a height of from 10,000 to 11,000 feet, while individual peaks tower up to the gigantic height of 17,000 or 18,000 feet, as, for instance, the still faintly volcanic peak of Ellerus, the exact elevation of which is 18,493 feet, and Mount Kasbeck, 16,523 feet. The high lands of Syria rise gradually from the neighbouring deserts to the height of 10,000 feet in Libanus and Anti-libanus, and slope steeply in terraces down to the narrow coast-lands of Phœnicia and Palestine. The plateau of the Deccan, in India, rises to an average height of from 1500 to 2000 feet, and is divided on the west from the narrow coast-level of Malabar by the Western Ghauts, 4700 feet; on the east, from the broad level coast of Coromandel, by the Eastern Ghauts. On the north, it is divided from the low plains of Hindustan by the Vindhya and Malwah mountain-chains; and, on the south, the Ghauts unite at the sources of the Cavery, and form the Neilgherry (or Blue Mountains, 8760 feet high), the loftiest in the peninsular portion of Hindustan. These slope steeply down to a low narrow plain, then rise again to a considerable height in the Aligherry range, sink into the sea at Cape Comorin, and reappear in the group of Adam's Peak in Ceylon. The Malayan Mountains, or chains of the Eastern Peninsula, may be regarded as offsets of the Siue-shan, and extend to the extreme south point of A., reappearing with volcanic peaks in the Sunda Islands.

The six great Lowlands of A. are, 1st, the Siberian lowland in the north, which is by far the largest. It stretches from the northern declivities of the Altaï and Ural Mountains to the shores of the Arctic Sea, and is, for the most part, cold, gloomy, and barren. 2d, The Ducharian lowland, or the wild sterile waste between the Caspian Sea and Lake Aral, much of it beneath the level of the sea. It is composed to a large extent of gravelly soil. 3d, The Syrian and Arabian lowland, the south of which is hot and arid, with almost no oases; but the north is watered by the Tigris and Euphrates. 4th, The lowlands of

Hindustan, comprising the great Indian desert, 400 miles broad, together with the vast and fertile plains of Bengal, generally called the Valley of the Ganges, and ranking, perhaps, next to China as a region of fertility. 5th, The *Indo-Chinese* lowlands, comprising the long levels of the Burman empire, through which flows the Irrawaddy, and the rich regions of Cambodia and Siam. 6th, The *Chinese* lowlands, commencing in the east at Pekin, and extending as far south as the Tropic of Cancer, containing 210,000 square miles, or an area seven times the size of Lombardy. It is watered by a copious river-system and numerous canals, and may be regarded as a vast garden, exceeding in productiveness all other parts of the world.

Hydrography.—The hydrography of A. displays as striking a variety as the structure of its land. The alpine regions send down in some directions torrents of water, which form rivers almost rivalling in magnificence those of America, and which flow for hundreds of miles through plains of unsurpassed fertility. On the other hand, there are wide stretching tracts, like the deserts of Africa, destitute of water, and doomed to eternal sterility. Only one considerable sheet of water, Lake Hamoon (q. v.), refreshes the high table-land of Iran. The low steppe of Turan contains the Caspian Sea (q. v.), the largest of all lakes, and Lake Aral (q. v.). In the valley of Cashmere lies Lake Ular, 40 miles in circumference, and the only considerable sheet of water in the Himalaya chain. At the northern base of this mountain-chain, Lake Palte is remarkable for its annular form. In Tibet and the Altai Mountains, lakes are very numerous.

One of the most striking characteristics of Asian river-systems is found in its double rivers, or two streams rising in the same region, flowing in almost parallel directions, and either uniting, or nearly so, before entering the sea. Among these twin rivers may be mentioned—the Sihon and Gihon, flowing into Lake Aral; the Euphrates and Tigris, in Western A., surrounding the plain of Mesopotamia, uniting at Koona, and together flowing into the Persian Gulf; the Ganges and Brahmaputra; and the Yang-tze-kiang and Hoang-ho, in China, rising near each other, then widely separated in their courses, but again approaching each other, and both falling into the Yellow Sea, only 100 miles apart.

The six great river-systems of A., comprising rivers which will be found fully noticed under their respective names, are—the Mesopotamian, that of North-west India, that of North-east India and Tibet, the Indo-Chinese, the Chinese, and the Siberian. The *first* comprises the two famous streams, the Tigris and Euphrates. The *second* comprises the Indus with its tributaries. The *third* system comprises the Brahmaputra and Ganges. The *fourth* system comprises the rivers of the Indo-Chinese peninsula; the chief of which are the Irrawaddy, the Martaban or Saluen, the Me-nam, the Me-king or Cambodia. The *fifth* system is the Chinese. It comprises four great streams, all of which flow in an eastern or north-eastern direction into the Pacific: the Hong-kiang, or Canton River; the Yang-tze-kiang (or Son of the Sea); the Hoang-ho, or Yellow River; and the Amur. The *sixth* system comprises the large rivers of Siberia, the principal of which are the Obi, the Yenisei, and the Lena. They all have their sources in the Altai Mountains; flow north, or nearly so; and for 800 or 900 miles before their embouchure, traverse a dreary, flat, monotonous waste, until their sluggish waters creep into the Frozen Sea.

Geology.—The geological structure of Asia is so complex, the different formations are so broken up and scattered, that a general description would be unintelligible. We must refer to separate notices,

where the geological structure and phenomena of circumscribed districts will be given in detail, and the reader will, in this way, be enabled to form a correct impression of the geology of Asia as a whole. See HIMALAYA, HINDUSTAN, CHINA, SIBERIA, &c.

Natural History.—The vast extent of A., and its great diversities of climate, naturally lead us to expect in it a great variety of natural productions, both animal and vegetable. This expectation is heightened when we consider how completely this vast continent is divided into separate portions by mountain ranges of great altitude, and how extensive the mountainous tracts themselves are, as well as the great extent of the elevated plateaus or tablelands, and when we add to these considerations that of the peculiar character of wide regions—wastes of sand—level steppes—and extensive districts of which the soil is strongly impregnated with salt. Accordingly, we find, both in the flora and fauna of Asia, all the variety which such considerations might lead us to expect.

The most northerly part of the continent, however, differs comparatively little in its productions from the corresponding parts of Europe and America. It exhibits the same arctic flora, with differences comparatively inconsiderable. Pines, birches, and willows form, as in the other continents, the last forests of the north; but upon account of the more severe climate, they do not reach a limit so northerly as in Europe, and particularly in the west of Europe. Some of the common plants of Europe are abundant as far east as Kamtschatka: the Crowberry (*Empetrum nigrum*), so plentiful in the moors of Scotland, is still more plentiful throughout Siberia; the same *Vaccinia* (Bilberries, &c.) and *Rubi* (Brambles, &c.) abound in the Kamtschatkan forests as in those of Scandinavia. There are, however, interesting differences. Heaths are comparatively rare in Asia, its flora agreeing in this respect with that of America, rather than with that of Europe. The larch, which in Europe occurs only on the central mountains, extends far northward at the mouth of the Obi to the utmost limits of arborescent vegetation; probably a mere variety of the same species, although it has been described as distinct. In Kamtschatka, a different kind of birch replaces the common birch of Europe as a forest tree, and the Siberian stone pine is different from that of the south of Europe. Siberia in its less frigid regions produces a luxuriant vegetation, of which herbaceous plants of unusually large size for a cold or temperate climate are a characteristic feature; as species of Rhubarb, Angelica, and Cow-parsnip (*Heracleum*), some of which are now well known in Britain. It is indeed from the central and eastern temperate parts of Asia that the cultivated species of rhubarb are derived, and from the same region the rhubarb root, so valuable in medicine, is brought. In the abundance of *Grossulariaceæ* (Currants), the warmer parts of Siberia resemble North America, although most of the species are different.

To the south of the Altai Mountains, the flora of Asia corresponds in part with that of the great eastern plain of Europe; but it exhibits also peculiarities which may in some measure be ascribed to the saline character of large districts, the stony or sandy desolation of others, and the elevation of the great central plateau. The flora of Asia Minor and of Syria has a general resemblance to that of the south of Europe, although exhibiting also features which belong rather to that of India or of Africa. Shrubby *Labiata* are particularly characteristic of this region, from which not a few of them have found their way into the gardens of Europe and of other parts of the world, upon account of their fragrance, their medicinal qualities, or their use for

the grateful seasoning of food.—The tropical flora of Arabia abounds in trees which yield fragrant balsams and resins, particularly of the natural order *Anguridaceæ*. Indeed, both the warmer temperate and the tropical regions of Asia excel other parts of the world in the number and variety of the odoriferous drugs which they produce, with odors of the most various characters, from myrrh and frankincense to asafetida. Arabia has long been noted for the production of coffee, which is now also pretty extensively cultivated in other warm parts of A. The date-palm is as characteristic of Arabia as it is of Egypt. Acacias and mimosas also abound.—The flora of Persia in part resembles that of Arabia, although it is less tropical, and the altitude of its mountains gives to it in some places an extremely different character.—The abundance of *Scitaminæ* is regarded as particularly characteristic of India; and plants of this order yield ginger, galangal, cardamoms, turmeric, and other articles of commerce, amongst which not the least important is a kind of arrow-root. Its *Leguminosæ* are also very numerous, both herbaceous and shrubby, or arborescent, many of them exhibiting great beauty of foliage and splendour of flowers; some producing useful kinds of pulse; others timber, gum, medicines, &c. The number of valuable medicinal plants which belong to the Indian flora is very great, as is also that of dyewoods; and it abounds in fine fruits, of which the mango and mangosteen may be particularly noticed. *Cucurbitaceæ* (Gourds) are very numerous; as are also trees of the genus *Ficus* (Fig), some of which produce caoutchouc, and amongst which are the sacred peepul and the banian-tree, so remarkable for the roots which descend from its branches to become new stems, and for the extent of ground which it canopies. Palms are numerous in the tropical parts of A., and particularly in its south-eastern regions, but less numerous than in the tropical parts of South America. The cocoa-nut is one of the most common palms in the vicinity of the sea. Some of the Asiatic palms are valuable for the sago which they yield. The natural order *Dipteraceæ* is one of those that are peculiar to India and South-eastern A., and includes some of the noblest timber-trees; but the Indian teak, so valuable for ship-building, is of the order *Verbenaceæ*. The flora of the Eastern Peninsula, Siam, Cochinchina, and the south-eastern part of A. generally, differs considerably from that of India, and exhibits, if possible, a richer variety. The change from the Indian flora is still greater in the islands, and a resemblance to that of Polynesia and of Australia begins to appear. The bread-fruit takes the place of its congener, the jack of India. These regions produce nutmegs, cloves, and other spices. The *Lauraceæ* are abundant, yielding cinnamon, cassia, and camphor. Gutta-percha has recently been added to the number of the most valuable exports. China and Japan have many plants peculiar to themselves, and are remarkable for the prevalence of the *Ternstroemiaceæ*, the natural order to which the tea-plant and the camellia belong. It is scarcely necessary to mention how extensively tea is cultivated in China, and how important it is in the commerce of the world. The diversity of climate, however, both in China and Japan, is so considerable, as to imply no small diversity of productions. In like manner, the Himalaya Mountains possess a flora very different from that of the Indian plains, and which in some of its most characteristic features, particularly in the prevalence of large rhododendrons and magnolias, has been found remarkably to agree with the flora of the southern parts of the United States; whilst at still greater altitudes there is a strong resemblance to that of more northern regions, or of the

European Alps; forests of pines appear, and along with them the *deodar*, a cedar scarcely, if at all different from the cedar of Lebanon. The mountains of Java also produce oaks and other trees resembling those of the temperate zone, although the species are peculiar. But many parts of A. have as yet been very imperfectly explored.

Many of the cultivated plants of Europe are known to be natives of A., and others are supposed to be so. As the cradle of the human race, and the scene of the earliest civilisation, it is natural to suppose that it supplied the first fruits and other vegetable productions which man sought to improve by cultivation; and of some which, as the apple and the cherry, are probably natives of Europe, it seems probable that the first improved varieties were introduced from A. We do not know with certainty of what part of the earth some of the principal cereal plants or grains are natives—as wheat, barley, oats, and rye; but there seems great probability in the supposition that they are of Asiatic origin. Rice certainly is. It has been cultivated from time immemorial in some of the warm parts of A.; and its introduction into other quarters of the world is comparatively recent. Maize—introduced from America—is now to be reckoned among the most important cultivated plants of A., and its cultivation is rapidly extending, as is that of the potato. Wheat, oats, barley, rye, beans, pease, and buckwheat, are the principal crops of regions similar in climate to those in which they are cultivated in Europe. Barley and buckwheat are cultivated in the Himalayas at the extraordinary elevation of almost 12,000 feet, and crops of barley are to be seen even at 15,000 feet above the sea. Millet of different kinds, durra, and other grains of inferior importance, are cultivated to some extent in India and other warm regions; also different kinds of pulse. The banana and plantain are of the same importance as in other tropical countries; and the yam and coco or eddoes contribute largely to the supply of human food. The sugarcane is cultivated in the warm parts of A., but not with so much spirit or success as in America, although it is a native of the East and not of the West Indies. Pepper is one of the native productions of the East Indies, and is extensively cultivated. Tobacco, whether or not any species of it is indigenous to A., is now produced in large quantities. Indigo is extensively cultivated in India, and the opium poppy too extensively. Different species of cotton are natives of India, and have long been cultivated there and in China. Hemp is cultivated in India, not for its fibres, but to afford the means of intoxication; and flax chiefly for the oil of its seeds; but both hemp and flax are extensively cultivated for their fibres in other parts of A.; and India and the other tropical regions produce many plants valuable for their fibres, among which are species of *Musa*, *Corchorus* (yielding the jute of commerce), and *Urtica* (nettle). Among the crops of India is sesamum, valued for the oil of its seeds.

It seems probable that we are indebted to the warmer temperate parts of A. not only for the orange, the lemon, and all the other species of the genus *Citrus*, but also for the olive, the peach, and nectarine, the apricot, the fig, the mulberry, and the vine, with many other of the fruits now most generally esteemed and cultivated. China and Japan being the seats of an ancient civilisation, many useful plants have long been cultivated there, which have scarcely yet found their way into other parts of the world. Floriculture has been practised there with great assiduity from a remote antiquity; and varieties of Hydrangea, Camellia, Tree Pæony,

Chrysanthemum, &c., have, from time immemorial, been scarcely if at all less numerous than those of the tulip and hyacinth in Holland.

The zoology of A. is not less interesting than its botany. Amongst domestic animals, the most important are the ox and buffalo, the sheep, the goat, the horse, the ass, the camel, and the elephant. A number of species of ox and buffalo are natives of A., from more than one of which the domesticated races appear to have derived their origin. Very distinct from all the others is the yak (q. v.) of Tibet, a creature which is of great use to the inhabitants of the elevated regions of the Himalayas, and is to them almost what the reindeer is to the Laplander. The sheep and goat are natives of the mountainous parts of Central A. The horse and the ass seem to belong to the same regions; and all of these have been domesticated from the earliest times. The camel is of incalculable value as a beast of burden in the regions of heat and drought, and as affording the means of traversing the great deserts. It is used principally in the south-west of A. and in India. The elephant is a native of the tropical parts of A., but is of a different species from that of Africa. The reindeer constitutes the chief wealth of some of the tribes of the north. Dogs are also used by some of the Siberian tribes for drawing their sledges. Different races of dogs are domesticated in different parts of A., and a small kind is fattened for its flesh in China; but in the Mohammedan parts of A., the dog is reckoned an unclean animal, and is known chiefly as a prowler about towns and villages, and a devourer of offal.

The tropical parts of A. abound in monkeys, of which the species are very numerous. Among them are some with long, and some with short tails, but none with prehensile tails, like the sapajous of America. Many are altogether tailless, and among these is the orang-outang, found in the south-eastern islands. A much larger ape, called the pongo, has been said to exist in Borneo, but it is still a doubtful species. The same warm regions abound in bats, many of which are of large size, and feed upon fruits, not upon insects. The flying lemur or colugo is another remarkable animal of the Indian Archipelago.—Bears are found in all parts of A.—the white bear in the extreme north, and other formidable species in the more temperate parts; whilst the tropical regions produce bears which are by no means ferocious, and feed chiefly on insects, fruits, and honey. Badgers are also found in A., and quadrupeds of several other plantigrade genera, allied to the bear, but of comparatively small size and inoffensive habits, as the beautiful Panda (*Ailurus*) of the north of India, and the Binturongs (*Ictides*) of Malacca and the neighbouring archipelago.—Animals of the Weasel family (*Mustelidae*) are numerous, among which the Teledu (*Mydaus meliceps*) of Java rivals the skunks of America in the horrible stench with which it surrounds itself for defence. More important are the sable and the sea otter, pursued in the northern regions upon account of their furs.—Of the Dog family, or *Canidae*, A. has not only wild dogs, but also wolves, foxes, hyænas, and jackals; the two former abounding chiefly in the colder, the two latter in the warmer regions. The arctic fox inhabits the most northerly shores and islands. The warmer parts of A. produce a number of species of the allied family of the *Viverridae*, among which are the mangouste or Indian ichneumon—famous, like the Egyptian ichneumon, for the destruction of serpents—and the civet, from which is obtained a celebrated perfume.—Of feline animals, the most dreadful are the lion and tiger; the latter of which is peculiar to

A., abounding in the warm regions of the south and east, never extending westward beyond the mountains and deserts which separate India from Persia; but, on the contrary, advancing far to the north beyond the limits to which the lion advances, and even to the confines of Siberia. The leopard, the ounce, and many other cats, some of them large and dangerous, are found in A., especially in the warmer parts of it. Among them may be mentioned the chetah or hunting-leopard, tamed for the chase in India.—A few small marsupial (or pouched) quadrupeds (*Phalangers*) are found in the Moluccas, and form one of the links by which the natural history of A. is connected with that of Australia.—The *Glires* or *Rodentia*, on the contrary, are numerous in all parts of A., and many species are peculiar to it. Squirrels, marmots, rats, mice, hares, &c., are common in all except the most northerly regions. The brown rat, now so common in Europe, is said to have emigrated from Persia so recently as the beginning of the 18th c. Lemmings abound in Siberia and the Tatarian deserts, of which the jerboa is also an inhabitant. Porcupines are frequent in the warmer parts of A., and the beaver is found in the north.—Of Edentate quadrupeds, the Pangolins (*Manis*) alone are Asiatic, and these are confined to the tropical regions.—Of *Pachydermata*, there are, besides the elephant, the horse, &c., already mentioned, several species of rhinoceros, wild boars, the banyroussa and a species of tapir; all, except the wild boar, natives of the warmest climates. One of the most interesting facts, however, connected with the natural history of A., is the abundance of remains of the mammoth, or fossil elephant, in the coldest parts of Siberia, its tusks still affording a considerable supply of ivory.—Of ruminating animals, besides those of the ox-kind, already mentioned, and the sheep and goat, there are deer, antelopes, and musks or musk-deer. The reindeer and elk are natives of Siberia; further south, the species of deer are much more numerous, and the same countries produce many species of antelope. The musks are found in the central and southern parts of the continent; one of them, a native of the highest mountains, yielding the much-prized perfume from which it derives its name.—A. possesses vultures, eagles, and other *Falconide*, owls, ravens, and other birds of the crow kind, herons, storks, cranes, &c. Swans, geese, ducks of various species, and many other *Anatide*, frequent its waters, some of them abounding even in the coldest regions. Albatrosses are very numerous on the Kamtschatkan shores; flamingoes on those of the more southern countries. Pigeons abound, and among them is the turtle-dove. The gouras of the Indian Archipelago are birds of the pigeon family, of which one species is almost as large as a turkey. There are many kinds of thrush, finch, warbler, bunting, sparrow, and other birds identical with or allied to those of Europe, among which is the nightingale, often mentioned by the Persian poets, and many also, particularly in the warmer regions, which are peculiar and characteristic. Of these may be mentioned the splendid birds of paradise of the south-eastern islands, peacocks, pheasants, &c. The gallinaceous birds of Asia are numerous, and from this continent were probably derived the domestic poultry of other parts of the earth. The abundance of the parrot tribe constitutes a point of resemblance between the tropical parts of Asia and other tropical countries, but lorries are peculiar to the East Indies. The ostrich inhabits the deserts of Arabia as well as of Africa. The cassowary is found in the south-eastern islands. The edible swallows' nests of the East Indian coasts have long been celebrated.—Lizards and other saurian reptiles are very abundant

in the warmer parts of Asia; and great crocodiles and gavials infest the rivers of the East Indies. Boas, pythons, and other great serpents, are found in the tropical regions, which produce also many venomous serpents. The cobra da capello is one of the most dreaded. But the temperate parts of Asia have also venomous serpents, scarcely less dangerous. Some of the East India tortoises are remarkable for their great magnitude, and turtles are found in the seas.—Both the salt and fresh waters of Asia produce many kinds of fish. The *Salmonidae* of the rivers of Siberia supply an important part of the food of its inhabitants. The goldfish, now so well known in Britain, is a native of China. Some of the fish of the tropical parts of Asia have attracted attention from the peculiarity of their form or habits. Insect life is exceedingly abundant in the warm parts of Asia, as in all other warm countries. Bees are numerous, and honey is produced in great quantities. Of other insects, it seems only necessary here to mention the silk-worm, which was introduced from Asia into Europe; and the locust, which sometimes devastates great tracts of the Asiatic countries bordering on the Mediterranean and the Black Sea, and occasionally extends its ravages into regions further west. Of molluscous animals, the pearl-oyster deserves particular notice, upon account of the important pearl-fisheries which exist in different places.

Ethnography.—The whole population, consisting of 750,000,000 people, may be divided into the Mongolian, Aryan, and Semitic groups. The first of these includes all the peoples and tribes in the east, north, and south-east of Asia; the second, (see ARYAN RACE) embraces the inhabitants of Northern India, Afghanistan, Persia, and part of Asiatic Tartary; the third includes the Syrian, Hebrew, and Arabian races (see ETHNOLOGY).

A further subdivision and classification may be made as follows: 1. The *East-Asian group*, including the peoples of Tibet, China, Japan, Corea, and the Indo-Chinese peninsula; all alike in the use of monosyllabic languages. This last people, however, must be subdivided into Western and Eastern, the former comprising the inhabitants of the Burman empire, Pegu, Laos, and Siam, having affinities with the Hindus; and the latter, comprising the inhabitants of Tonquin, Cochinchina, and Cambodia, have affinities with the Mongolians of Tibet and China. 2. The *Tatar group*, including the Turkomans, Mongols, and Tungusians, who are spread over the whole table-land of Central Asia and the neighbouring lands in the north. The Turkoman family is divided into three sections—the first including the east Turkomans, inhabiting Tashkend, Khiva, Balkh, and Usbekistan; the second including the so-called Tatars of the Urals and the neighbourhood of Astrakhan and Kazan; the third including the Turks or Osmanli. With the exception of a few small tribes in Siberia, all the Turkish varieties are Mohammedans, use the Arabic alphabet, and employ numerous Arabic words in their dialects. 3. The *Siberian group*, including the Samojedes, people of Kamtschatka, &c., speaking languages which have only recently been studied by philologists. 4. The *Malay-Polynesian group*, mixed with Australasian negroes, are spread over all the islands of Polynesia and the Indian Archipelago. The Malayan people of Java, Sumatra, Celebes, the peninsula of Malacca, the Sunda Islands, Moluccas, and Philippines, have an incipient literature, which has been formed under Moslem and (since the 16th c.) under European influence. The South Sea islanders are clearly divided into two races by physical form, colour, and language. One race is allied to the Australasian

negrito, and the other to the Malayan. In most of the islands, there is a partial intermixture of the two races, but generally the distinction is obvious. It is probable that all the copper-coloured Polynesians belong to the same family with the people of the Indian Archipelago. 5. The *Deccan group*, including all the people employing the Tamul, Carnatic, Telugu, and Singalese languages, all having a certain measure of civilisation and a literature. 6. The *Indo-Germanic or Aryan group*, marked and subdivided by the three languages, Sanscrit, Persian, and Armenian. About thirty distinct nations, each having a peculiar dialect and literature, belong to the first subdivision; the second includes the peoples of Beloochistan, Afghanistan, Persia, and Kurdistan; the third, the Armenians. All these families have literatures partly written in dead languages—the Sanscrit, Pali, Zend, and old Armenian. 7. The heterogeneous tribes inhabiting the Caucasus, whose affinities are not yet settled. 8. The *Semitic group*, including all the peoples whose languages are related to the Hebrew and Arabic.

Religions.—The same Asian characteristic of variety and wide contrast is found in the creeds as in the countries and tribes of people: the Brahminical religion of India; the doctrines of Buddha, Confucius, and of Lao-tse in China; the worship of the Grand Lama in Tibet; the creed of Islam in several varieties in Arabia, Persia, and India; the rude heathenism of the north; the various sects of native Christians in Armenia, Syria, Kurdistan, and India; the Greek Church in Siberia; these and other forms of faith or religious profession display diversities and contrasts nearly as striking as those of Asian geography. Christianity, now the religion of Europe and America, owes its origin to Asia. For an account of the existing religious systems of Asia, see articles MOHAMMEDANISM, HINDUISM, BUDDHISM, LAMAISM, &c.

Civilisation.—The number of people civilised—in the Asiatic sense of the word—is far greater than that of wild and nomadic hordes; but culture here, when arrived at a certain point, assumes a stationary character, widely differing from the restless intellectual activity and industrial progress of Europe. The laws of states, families, industry, commerce, art, and science are, in India and China, so many branches of one fixed and permanent religious system, which has maintained its sway through many centuries, and would long remain unchanged, if left undisturbed by European influence. The Arabs, Persians, and Turks, collectively known as the Easterns, are distinct in civilisation from the Hindus and Chinese. The institution of slavery among the former, of *caste* among the Hindus, and the civil and political equality of China, are distinguishing marks. The Turk is a monotheist and fatalist; the Hindu is either a mystical pantheist or polytheist, acknowledging a multitude of gods; the Chinese is rather a utilitarian moralist.

Industry.—The industry and commerce of the Asiatic continent bear no adequate proportion to its capabilities—such as they are, they will be described under the different countries.

Political Aspect.—The political institutions of A. present to us some striking contrasts. While the barbarous hordes in the north live almost without the idea of government, and scarcely know that the Russian czar claims them as his subjects; and the nomadic tribes, under their khans or sheiks, have a sort of patriarchal government, subordinate to higher powers; the most extreme forms of monarchy and despotism have existed among the more cultivated nations. The government of China is an absolute monarchy in form, but, in fact, is strictly limited by the force of tradition. The emperor is apparently

unlimited in authority ; but it is an essential duty of an emperor to rule exactly according to the precepts handed down by his ancestors. Reverence for ancestors and their institutions is, therefore, the sole presiding and conservative principle which has so long preserved the great Chinese empire from political changes. A., now so passive, anciently took an active part in the great movements of the world's history ; contended against Egypt and Greece, and afterwards contributed to the greatness and glory of the Macedonian and Roman empires. From the north of the Caspian Sea, came the vast hordes of the Huns who spread themselves abroad over Europe. The armies of Genghis Khan and Tamerlane overran the Slavonian plains, while the Arab califs, with their fanatical troops, established their religion and government in three quarters of the world. Under the Osmanli fell the eastern Roman empire, and still the Turk maintains a political position in Europe, but one now becoming very feeble and insecure. In proportion as Europe has advanced, A. has declined in political power, so as to countenance the theory of a gradual movement of the spirit of civilisation and progress from the eastern to the western world. It would appear that all great future changes in the destinies of Asiatic nations must proceed from European influence. The Portuguese, Spaniards, Dutch, and French have acquired possessions in India, but all are now insignificant when compared with the vast territory under British government. The following table, from the latest authorities for 1869-70, gives the existing political divisions, with their extent and population, as nearly as the data will permit :

State.	Square Miles.	Population.

A'SIA MINOR, the ancient name of what is now called Anatolia (q. v.). Here, in Ionia, was the early seat of Grecian civilisation, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, &c., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 years B.C.), to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy ; and here took place the wars of the Medes and Persians with the Scythians ; of the Greeks with the Persians ; of the Romans with Mithridates and the Parthians ; of the Arabs, Seljuks, Mongols, and Osmani with the weak Byzantine empire. It was here that Alexander the Great and the Romans successively contended for the mastery of the civilised world. But, notwithstanding all these wars, the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilisation has been sadly brought to ruin.

ASKEW, or ASCOUGH, ANNE, one of the sufferers for Protestant opinions at the dawn of the Reformation in England. Having embraced the views of the reformers, she was turned out of doors by her husband, a gentleman of Lincolnshire, and a zealous Roman Catholic. On this she went up to London to sue for a separation ; but was eventually arrested on a charge of heresy, and was examined by the Bishop of London and others on the doctrine of transubstantiation, the truth of which she denied. After further examination, and torture by the rack, she was burned at the stake, in Smithfield, July 16, 1546.

ASMANNSHAUSEN, a village in the jurisdiction of Rudesheim, Nassau, is famed for the wine which is produced on the slate-mountains in its vicinity. Of this there are two kinds, red and white, the former of which is greatly preferred. It has a rich red colour, like Burgundy, possesses a rare aromatic flavour, and is noted for its uncommon

State.	Square Miles.	Population.

Aden, ...	20	50,000

strength and fire. But it retains its excellent qualities only about three or four years; after which, year by year, it becomes weaker, and loses its colour. The choicest sort, which is preferred by connoisseurs to all the other red wines of the Rhine, and even to Burgundy itself, is cultivated in the ducal vineyards at Wiesbaden.

ASMODE'US (properly, ASCHMEDAI, 'the destroyer'), an evil genius or demon mentioned in the later Jewish writings. A. was described as the author of many evils. In the Book of Tobit (q. v.), he is represented as slaying the seven husbands of Sara, and hence, in modern times, has been jocularly spoken of as the destroying demon of matrimonial happiness. In the Talmud, A. is described as the prince of demons, and is said to have driven Solomon from his kingdom.

ASMON.E'ANS. See MACCABEES.

ASP (*aspis*), a venomous serpent, the name of which has come down from ancient times; the vague descriptions of ancient authors, however, causing uncertainty as to the species. It is very generally supposed to be the *Naja Haje*, the El Haje or Haje Nasher of the Arabs, which is very common in Egypt, Cyprus, &c., and often appears in hieroglyphic and other sculptures as one of the sacred animals of ancient Egypt. It is sometimes from 3 to 5 feet in length, of nearly equal thickness throughout, with a gradually tapering tail; brownish, varied with dark and pale spots; the scales of the neck, back, and upper surface of the tail slightly carinated; the tail about one-fourth of the whole length of the animal. The neck is capable of considerable dilatation, through the distension of its loose

one is called Spuugh Slang, or Spitting Snake, by the colonists, from its supposed power of ejecting its poison to a distance when irritated; the poison which distils from the fangs in such circumstances being probably carried off by the forcible expirations which the creature makes—a characteristic, however, not exclusively belonging to a particular variety.—Other serpents of the same family, *Viperidae*, are by some believed to be the true asp, particularly *Vipera Echis* and *V. Cerastes*. The former is of a grayish or yellowish brown colour, with rays and eye-like spots on the upper parts: it is found both in India and the north of Africa. The latter is of a grayish colour, and has a very broad heart-shaped head, a short obtuse rounded muzzle, and the superciliary or eyebrow scales remarkably developed, so that one of them is often produced into a sort of spine: it inhabits the deserts of Northern Africa.—The name asp is now generally given to *Vipera Aspis*, a native of the Alps, found also in the south-east of Europe and in Sicily, which much resembles the common viper, but is more slender, and has a larger head; it is also more venomous.

ASPARAGUS, a genus of plants of the natural order *Liliaceae*, having an almost bell-shaped six-partite perianth upon an articulated stalk, six stamens, one style, with three recurved stigmas, and the cells of the berry two-seeded. The species of this genus are herbaceous or shrubby plants, natives chiefly of the south of Europe and of Africa, with abortively dioecious flowers; the stem is unarmed in some, in others thorny; at its first sprouting leafless, and covered with scales at the top; afterwards very much branched, with numerous fasciculate, generally bristle-like leaves. The most widely diffused

species is the common A., *A. officinalis*, a native of Europe, which grows on the banks of rivers and on the sea-shore, in meadows and bushy places, especially in sandy soils, occurring in a few places in Britain, and is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, forming a much esteemed article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance, called *Asparagine*, and have a specific action on the urinary organs, so that their long continued use in very large quantities is apt even to produce bloody urine. They are no longer retained in the pharmacopœia, but both the shoots and the roots of A. are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes, the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of A. are most esteemed for the table. It is one of those plants which have been much increased in size, and considerably altered in general appearance, by cultivation, being seldom more than a foot high in its wild state, and not much thicker than a goose-quill, whereas it has been obtained in gardens more than half an inch in diameter, and its stems rise to the height of four or five feet. It was a favourite

vegetable of the ancient Romans. It is generally planted in rows, at distances varying from 1 foot to 2½ feet. Litter or vegetable mould is spread over it in autumn. It is allowed to occupy the same ground for many years, and the shoots are not gathered for use till the plants are four years old. Some of the growers of A. for the London market have 100 acres under this crop.—The seeds have been used as a substitute for coffee, and are recommended for that use upon the continent, even at the

Naja Haje.

skin, although not so much as that of the nearly allied cobra da capello of India (*Naja tripudians*). The dilatation of the neck takes place when the serpent is irritated. The jugglers of Egypt are accustomed to perform tricks with this serpent, as those of India with the cobra da capello, causing it to dance to their music; after they have first, however, carefully extracted the poison-fangs. It is very venomous. Several varieties exist at the Cape of Good Hope, one of which is nearly white; and

present day. A kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*,

Asparagus.

a, a young shoot; *b*, flowers; *c*, the upper end of a stem, shewing branches, leaves, and fruit (all reduced.)

A. acutifolius, and *A. albus*, natives of the south of Europe; the last of which is much used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the Bitter A., *A. scaber*, which is very similar to the Common A., are uneatable on account of their great bitterness.

ASPARAGUS STONE. See APATITE.

ASPA'SIA, one of the most remarkable women of antiquity, was the daughter of Axiochus, and born at Miletus. The circumstance that in Athens all foreign women, whatever their character, were equally esteemed, or rather disesteemed, and that their children, even when begotten in wedlock, were held illegitimate, has originated the erroneous notion that A. was a courtesan. She certainly broke through the restraint which confined Athenian matrons to the seclusion of their own homes; for after her union with Pericles, who had parted from his first wife by her own consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her eloquence and knowledge of politics were extraordinarily great. Her husband—though, strictly speaking, the Athenian law would have refused this appellation to Pericles—was honoured with the title of Olympian Jove, while she herself was dignified with the name of Juno. From the comic writers and others, she received much injustice. It was Hermippus, the comic poet, who took advantage of a temporary irritation of the Athenians against Pericles, to accuse A. of impiety; but the eloquence of the great statesman disarmed the enmity of the judges, and procured her acquittal. Her influence over Pericles must have been singularly great, although this has obviously been exaggerated, and even caricatured. The brilliant but not historically accurate Aristophanes charges her with the origin both of the Samian and Peloponnesian war, the latter on account of the robbery of a favourite maid who belonged to her. Plutarch vindicates her against such accusations; and Thucydides, who details minutely the causes of the Peloponnesian war, does not once

mention her name in connection with these. After the death of Pericles, A. married Lysicles, a cattle-dealer (an important, lucrative, and dignified profession in ancient times), who, through her influence, soon became an eminent man in Athens. The name of A. was, after her death, applied to many women of remarkable accomplishments and amiability.

A SPECTS, in astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five Aspects—Conjunction (indicated by the symbol $\odot$), Sextile (*), Quartile ($\square$), Trine ($\triangle$), Opposition ($\otimes$). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90° ; trine, when it is 120° ; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these A. great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*.

ASPEN, or TREMULOUS POPLAR (*Populus tremula*, see POPLAR), a tree which grows plentifully in Europe and in Siberia. It is a native of Britain, and is frequent in Scotland, where it is found even at an elevation of 1500 feet above the sea. It has received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen leaf has become

Aspen (*Populus tremula*), reduced.

a, a portion of a branch with catkins; *b*, do., with leaves.

proverbial. The leaves are nearly orbicular, but broadly toothed, so as almost to exhibit angles. The footstalks are compressed, which favours the readiness of motion. It grows quickly, with a straight stem, reaching to a height of from 60 to 80, or even 100 feet. In unfavourable situations, it becomes dwarfish. The wood is soft, porous, light, white, and smooth; it does not make good fuel, but is very fit for the turning-lathe, and especially for being made into troughs, trays, pails, &c. It is deemed excellent for arrows. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and is then capable of being used as timber for the interior of houses; and on this account the tree is of great importance in many districts, and the more so as it succeeds in any soil, although it prefers one which is moist and gravelly. The bark contains a great quantity of a bitter alkaloid, *Salicin*. The charcoal made from this tree can be used in the manufacture of gunpowder.—*Populus*

tremuloides, a very similar species, a native of North America, is called the American A. It is regarded by some as a mere variety. Very similar, also, is another North American species, *P. monilifera*, or cotton wood of the Western states.

ASPERGILLUM, a remarkable genus of Lamellibranchiate Conchiferous Mollusca, in which the shell has the form of an elongated cone, terminating at the larger end in a disc, which is pierced with numerous small tubular holes, the little tubes of the outer range being largest, and forming a sort of ray around it. The animals of this genus are borers, some of them living in sand, others burrowing in stone, wood, or thick shells. *A. Javanum* is popularly called the Watering-pot, and the same resemblance has suggested the name A. (from the Latin *aspergo*, to sprinkle). The most interesting circumstance in the structure of the shelly tube of A. is the presence of two small valves incorporated in the substance of the tube, to which they

Aspergillum.

a, the disc with holes; *b*, the rudimentary valves. Owen, 'of its true affinities, but subserve as little any ordinary final purpose as the teeth buried in the gums of the fetal whale.' The affinities are with mollusca inhabiting bivalve shells. A rudimentary bivalve shell is found, in like manner, cemented into the shelly tube of the fossil *Teredina*, which bored the drift-wood of the London clay.

There is also a genus **ASPERGILLUS** in Botany, containing many of the small fungi commonly known by the name of Mould (q. v.), which occur on decaying substances of various kinds. Some of the species are peculiar to diseased animal tissues.

A'SPERN, or **GROSS A'SPERN**, a village of Austria, on the left bank of the Danube, 5 miles E.N.E. of Vienna. Pop. about 700. This village and the neighbouring one of Essling are celebrated as the scene of a sanguinary battle in the summer of 1809, between the French army under Napoleon I. and the Austrians under Archduke Charles. After the battle of Eckmühl, in which the Austrians were defeated, the Archduke retired to the left bank of the Danube, leaving the road to Vienna open to the French. On the 12th of May, 1809, the French army entered Vienna, when the Archduke concentrated his forces on the opposite bank of the river. Napoleon threw bridges over the river, and on the 21st the French army began crossing to the attack. The Austrians at first seemed to give way; but when about half the French had crossed the river, they returned to the charge, and almost surrounded the enemy in the narrow plain between the two villages. Here ensued the battle of Aspern, a terrific conflict, the grand object of the contending hosts being the possession of the villages. At the close of the day it remained undecided; but next morning it was renewed with fury on either side, when, after terrible slaughter, Napoleon ordered a retreat, and his shattered ranks retired to the little island of Lobau, in the middle of the river, whence they afterwards slowly withdrew to the right bank. The loss on the side of the Austrians was given at 4000 killed, and 16,000 wounded; that of the French at double that amount. Marshal Lannes, the most daring among the French generals, was among the slain. Both the villages were reduced to heaps of ruins.

ASPERULA. See **WOODRUFF**.

ASPHALT, or **ASPHALTUM**, is the name given to a bituminous substance of a solid consistence. See **BITUMEN**. It probably owes its origin to vegetable matter which has been subjected to a slow process of decomposition or decay, resulting in the production of a bituminous coal, from which, by volcanic agency, the A. has been distilled and diffused over the neighbouring district. The largest natural deposit of A. is in the island of Trinidad, where the plain known as the *Pitch Lake* is found. See **TRINIDAD**. The A. from Trinidad is largely used for ships' bottoms, and is reputed to kill the teredo or borer, which proves itself so very destructive to the wood of ships in tropical regions. A. is also found on the shores of the Dead Sea in large quantity, and is known to the Arabs by the name of *Hajar Mousa*, or *Moses's Stone*. It likewise occurs in South America at Coxitambo near Cuenca, in Alsace, and other parts of the European continent, in East Lothian and Fifeshire (Scotland), in Shropshire, &c.

During the manufacture of coal-gas, much tarry matter is evolved from the retort, and is received in the coolers and condensers. If this tar be subjected to partial distillation, naphtha and other volatile matters escape, and an artificial A. is left behind, which possesses the principal properties, and can be employed for the majority of purposes to which native A. is applied. The various kinds of A. have a pitchy odour, are of a black, or dark-brown colour, but do not soil the fingers; are insoluble in water, sparingly soluble in alcohol; but are in great part dissolved by ether, oil of turpentine, and naphtha. *Petroleum* (q. v.), or *Rock Oil*, is a native liquid bitumen, which largely exudes from crevices in rocks in many districts, and is essentially A. dissolved in naphtha. The specific gravity of A. is very near that of water, ranging from 1000 to 1100. When set fire to, it burns readily with a smoky flame, and is often used in the smaller gas-works as fuel, by being allowed to run very slowly into the furnace fires. A., besides being employed for coating the exterior of ships' bottoms, is also used, in a heated condition, for saturating timber which is intended for piles in the construction of break-waters, river-bridges, and other situations where the combined action of the air, water, and minute animals would soon render ordinary wood rotten and useless. Wooden houses may be preserved in the same manner by a coating of A. applied externally; and ground-flooring placed in damp situations is much the better of the spaces between the planks being filled up with A.

About 1840, A. began to be generally used for foot-pavements in cities, and also for floors of cellars and outhouses. For purposes of this nature it is heated in portable boilers, into which, at a certain stage of the preparation, there is poured a quantity of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid A. The mixture is then spread on the spot prepared for it; and when cool, forms a hard kind of pavement. Of this method of forming footways, high expectations were at first formed; but latterly the process of asphaltting has gone out of use in England, as it is found not to be so durable as stone, and therefore, in ordinary circumstances, more costly. In Paris, however, asphaltting is still extensively practised in the more spacious thoroughfares. The better kinds of A. are used in the manufacture of the black varnish, which is employed in forming the enamel which coats the variety of leather known as *Patent Leather*. A. is not of itself used in medicine, but its natural solution in naphtha, viz., *Petroleum*, is a valuable agent when applied either externally or internally. The synonyms of A. are—

Natwe Pitch, Mineral Pitch, Jews' Pitch, Dead Sea Bitumen, Compact Bitumen, Trinidad Bitumen, and Maltha.

ASPHODEL (*Asphodelus*), a genus of plants which has by many botanists been made the type of a natural order *Asphodeleæ*, now, however, generally regarded as forming part of the order *Liliaceæ*. The *Asphodeleæ* are either fibrous-rooted or bulbous-rooted. Among the latter, are onions, hyacinths, squills, star of Bethlehem, &c.; among the former, asparagus, A., &c. The roots of the asphodels are

White Asphodel.

fleshy and thick. The species are not very numerous, and are mostly natives of the countries around the Mediterranean Sea. The Yellow A. (*A. luteus*) and the white A. (*A. albus*) have long been known in Britain as garden-flowers. The yellow A. has an unbranched stem 2–3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the white A. are all radical, and its flowers are in branched clusters. Both species flower about the time when spring passes into summer.

ASPHYXIA (Gr.) means literally a cessation of the pulsation from any cause, but is usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid for oxygen. See **RESPIRATION**. A., or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the

phrenic nerve, thus paralysing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen in proportion to other elements, as carbonic acid or sulphuretted hydrogen, which act as poisons when inhaled. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with the gases just mentioned.

As this condition of A. advances, in drowning or otherwise, the small vessels of the lungs become gorged with blood, which the heart has no longer power to force freely through them, the right side of the heart and pulmonary artery become filled with blood, while but little returns to the arterial or left side of the heart.

The person becomes pallid, except in such vascular parts as the lips, cheeks, and finger-tips, which become blue; and soon the blood, no longer aerated, produces the phenomena of poisoning by carbonic acid. After some slight convulsive movements, the person becomes insensible, the pulsations of the heart grow gradually feebler, and at last cease altogether. In man this occurs in from a minute and a half to five minutes. Some persons, no doubt, as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after apparent death. The object of all methods is of course to fill the lungs with fresh air. The most efficient is that of the late Marshal Hall: lay the person down at once with his head on his left arm, open the mouth, and draw the tongue forwards, then roll him gently over towards the left till he is nearly quite over on his face, then on to his back again, making the body by its own weight compress the chest, which, on its expansion by elasticity, fills with air. Repeat this about 15 times in a minute. This remedy has of late nearly superseded all others for the restoration of still-born infants and other asphyxiated persons. It should be persevered in for a long time, especially in cases of drowning, as even after an hour it has been successful.

ASPHYXIANTS. Chemical substances enclosed in shells or other projectiles, and which act by producing a suffocating and poisonous effect. The French secretly made experiments with asphyxiating shot at Brest in 1851. The principle of these missiles seems to have been to carry into an enemy's ship the means of generating deadly gases which would suffocate the crews between decks. Scientific artillerymen dread and discountenance these novelties; they have learned to regard war almost as a mathematical science, or, at any rate, as an elaborate application of such science; and they see nothing but savage cruelty in the 'diabolical chemistry' of asphyxiants. General Sir Howard Douglas, in a late edition of his *Naval Gunnery*, says: 'The author learns, with great regret, that some awful experiments have been made with fearful success, in the royal arsenal, with asphyxiant projectiles, combining in a frightful degree incendiary with suffocating effects.' Adverting to sick and wounded men on board a ship-of-war, he exclaimed: 'What shall be said of that inhuman system preparing for naval warfare in this age of enlightened humanity, which would advisedly, purposely, and deliberately consign the whole of these, and all other survivors, to indiscriminate death or mutilation? A ship may be sunk in action; yet there is always time to remove the sick and wounded, and save the survivors; but who shall approach a ship on fire to rescue her crew from the sudden and awful effects of that merciless

and barbarous system, the object of which is to set fire to her at heart, and, if possible, blow her up? The Earl of Dundonald, Captain Norton, Mr Macintosh, and many other inventors, have within the last few years brought asphyxiating compositions before the notice of the English Admiralty and War-office; and the French are known to possess many such in store. Some of these compositions are liquids which burn fiercely, and ignite wood and canvas readily; some are contained in shells which, on bursting, scatter the suffocating and burning substances all around; and some assume other forms.

ASPIDIUM. See MALE FERN.

ASPINWALL, a town in New Granada, virtually, however, a colony of the United States. It is situated at the Atlantic extremity of the Panama Railway, in lat. 9° 22' N., and long. 79° 55' W., being about eight miles to the north of the old Spanish port of Chagres, 49 miles from Panama, and equidistant from the great trading capitals of Valparaiso and San Francisco. From its commanding position as a place of transit, A. is one of the busiest and most prosperous towns in the new world. It monopolises the benefits of the traffic in both directions, to the almost utter exclusion of the rapidly decaying Panama. Already the great link between the Atlantic and the west coasts of America, it promises at no distant day to connect that ocean with Australia, India, China, and Japan.

ASPIRATE, the name given to the letter *h* in grammar, as marking, not an articulate sound, but a *breathing* (Lat. *spiro*, I breathe). It is also applied to a class of consonants. There is felt at once to be a relation, accompanied by a difference, between *p* and *f*, *t* and *th*, &c. To express the difference, the Greeks called the first of such a pair *psilon* (bare), the second *dasu* (rough); the Latin grammarians adopted the terms *lene* and *aspirate*, probably from the erroneous notion that the difference consists in the addition of the sound of *h*. There being no sound and no character in Latin corresponding to the Greek *θ* (*theta*), the Romans represented it by *th*; and this misleading expedient is continued for representing this aspirate and several others in all the alphabets derived from the Roman. According to some, the word ought to be *asperate*, i. e., 'roughened.' Of the sixteen mutes in a complete system (see LETTERS), eight are *lene*, each having its corresponding aspirate.

Lene—*p, b, t, d, k, g, s, z.*
Aspirate—*f, v, th(in), th(ine), ch, gh, sh, zh.*

In the corresponding words of allied languages, nothing is more common than the interchange of an aspirate and a *lene*: Ex., Lat. *pater*, Eng. *father*; Gr. *thura*, Ger. *thür*, Eng. *door*; Lat. *cap(ut)*, Fr. *chef*, Eng. *chief*; Ger. *weib*, Eng. *wife*. Aspirated letters are also frequently interchangeable with one another: thus, Gr. *ther*, a wild beast, is in Lat. *fera*; Lat. *facere*, to do, becomes in Span. *hacer*.

ASPIRA-TOR is the name of an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical chemist. The simplest form represented in the figure,

Aspirator.
of the apparatus is that

where A is a large vessel capable of being filled with water, having a tube with stop-cock at B, a second tube with stop-cock at C, and a thermometer introduced at D. In working, the apparatus is filled with water; the tube C is attached to the vessels through which the gas is to be drawn; and the stop-cocks at C and B being opened, the weight of the water escaping at B acts as suction, and draws in the gas from the tube C and the attached bottles or other vessels. The thermometer at D denotes the temperature of the water, and subsequently gas, contained in the reservoir, while the upright turn of the tube B keeps any air from entering the reservoir by that route.—A more complicated form of A., but one which is much more convenient to experiment with, is that known as Brunner's A.; the principle of action, however, is the same.

ASPLENIUM, a genus of Ferns, of the order or sub-order *Polypodiaceæ*. The species are numerous, and widely diffused both in the northern and southern hemispheres. Many of them are of great beauty; and the small size of some recommends them to cultivators of ferns who find themselves much limited as to space. Some of the species bear the English name *Spleenwort*, as *A. Trichomanes*, *A. viride*, *A. Adiantum-nigrum*, &c., having been formerly supposed efficacious in removing obstructions of the viscera. From the same circumstance of the name A. (Gr. *a*, privative, and *splen*, the spleen) is derived. They have now fallen completely into disuse, but were at one time very much employed, chiefly in the form of a syrup like *Capillaire* (q. v.), and were administered not only in cases of cough, asthma, diseases of the liver, and cutaneous diseases, but even in stone and gravel. But perhaps none of them was so extensively used as the species which is styled in old books Common Spleenwort (*A. Ceterach*), now the type of a distinct genus, and known as *Ceterach officinarum*. Some of them, as *A. Trichomanes* and *A. Adiantum-nigrum*, are frequently called Maidenhair. *A. Trichomanes* is a very beautiful little fern, common on rocks and old walls in Britain, and most parts of Europe, found also in some parts of Africa, and in North America. A very common British species, *A. Ruta-muraria*, popularly known as Wall-rue, is found in N. America.

ASS (*Equus Asinus*), a well-known quadruped, usually referred by naturalists to the same genus with the horse (q. v.), but which it has recently been attempted to make the type of a distinct genus (*Asinus*), including all the solid-hoofed quadrupeds (*Solidungula* or *Equida*, see HORSE) except the horse itself. The distinction is founded on the short hair of the upper part of the tail and the tuft at the end of it, the darker stripes with which the colour is marked, and the absence of the hard horny warts which are found on the hinder-legs of the horse, although the fore-legs exhibit warts in a similar position. The long ears of the A. are one of the characteristics of the species, but they are longer in domestication than in a wild state. It is usually also distinguished by a black cross over the shoulders, formed by a longitudinal and a transverse streak, the general colour being gray; but when the general colour is darker or lighter than usual, the cross is often less apparent, or to be observed with difficulty. The facial line is arched.

Some uncertainty still exists as to the origin of the domestic A.; a number of wild races having been described, some of which are perhaps, like the wild horses of America, the progeny of animals that have escaped from domestication. The probability, however, appears to be that the A. is a native of Central Asia, where it is found in a perfectly wild state, in Tartary, Mesopotamia, Persia, &c., on the

banks of the Indus, and even to the southern extremity of Hindustan; but its range does not extend so far northward as that of the wild horse—a circumstance which may perhaps partly account for the inferiority of the domestic A. in northern climates. The wild A. is found both in mountainous districts and in plains; vast troops roam over the great Asiatic deserts, migrating, according to the season, in summer, as far northward as the Ural; in winter, southward to the borders of India. It is fond of bitter and saline herbage, and of brackish water. It was first accurately described by Pallas, under the name *Koulán*, which it bears on the high steppes around the Caspian Sea. It was, however, well known to the ancients, and is called *Onager* and *Asinus sylvestris* by Pliny, who also mentions, under the name *Hemionus*, another species (*Equus Hemionus*), a native of the same regions, now called the *Kiang*, or the *Dziggethai*. The latter name appears to be of Turkish origin, and to signify Mountain A., but seems to be sometimes applied to the one of these species and sometimes to the other. This seems also to be the case with some of their other eastern names, as *Khur* or *Goor*, and is a source of no little confusion.—The cross on the shoulders is less observable in the *Koulán* than it usually is in the domesticated A. It ought also to be mentioned that, in one remarkable particular, the domesticated A. agrees with the *Equus Hemionus*, and differs from the *Koulán*, the infra-orbital foramen of the skull being situated much lower. But the *Kiang* neighs like a horse, and the other brays. The harshness of the voice of the A. is ascribed to two small peculiar cavities situated at the bottom of the larynx.

The allusions to the wild A. in the Old Testament, and particularly in Job xxxix., naturally excite the surprise of readers acquainted only with the dull domestic drudge, the emblem of patience and stolidity; but to this day they are beautifully appropriate to the wild A. of 'the wilderness,' which has the 'barren land' or 'salt places' for its dwelling, and 'the range of the mountains' for its pasture.—The wild A. has a short mane of dark woolly hair, and a stripe of dark bushy hair runs along the ridge of the back from the mane to the tail. It has longer legs, and carries its head higher, than the domestic A. Its troops have always a leader. It is a high-spirited animal, very fleet and very wary, trying to the utmost the powers of the hunter. It is a principal object of the chase in Persia, where its flesh is prized as venison is in Europe, and it is accounted the noblest of game. Xenophon, in his *Anabasis*, describes the wild A. as swifter of foot than the horse, and its flesh as like that of the red deer, but more tender.

The domestic A. is also, in Arabia, Persia, Syria, and other eastern countries, a much finer animal than as it is usually seen in Europe, although in Spain the favorable influence of the more genial climate upon its development is visible, perhaps also of better treatment, the A. being more highly valued. The A. is much used for riding in the East. From Judges v. 10, we learn that, at a very early period, the great were accustomed to ride upon white asses, and a preference is given to white asses in the East to this day. The A. has been domesticated from the earliest times; but it does not seem to have been introduced into Europe till a comparatively recent date. In Britain, it is employed chiefly by the poor, but might probably with advantage be much more generally employed than it is. Its price is scarcely one-twentieth of the price of the horse, and it can be kept at one-fourth of the expense, delighting in the coarse herbage which other animals reject, and satisfied with comparatively scanty fare. The obstinacy

ascribed to the A. seems to be very generally the result of ill treatment; and proverbial as it has be-

The Wild Ass.

come for stupidity, it is probably quite equal in intelligence to the horse.

There are two hybrids between the A. and the horse—the *MULE* (q. v.), bred between the male A. and the mare; and the *HINNY* (q. v.), the offspring of the horse and the female A.

The milk of the A. contains more sugar of milk and less caseine than that of the cow, and is therefore recommended as a nutritious diet in cases of weak digestion. Its usefulness in cases of consumption has been long known, and it was often prescribed as a kind of specific when that disease was treated on principles very different from those which regulate its treatment now, and when very nutritious food was not usually prescribed to consumptive patients.

The leather called *Shagreen* (q. v.) is made by a peculiar process from the skin of the A., which also affords excellent leather for shoes, and the best material for drums. The bones of the A., which are very solid, were used by the ancients for making flutes.

ASSAI, a beverage very much used at Pará and other places on the Amazon, and which is prepared from the fruit of certain species of palm nearly allied to the Cabbage Palm of the West Indies. See **ARECA** and **CABBAGE PALM**. The A. palms are remarkably slender trees; the most common species (*Euterpe oleracea* of Martius) rising to the height of sixty or eighty feet, with a smooth stem only about

Assal Palm (*Euterpe oleracea*.)

as a cabbage or as a salad with oil and vinegar; but it is too much valued upon account of its fruit to be often cut down for these purposes.—Another species, *Euterpe Catinga*, is found in forests of a dry sandy soil and very peculiar vegetation, known as Catinga forests. The beverage made from it is sweeter than the common kind, but the produce of the tree is much smaller.

ASSA'L, an important salt-lake in the east of Africa, 25 miles south-west of Tajurrah, the chief seaport of Adel, lat. $11^{\circ} 40' N.$, long. $42^{\circ} 40' E.$ Its length is 8 miles; its breadth, 4. It lies in a land remarkable for its wild, waste, and sterile character. A. is enclosed on all sides but the east by hills, and is nearly 700 feet below the level of the sea. Abyssinian caravans resort to it for the purpose of carrying off the salt which incrusts its shores like ice, sometimes to the depth of half a foot. It has been supposed that it was at one time connected with the Bay of Tajurrah.

ASSA'M, a province at the north-east extremity of British India, stretching in N. lat. from $25^{\circ} 40'$ to $28^{\circ} 17'$, and in E. long. from $90^{\circ} 40'$ to $97^{\circ} 1'$, and containing 710,000 inhabitants on an area of 21,805 square miles. It forms part of the basin of the Lower Brahmaputra, and is intersected also by about sixty other rivers. Being thus irrigated, as it were, by nature, A. abounds in wood, and is very fertile. Among its indigenous productions is the tea-plant, which, under the management of a joint-stock company, promises to be at once beneficial to the country and profitable to the shareholders. The other products are rice, mustard, gold, ivory, amber, musk, silver, iron, lead, petroleum, and coal. From Bengal the principal imports are woollens, India fabrics, salt, opium, glass, earthenware, tobacco, betel, &c.

In 1826, at the close of the first Burmese war, A. was ceded to the British. The upper portion of the

province, however, was conferred, as a separate principality, on the native rajah, whom the Burmese had expelled; and it was only in 1838, that, in consequence of his misgovernment, the entire country was actually placed under British administration. Since then, the province has exhibited a noticeable improvement, for which, considering that the population is barely 33 to the square mile, there is still, however, almost unlimited scope. The great evil is the prevalence of earthquakes, few months passing without a shock or two. The people, however, seem to think lightly of them—the only one that is specially remembered as being of extraordinary severity having occurred as far back as 1307.

A. is divided into Upper and Lower, which are again subdivided into districts. Gowhati is the only town worthy of the name.

One of the most striking features of A. is the abundance of wild animals, such as tigers, rhinoceroses, leopards, buffaloes, and elephants. Of the elephants, not less than 500 are annually caught; and, when tamed, bands of them may be seen, harmless as cows, in the charge of a single attendant. The forests teem with game, and the rivers with fish.

ASSAS'SINS, a military order, a branch of the secret sect of the Ismaelites (q. v.). The secret doctrines of the Ismaelites, who had their headquarters in Cairo, declared the descendants of *Ismael*, the last of the seven so-called imams, to be alone entitled to the califate; and gave an allegorical interpretation to the precepts of Islam, which led, as their adversaries asserted, to considering all positive religions equally right, and all actions morally indifferent. The atrocious career of the A. was but a natural sequence of such teaching. The founder of these last, Hassan-ben-Sabbah-el-Homairi, of Persian descent, and imbued with the free-thinking tendencies of his country, had, about the middle of the 11th c., studied at Nisapur, under the celebrated Mowasek, and had subsequently obtained from Ismaelite *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of dai. But on betaking himself to the central lodge at Cairo, he quarrelled with the heads of the sect, and was doomed to banishment. He succeeded, however, in making his escape from the ship, and reaching the Syrian coast, after which he returned to Persia, everywhere collecting adherents, with the view of founding, upon the Ismaelite model, a secret order of his own, a species of organized society which should be a terror to his most powerful neighbors. In 1090, Hassan conquered the fortress of Alamut, in the Persian district of Rudbar; and continued to increase in strength, intimidating princes and governors by a series of secret murders, and gaining possession of several fortified castles, with their surrounding territories, both in the mountain range south of the Caspian, in Kuhistan, and in the mountains of Syria (Massiat). The internal constitution of the order, which had some resemblance to the orders of Christian knighthood, was as follows: First, as supreme and absolute ruler, came the Sheikh-al-jebel, the Prince or Old Man of the Mountain. His vicerents in Jebal, Kuhistan, and Syria were the three *Dai-al-kebir*, or grand-priors of the order. Next came the *Dais* and *Refiks*, which last were not, however, initiated, like the former, into every stage of the secret doctrines, and had no authority as teachers. To the uninitiated belonged first of all the Fedavies or Fedais—i. e., the devoted: a band of resolute youths, the ever ready and blindly obedient executioners of the Old Man of the Mountain. Before he assigned to them their bloody tasks, he used to have them thrown into a state of

ecstasy, by the intoxicating influence of the *Hashish* (the hem-plant), which circumstance led to the order being called Hashishim, or hemp-eaters. The word was changed by Europeans into Assassins, and transplanted into the languages of the West with the signification of murderers. The Lasiks, or novices, formed the sixth division of the order, and the laborers and mechanics the seventh. Upon these, the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as null. The catechism of the order, placed by Hassan in the hands of his dais, consisted of seven parts, of which the second treated, among other things, of the art of worming themselves into the confidence of men. It is easy to conceive the terror which so unscrupulous a sect must have inspired. Several princes secretly paid tribute to the Old Man of the Mountain. Hassan, who died at the age of 70 (1125 A.D.), appointed as his successor Kia-Busurg-Omid, one of his grand-priors. Kia-Busurg-Omid was succeeded in 1138 by his son Mohammed, who knew how to maintain his power against Nureddin and Jussuf-Salaheddin. In 1163, Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islam in the Assassin state; which led to his falling a victim to his brother-in-law's dagger. Under the rule of his son, Mohammed II., who acted in his father's spirit, the Syrian Dai-al-kebir, Sinan, became independent, and entered into negotiations with the Christian king of Jerusalem for coming over, on certain conditions, to the Christian faith; but the Templars killed his envoys, and rejected his overtures, that they might not lose the yearly tribute which they drew from him. Mohammed was poisoned by his son, Hassan III., who reinstated Islamism, and thence obtained the surname of the New Moslem. Hassan was succeeded by Mohammed III., a boy of nine years old, who, by his effeminate rule, led to the overthrow of the order, and was eventually murdered by the command of his son, Rokn-eddin, the seventh and last Old Man of the Mountain. In 1256, the Mongolian prince, Hulagu, burst with his hordes upon the hill-forts of Persia held by the Assassins, which amounted to about a hundred, capturing and destroying them. The Syrian branch was also put down about the end of the 13th c., but remnants of the sect still lingered for some time longer in Kuhistan. In 1852, the A. reappeared in Syria, and indeed they are still reported to exist as a heretical sect both there and in Persia. The Persian Ismaelites have an inaum, or superintendent, in the district of Kum, and still inhabit the neighbourhood of Alamoot under the name of Hosseins. The Syrian Ismaelites live in the district of Massiat or Massyad. Their castle was taken from them in 1809 by the Nossaries, but afterwards restored. See Hammer, *Geschichte der Assassinen* (Stutt, und Tüb. 1818).

ASSAULT. In the sudden and vigorous attack of a fortified post, which is called an *A.*, the troops are told off into 'storming-parties,' 'supports,' and 'firing-parties.' The storming-parties are those who take the most terrible duty, being that of making a forcible entry into the place. The firing-parties or musketeers seek to shield the storming-parties as much as possible from the fire of the enemy; they spread themselves out in extended order, to keep down the fire of the garrison—aiming at any soldier who may shew his head above the parapet, and seeking to disable the artillerymen by firing into the embrasures. Many assaults are made by *surprise*; and in that case the storming and firing parties order all their preliminary movements as

quietly as possible. In most cases, there is a necessity for the stormers to descend into a dry ditch, and to ascend from the ditch to a breach or a gate in the fortified wall. To aid in this duty, 'ladder-parties' are placed at the disposal of the storming-parties; these men have previously been practised in carrying scaling-ladders, descending and ascending ditches, and adjusting the ladders. In some celebrated sieges, ladders 40 feet long have been used, where the ditch was deep and the wall or bastion high; but it is seldom that a storming-party could venture on so perilous a work, for the men crowded on such a ladder would endanger each other. The 'supports' are troops who keep a little in the rear of the storming and firing parties; it is their duty to advance as soon as the first obstacle has been overcome.

ASSAY, or **ASSAYING**, is the process employed in determining the proportion of pure metal in a metallic ore or in an alloy. This method of analysis is more generally followed in the examination of compounds of silver and gold, but is likewise resorted to in the investigation of ores of iron, copper, tin, zinc, bismuth, antimony, mercury, and lead. In manufactured articles, also, such as silver-plate and gold-plate, some foreign metal (generally copper) is present, to impart hardness to the metal; and in Great Britain, each article is assayed at the Goldsmiths' Hall, previously to being sold, so as to determine the exact richness of the metal whereof it is made. In the *A.* of compounds containing silver, the apparatus employed is a *cupel*—a small

Cupel.

basin-shaped vessel of the form and size of the figure, made of bone-ash; and a *muffle*, composed of fire-clay, about 8 inches in length and 3 to 4 inches in diameter, shaped like a miniature railway-tunnel,

Muffle.

open at the one end, A, closed at the other end, B, and having numerous slits or air-holes, C, along the side. The more simple A. of silver consists in the examination of argentiferous lead ore. By a preliminary process, the sulphur is separated (see **LEAD**); and weighed fragments of the mixed lead and silver being placed on cupels, the latter are introduced into the muffle, which has been previously heated in a furnace, where it still remains. The fire is then increased, and air being admitted to the muffle, the oxygen of the air unites with the lead, forming oxide of lead (PbO), which in part volatilises through the openings in the side of the muffle, and in other part sinks into the porous bone-earth of which the cupel is made. Whilst the lead is thus carried away, the silver remains behind as a molten metallic globule, and when the last traces of lead-fumes leave the silver bead, the latter suddenly *lightens*, and immediately thereafter becomes brilliant and white. On being slowly allowed to cool, the globule of silver may be weighed, and the amount of pure metal

thus determined. The use of the cupel during this process has led to the term *cupellation* being employed in place of A. When silver contains copper, which it does in ordinary coinage and silver-plate, it becomes necessary to mix lead with the alloy before attempting to separate the copper. The manner in which the lead is generally added is to roll the alloy of silver and copper in a piece of sheet-lead or lead-foil, and place the whole package on the cupel. During the heating in the muffle, the lead oxidises as usual, and in part passing into the bone-earth of the cupel, carries the copper with it. The amount of lead required to effect the separation of copper from silver in this way is given in the following table:

Standard of Silver in One Part.	Amount of Copper Alloy in One Part.	Quantity of Lead Necessary for One Part of Alloy.	Quantity of Lead in Relation to that of Copper.
1000	0	$\frac{3}{10}$	part.
950	50	$\frac{3}{8}$	parts.
900	100	7	70 " 1
800	200	10	50 " 1
700	300	12	40 " 1
600	400	14	35 " 1
500	500	16 to 17	32 " 1
400	600	16 " 17	27 " 1
300	700	16 " 17	23 " 1
200	800	16 " 17	20 " 1
100	900	16 " 17	18 " 1
Pure copper.	1000	16 " 17	16 " 1

The metallurgic chemist, while performing an A., can determine, by the examination of the stains on the cupel after the process has been finished, what metal may have accompanied, and been separated from, the silver, even in minute quantity. Thus, lead alone imparts a straw-yellow or orange stain; copper, a gray or dark-brown tint; and iron, a black stain.

During the A. of silver by the foregoing or *dry* method, a certain loss of metal generally occurs, which averages 2 parts in 1000; and this circumstance has induced the authorities in the mints of Great Britain, France, and other European kingdoms, as well as the United States, to adopt a *humid* process for the A. of silver, which will determine the value of a silver alloy to within 0.5 (or half a part) in 1000. The humid or wet A. consists in dissolving the compound of silver in nitric acid of density 1.25, and thereafter adding a solution of common salt (chloride of sodium NaCl), which causes the precipitation of the chloride of silver (AgCl) in white flocculi. The common salt is made of a definite strength, and is poured out of a measured or graduated vessel, till all further precipitation of the silver ceases, when the amount required of the solution of common salt is read off, and by a simple calculation its equivalent in pure silver is obtained.

The A. of gold ores is conducted in a manner similar to that of silver. When the ore contains gold, lead, and copper only, it suffices to mix more lead with it, and heat in the cupel in the muffle furnace, when the lead and copper sink into the cupel, and the gold forms a globule on the upper surface. The proportion of lead required is regulated by the amount of copper present in the alloy.

Proportion of Gold contained in One Part of the Alloy.	Quantity of Lead necessary to completely remove the Copper by Cupellation.
1000 thousands	1 part.
900	10 parts.
800 "	16 "
700 "	22 "
600 "	24 "
500 "	26 "
400 " and under.	34 "

When the gold is accompanied by silver as well as copper, iron, and lead, it is necessary in the first place to subject the alloy to the A. process in the ordinary way, which gets rid of the copper, iron, and lead, but leaves the silver still incorporated with the gold. The weight of this residual bottom gives the combined weights of the silver and gold present in the alloy. The method of separating the silver from the gold is called *parting*, and consists essentially in acting on the alloy with hot nitric acid, which dissolves away the silver, forming the soluble nitrate of silver (AgONO_2), and leaves the gold undissolved. When the silver is present in small proportion, the gold assumes a protective influence, and keeps the nitric acid from acting on the silver; and to effect this separation satisfactorily, it is necessary that there should be about three parts of silver to one of gold. As that proportion does not occur naturally, or in any kind of manufactured gold plate, it is requisite to incorporate some silver with it. This is generally accomplished by taking the proper quantities of gold and silver, wrapping them up in a piece of lead-foil, and heating on a cupel. The lead, during its disappearance from the heating vessel, causes the most intimate amalgamation of the silver and gold, which are left on the cupel as a metallic button. The latter, on being allowed to cool, is beaten out on an anvil with a smooth hammer, and is then passed through steel rollers, which yield a ribbon of alloy about the thickness of an enamelled address-card. The ribbon of metal being coiled up, is technically called a *cornet*, and when introduced into the flask with nitric acid, the entire solution of the silver is accomplished, whilst the gold is left as a brown-coloured spongy mass, of the shape and size of the cornet. To give the metal the appearance and compactness of ordinary gold, the very friable metallic ribbon is gently transferred from the *parting glass* to a crucible by inverting the former into the latter; and the liquid which runs in with the gold being poured off, the crucible and its contents are raised to a red heat in a furnace, when the gold recovers its beautiful yellow colour and metallic lustre, and at the same time becomes soft and flexible. The gold is now pure, and in a fit condition to be weighed, and the amount obtained indicates the proportion of pure gold in the original alloy. As the quantity of silver which is required to be present during this process, in order that the *parting* by nitric acid may readily take place, is three parts of silver to one of gold, it is customary to call this department of a gold A. *quartation* or *inquantation*.

During the A. of silver or of gold, it is necessary to guard against any sudden increase or decrease in temperature. Independently of the probable loss of metal through the fracture of the cupels, it is found that when the final buttons of pure metal are obtained on the red hot cupel, if great care be not taken to cool the whole very slowly, the bead of gold or silver *spits*, and little portions are thrown off.

The mode of assaying gold now described cannot always be followed out in the examination of jewellery and other manufactured articles, as, though only a few grains are required for the A., yet the removal of such might entail the destruction of the article, and in such circumstances the *touchstone* is resorted to. This stone was originally brought from Lydia in Asia Minor, and consisted of a coarse-grained quartz saturated with bituminous matter, but black basalt and other stones are now employed for the same purpose. The manner of using the stone is to draw a streak upon it with the auriferous article; and from the colour of the streak the richness of the gold can be very accurately determined by the practised

assayer. The subsequent action of nitric acid on the golden streak serves still further as a means of determining the purity of the metal, as the acid readily dissolves the copper and silver, and leaves the gold.

ASSA'YE, a village in the territory of the Nizam, lat. 20° 18' N., and long. 75° 55' E. It stands in the doab, or fork, of the Juah and Kaitna. A. claims notice chiefly as the scene of the first great victory of the Duke of Wellington, then Major-general Wellesley, won on the 23d September 1803. The British troops in action were only about 4500, while the Mahrattas under Scindia and the rajah of Berar numbered 50,000, of whom 10,000 were commanded by French officers. 98 pieces of cannon, 7 standards, all the baggage, and a large part of the ammunition of the Mahrattas fell into the hands of the conquerors, whose military supremacy was soon acknowledged over a great portion of India. In 1851 a medal was struck in commemoration of the victory.

ASSEERGHU'R, a fort situated on an isolated mountain at the north-east angle of the presidency of Bombay, in lat. 21° 26' N., and long. 76° 26' E. Its elevation above the base of the mountain is estimated at 750 feet. Its extreme length and breadth are respectively 1100 and 600 yards; from the irregularity, however, of the outline, the area is computed at not more than 300,000 square yards, or somewhat less than $\frac{1}{10}$ th of a square mile. With the exception of two avenues of ascent, both of them difficult and strongly fortified, the space is everywhere terminated by a carefully scarped precipice, varying in height from 80 to 100 feet. This formidable fastness has been twice taken by the British—first in 1803, and finally in 1819.

ASSEMBLY (*assemblée*), in the conduct of an army, is the second beating of the drum before a march, at which the soldiers strike their tents if encamped, roll them up, and stand to arms.

ASSEMBLY, GENERAL, in Scotland, Ireland, and the United States, denotes the highest court of the Presbyterian Church. It differs from the Anglican Convocation at once in its constitution and in its powers, representing as it does both the lay and the clerical elements in the church, and possessing supreme legislative and judicial authority in all matters purely ecclesiastical. The General A. of the Established Church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the general A. of the Established Church, and each of the Scottish universities sends a representative. The Assembly meets once a year in the middle of May, at Edinburgh, and sits for ten days. Its deliberations are presided over by a Moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times, this office was sometimes filled by laymen: among others, in 1567, by George Buchanan. In modern times, the moderator is always a clergyman. 84 presbyteries, composing 16 synods, return members to the General A. of the Established Church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the A. beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a deputy clerk, both clergymen, a procurator, and an agent. All business not despatched during the session of the A. is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the A., and again quarterly. The General A. of the Free Church of Scotland, which has 16 synods

comprising 71 presbyteries, and of the Irish Presbyterian Church, are similarly constituted, the principal point of difference being the absence of the royal commissioner. See PRESBYTERY, SYNOD, BARRICK, ACT, &c.

ASSEMBLY, NATIONAL (France). The States-general (q. v.), convoked by Louis XVI. of France, and opened May 5, 1789, consisted of the two privileged orders, clergy and nobles, and of the tiers état or commons. The privileged orders refusing to join the third estate and deliberate in a common chamber, the latter, of its own authority, June 17, assumed the title of *Assemblée Nationale*, and the right to act in the name of France. The court attempted to annul this resolution in a royal sitting, June 23; but the deputies of the third estate, along with the liberal members of the other two orders, had bound themselves by oath not to separate until they had given France a constitution, and had declared every attempt at violence on the part of the court, treason. They refused to quit the common hall, and the court yielded and commanded the nobles and clergy to join the National A. This was the beginning of the revolution, and the A. proceeded with astounding rapidity to metamorphose old France. The abolition of all privileges on the 4th August was followed by that of hereditary jurisdiction, and of restraints on religion and the press, and by the declaration of the Rights of Man (q. v.). In February 1790, the monastic orders were suppressed, and all remnants of feudalism swept away; in March, *lettres de cachet* and the oppressive salt-tax were abolished; in June, all orders and titles of nobility. In July, non-catholics had the property confiscated from their ancestors restored; Jews were relieved from personal taxation; and game-laws done away. A decree of October 18 abolished the cruel criminal penalties of Louis XIV. In January 1791 all corporations and guilds were abolished, and free-trade introduced. In February, political rights were conceded to Quakers; in May, the customs at city gates were abolished; in June, the torture; the violation of the secrecy of letters was also declared criminal. In September, all citizens, of whatever colour or religion, received political rights.

The principles on which the Assembly proceeded were the sovereignty of the people, the independence of the communes, the limitation of the royal power through a conditional Veto (q. v.), the separation of the political authorities, and the responsibility of ministers. Accordingly, the A., shortly after it was constituted, declared that to it alone, subject to the royal veto, belonged the legislative power. Several decrees, in September 1789, determined that the legislative body should form only one chamber, and should be renewed every two years; other decrees declared the king inviolable, and the throne inalienable. A decree of 7th November forbade the deputies to undertake the place of ministers; in December, the new organisation of the communes was begun. January 1790, France was divided into departments; in April, trial by jury was introduced; in May, it was declared that the right of war and peace belonged to the nation alone, that is, to the A.

In regard to finance, which had been the immediate cause of the Assembly's being convoked, the reforms were equally thorough. It was decreed at the outset that taxes were to be apportioned and raised without regard to rank or person. Then followed the approval of a loan of 80 millions of francs. A decree of November 1789 ordered the publication of the public accounts; another in December established a national bank. In March 1790 appeared the first law sanctioning the sale of 400 millions worth of the national domains; and in April, another ordering the issue of *assignats* (q. v.) on the

national property; in October, these assignats were declared to bear no interest. These measures were followed in the beginning of 1791, by a series of laws regarding coining, taxation, encouragement to industry, revenue-management, &c. A committee of the A. appointed to reform church matters, made a complete overturn of the old ecclesiastical system. After a declaration that Catholicism had ceased to be the state religion, tithes were abolished, and church property confiscated. Church ornaments and valuables were appropriated as patriotic gifts to the state; the civil jurisdiction of the bishops was taken away, and monks and nuns were freed from their vows. The clergy were put under a civil constitution. Each department was a see, and the communes ruled and paid bishop and curés. All the clergy were amenable to the civil courts, without appeal to the pope or the interference of any ecclesiastical authority whatever. Every clergyman had to take an oath accepting this constitution, which led to the emigration of a number, and subsequently to enactments of excessive rigour against refractory priests (*prêtres insermentés*).

The A. having thus laid the revolution on a foundation of 3250 decrees, and having sworn to the new constitution, and got it accepted by the king, closed its sittings, September 30, 1791. From its having framed the constitution (which lasted only 12 months), this assembly is usually called the Constituent A. It made way for the LEGISLATIVE ASSEMBLY, which was to reform the civil and criminal laws in accordance with the spirit of the new constitution. A decree had provided that no member of the Constituent should be returned to the Legislative A. But the democratic party received such preponderance at the elections, that the A. forgot its mission from the very first, and commenced a war with the remnants of the royal authority, which ended, August 10, 1792, with the overthrow of the throne and the suspension of the king. The constitution had provided for an appeal to the nation in extreme cases, and the Legislative A. now exercised that right by convoking a *National Convention* (q. v.), which, being invested with the powers of the sovereign, was to decide on the fate of the monarchy, and remodel the whole political system.

The title of National A. has been assumed by various other parliamentary bodies, originating in popular commotions, and aiming at radical political changes; as the French A. that met after the revolution of February 1848, and organised the republic, and which was likewise followed, April 1849, by a Legislative A. (see FRANCE); the German National A. at Frankfurt (see GERMANY); and the Prussian National A.

ASSEMBLY OF DIVINES, or WESTMINSTER ASSEMBLY, a celebrated convocation appointed by the Long Parliament for settling the doctrine, liturgy, and government of the Church of England. It consisted of 121 clergymen and 30 laymen—10 of whom were lords and 20 commoners—together with 4 clerical and 2 lay commissioners from the Church of Scotland. Among the more distinguished of the divines were Usher, Saunderson, Reynolds, Brownrigg, Ward, Twisse, Lightfoot, Gataker, Burges, Goodwin, Calamy, and Nye; of the laymen, Selden, Prideaux, the two Vanes, Rouse, Pym, Whitelocke, St. John, and Maynard. The Scottish divines were Henderson, Gillespie, Ruthford, and Baillie. 25 of those whose names were contained in the ordinance calling the Assembly, which was dated 12th June 1643, never appeared at the discussions, one or two of them having died about the time of the first meeting, and the others fearing the displeasure of the king. To supply the place of these absentees, 21 additional members,

called the superadded divines, were summoned to attend. This notable Assembly held its first meeting on the first of July 1643, and continued to sit till the 22d February 1649, during which time it had met 1163 times. Its most important work was concluded long before that time. One of the first things it did was to give its sanction to the *Solemn League and Covenant*, against which Dr. Burges alone stood out for several days. The Presbyterians formed a large majority in the Assembly, and exercised a corresponding influence on its decisions. In doctrine, the members were almost unanimous; but on the subject of church government, opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal fruits of its deliberations were the *Directory of Public Worship*, submitted to parliament April 20, 1644; the *Confession of Faith*, October and November 1646; the *Shorter Catechism*, November 5, 1647; and the *Larger Catechism*, September 15, 1648. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorised standards of the Presbyterian churches of Scotland, Ireland, and England. The *Directory of Public Worship* was ratified by both Houses of parliament, October 2, 1644, and the doctrinal part of the *Confession of Faith* in March 1648. An order of the House of Commons, October 13, 1647, ordained that the Presbyterian form of church government should be tried for a year, but no further legislation followed. What has hitherto been known as to the details of the proceedings of this remarkable convocation, has been derived chiefly from the *Letters of Baillie*, and Lightfoot's *Journal*, no complete account being known to exist; but the minutes of its meetings, or great part of them, are reported to have been discovered quite recently. See Hetherington's *History of the Westminster Assembly* (1843).

ASSENT, ROYAL, is the regal act by which the sanction of the crown to bills which have passed through both Houses of parliament is given. See ROYAL ASSENT.

ASSER, JOHN, the learned and congenial biographer of Alfred, was a monk of St. Davids, from the Latin name of which, *Menevia*, he is termed in the old records *Asserius Menevensis*. About the year 880, his reputation for learning and piety procured him an invitation to the court of Alfred, where he resided at intervals during the rest of the king's life, assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have been every way worthy. The king promoted him to various dignities, and finally made him Bishop of Sherburn. The *Saxon Chronicle* fixes the date of his death to the year 910. Several works have, with more or less authority, been attributed to A. The only one undoubtedly his, by which we can now judge of him as a man and a writer, is his *Annales Rerum Gestarum Aelfredi Magni*. This simple and most interesting narrative was first published in 1574 by Archbishop Parker. Its trustworthiness has recently (1842) been questioned by Mr. Thomas Wright, in the article 'Asser' of his *Biographia Britannica Litteraria*. This gentleman has assuredly made the most of the objections to its reliability that can be legitimately urged. Lingard and Dr. Pauli have replied to these, and, at present, the general impression of scholars of Anglo-Saxon literature is that there is no good reason for doubting its general accuracy and fidelity. The best edition is that of Wise (Oxf. 8vo. 1722).

ASSES, FEAST OF. See FOOLS, FEAST OF.

ASSESSED TAXES. These are duties assessed and charged upon the people, under the authority of numerous acts of parliament, beginning with the 43 Geo. III. c. 99. The duties now comprised under this branch of taxation are those on inhabited houses, male-servants, carriages, horses, and mules, dogs, horse-dealers, hair-powder, armorial bearings, and game. The duty on inhabited houses was substituted, by the 14 and 15 Vict. c. 86, for a former tax on windows. The A. T. are under the management of the Commissioners of Inland Revenue. See TAXES.

ASSESSORS may be defined as persons who are sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They are called *A.*, because, according to the Latin derivation and literal meaning of the word, they sit *side by side* with others. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. *A.* are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the 5 and 6 William IV. c. 76, commonly called the Municipal Corporation Act, it is, by section 37, enacted that the burgesses shall annually elect from among those qualified to be counsellors, two auditors and two *A.*, the former to audit the accounts of the burgh, and the latter to revise the Burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who, in fact, holds courts for the bishop. But in the case of a complaint against a clergyman for any ecclesiastical offence under the Church Discipline Act (the 3 and 4 Vict. c. 86), the bishop is directed to inquire into the matter, assisted by three *A.*, of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a serjeant at law, or an advocate who has practised five years in the court of the archbishop of the province, or a barrister of seven years' standing, another.

The judges of the common law courts, and the Queen's counsel, being serjeants, are, as a condition of their offices, *A.* of the House of Lords, advising the House on points of law which may be propounded to them by their lordships.

ASSETS. This is one of those terms in the law of England which in itself bears evidence of a Norman origin. It is derived from the French word *assez*, or more exactly, in Norman-French, *assetz*, 'enough' or 'sufficient,' signifying the property of a deceased person, which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptance, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

A. are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including all real estate, whether devised or descending to the heir at law. In connection with this distinction, *A.* are also said to be *A. by descent*, and *A. in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—*A.* in hand, again, signifying such property as a person leaves to his executors sufficient for the

clearing of burdens and bequests affecting his personal estate. *A.* are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole *A.* which have come to his hands, by the payment of debts in due order, he be afterwards sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plea administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other *A.* that shall come to the defendants, which is called a judgment of *A. in futuro*.

A. is not a technical term in Scotland, but it is nevertheless much used in the legal business of that country.

ASSIDIANS. See CHASIDIM.

ASSIENTO, i. e., treaty, a word specially applied to a compact between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. It was Charles I. of Spain who first concluded an *A.* with the Flemings. Next, a similar compact was entered into with the Genoese (1580 A.D.), the Portuguese (1636), and on the accession of Philip V. to the Spanish throne in 1702, with the French Guinea Company, which from that time took the name of *A. Company*, upon the understanding that for ten years it should have the exclusive right of annually importing 4800 negroes of both sexes to the continent and islands of Spanish America. The *A.* was next transferred to England at the peace of Utrecht in 1713, and made over by government to the South Sea Company for 30 years, permission being also granted to the company to send yearly, during the term of contract, a ship, carrying 500 tons of goods, to these Spanish colonies. The misunderstandings that grew out of this last clause contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them at the Madrid Convention of 1750, upon the payment of £100,000, and the concession of certain commercial advantages.

ASSIGN, To, in Law, signifies to transfer or grant over to a third party a security, a right of credit, or other right, whether in possession or in reversion, granted by a party indebted or under obligation to the party assigning. The words of assignment are to *A.*, *transfer*, and *set over*, and they operate to transfer both real and personal property. A *chose en action* (q. v.), contrary to the ancient principle, can now be assigned in England indirectly by the common law, and directly according to the recognised principles of the courts of equity. Besides this general application of the word, as a technical term in conveyancing, both in England and Scotland, it is also employed in England, in judicial procedure, where the decision of an inferior court is brought under review, and in proceedings in bankruptcy. See ASSIGNMENT, ASSIGNATION, ASSIGNMENT OF ERROR, BANKRUPTCY.

ASSIGNATION is a legal term in Scotch conveyancing, analogous to the English word Assignment (q. v.), by means of which the holder of any right, or the creditor in any obligation, or the proprietor of any subject not properly feudal (see FEUDAL SYSTEM), transfers his right or estate to a third

party. The party making the A. is called the *cedent*, and the party in whose favour the A. is made is called the *assignee* or *cessionary*, and the act of assignment thus made is irrevocable, an element in the deed which has been traced to the practice of the French law, a source from which the Scotch lawyers of the 16th c. borrowed so much—the Court of Session itself being a mere copy of the Parliament of Paris. A direct conveyance of a debt in France was termed *un transport*; the granter, *cédant*; and the grantee, *cessionnaire*; and these terms, derived from a Latin origin, were introduced into the Scotch law; and hence the names of the parties to an A., as we have stated. Unlike the English common-law view of the assignment, the Scotch A. has the effect of investing the assignee with the whole right which was in the cedent, although, according to the ancient practice, the A. gave, not simply the sum or subject assigned, but also the deed or written evidence of the right or thing assigned, a form arising from the circumstance of the instrument having been regarded as of the nature of a mandate or power of attorney to the assignee to make his claim and to act as in right of the cedent. In modern practice, however, it is usual to employ simply the terms 'assign, convey, and make over,' which correspond with the real character of the deed. In order, however, to complete the A., it must be *intimated* to the common debtor—that is, the party originally indebted to the cedent—and so essential is this intimation, that in the case of competing claims against the right interest or estate assigned, the A. first intimated will be preferred to one prior in date, but posterior in the date of intimation. Such intimation ought to be made by a *Notary Public* (q. v.), but other formal

notice of the A. is sometimes admitted. But there are certain assignments which require no intimation, such as the endorsement of bills of exchange, adjudication (q. v.), which is a judicial A., and marriage, which is a legal A.; and the same is the rule with regard to all right and estate assigned under the operation of the bankruptcy laws. In Scotch agricultural leases, assignees are generally excluded expressly.

But although A. is the strict Scotch term for assignment, the latter is in Scotland the technical term for the transference of certain property, such as property in copyrights, patents, and registered vessels.

A'SSIGNATS. After appropriating to national purposes the land belonging to the church, the French National Assembly (see **ASSEMBLY, NATIONAL**), instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land *assigned* to the holder. This paper money consisted chiefly of notes for 100 francs (£4) each, though many of them were for sums as low as ten or five francs, and even lower; and the first issue amounted to 400 million francs. The first A., which were issued in the spring of the year 1790, bore interest; but subsequent issues did not. The facility of this plan of providing government income led to its being repeatedly had recourse to, as the property of wealthy emigrants—persons who abandoned their country in alarm—fell into the hands of the rulers, and was confiscated, till the amount rose to the enormous sum of 45,578 million francs, besides a great number of forged A. manufactured

Fac-simile of Assignat.

abroad, and smuggled into the kingdom. The value of the A. naturally soon began to decline, and confidence once gone, the declension became fearful. In June 1793, one franc in silver was worth three francs in paper; in August, it was worth six. The State took the most extreme measures to compel the acceptance of A. at their full nominal value. The effects of these were to cause the A. to flow back into the public treasury, to raise the prices of all commodities, and to make every one averse to have any dealings with the State. One of these

consequences was attempted to be met by fixing a maximum of prices. But no one could compel producers and dealers to produce and sell at a loss; so that all business became disorganised. At last the value of A. came almost to nothing. Millions of individuals had suffered incalculable loss, and only a few who had bought public lands with the A. that cost them little or nothing, had enriched themselves at the expense of the community. In March 1796, a louis d'or (24 francs) brought 7200 francs in A. After this, they were withdrawn from the currency

in 1796, and redeemed, at $\frac{1}{60}$ th of their nominal value, by *mandats*, a new kind of paper money, which enabled the holder at once to take possession of public lands at the estimated value, while A. could only be offered at a sale. The *mandats* also soon fell to a seventieth of their nominal value, and were returned to Government in payment of taxes or of land.

At length, in July 1796, the system of paper-credit, so obstinately persisted in by government and so disastrous in its results to the public, came to an end. A law was passed declaring that every one was entitled to transact business in whatever circulating medium he pleased; that the *mandats* should be taken at their current value; and that the taxes be received either in coin or *mandats* at that rate. The A. were executed on a coarse kind of paper, and, as will be seen by the accompanying fac-simile, the devices were so meagre as to be easily counterfeited.

ASSIGNEE' IN BANKRUPTCY. See **BANKRUPTCY**.

ASSIGNMENT, in the law of England, is the name given to a conveyance by which the party making the A. transfers or grants over, for a sufficient consideration, a right in expectancy, in reversion, or other right not in possession, such as a bond, a debt, or other *chose en action* (q. v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose en action* by A.; and now the proceeding is in constant practice, the courts of equity, making the rule itself give way to the expediency of facilitating the transfer of property, having directly sanctioned the practice; and even in the courts of common law the application of the ancient principle is evaded. Mortgages may be assigned; indeed the right to make such a transfer is one of the properties of a mortgage security. A. is also the proper mode of assurance or conveyance for passing leasehold estates for years, and other chattel property; and by the 8 and 9 Vict. c. 106, s. 3, it is enacted, that all assignments made after the 1st of October 1845, not being an interest which before the passing of the act might have been created without writing, shall be void at law, unless made by deed. But a mere note in writing, if duly signed by the parties, will nevertheless be supported in equity as an agreement, and pass an equitable interest to the assignee. It also appears that a parol or verbal lease for a term not exceeding three years, and valid as such within the Statute of Frauds (q. v.), may be assigned by a simple note in writing, if impressed with a proper stamp. Copyright is assignable; indeed, by the 5 and 6 Vict. c. 45, s. 3, copyright is expressly given to the author *and his assigns*; but it is not required, like a patent right, to be in every case under the seal of the proprietor, it being enacted by section 13 of the same act that an A. properly entered in the book of registry at Stationers' Hall shall be as effectual as if made by deed.

In regard to the right of A. generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect of the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane

persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, is in general under an absolute incapacity to make any transfer of things personal; for, with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she may have possessed at the time of marriage, or subsequently acquired, belong, by the general rule of law, to her husband. There are also some few cases where, in respect to the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an officer of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See *Stephen's Commentaries*, vol. ii. p. 43.

An A. of goods and chattels is frequently made by a Bill of Sale (q. v.) Bills of Exchange (q. v.) and Promissory Notes (q. v.) are assigned by endorsement.

The corresponding term in the Scotch law is *Assignment* (q. v.). But in that system, A. is the legal and technical word for the transference of property, in copyrights, patents, and registered vessels.

ASSIGNMENT OF ERROR is the technical statement of certain grounds on which the judgment of a court of law is sought to be reviewed by a higher tribunal; but by the Common Law Procedure Act (15 and 16 Vict. c. 56., s. 152), it is now limited to the case where the defendant in error intends to rely in support of the judgment on the proceeding in error being barred by lapse of time, or by release of error, or other like matter of fact. See **APPEAL** and **ERROR**.

ASSIGNS, or in Scotch law, **ASSIGNEES**, is the legal name given to parties in whose favour an assignment or assignation (q. v.) is made.

ASSIMILATION. See **NUTRITION**.

ASSINIBOIA, the district round Red River Settlement. It takes its name from the Assiniboine river, as the settlement itself does from the river into which the Assiniboine flows. See **RED RIVER SETTLEMENT**.

ASSINIBOYNE, a river in the Hudson's Bay Territory. Near lat. 50° N., and long. 96° W., it falls from the north-west into the Red River (q. v.), which discharges its waters into Lake Winnipeg.

ASSISI (*Assisium*), a town of Italy, in the Papal States, in the delegation of Perugia, is built upon a steep hill, in 43° 5' N. lat., and 12° 33' E. long. Pop. about 5000. It is surrounded by a wall flanked with towers, and overhung by a lofty citadel in ruins. It is the birthplace of St. Francis, who here founded the Convento Sacro, the first monastery of the Mendicant order that bears his name, a large and beautiful structure, and one of the earliest specimens of the Gothic style of architecture in Italy. The church and the galleries of the monastery contain fine paintings by Cimabue, Giotto, and other old masters. Besides the Convento Sacro, there are eleven other monasteries in A. Of these, the largest is the Portiuncula, which has a richly decorated church, with a cupola by Vignola. In the last century, this place was a great resort of pilgrims, visiting the tomb of the saint, of whom one hundred thousand are said to have been assembled here on one day.

A. occupies the site of the ancient Assisium, a municipal town of Umbria, and presents the remains of the forum, the baths, and the aqueducts of the days of the Romans. In the piazza, or square, there stands a beautiful portico of the ancient temple of Minerva, consisting of fluted Corinthian columns and a pediment. There are abundance of olive-trees, and some fine mineral springs in the vicinity. The town has given title to a bishop since 240 A. D. It has manufactures of needles and files.

ASSIZE. This word, literally signifying a 'sitting' or 'session,' is a term used in the principal European legal systems, and very much in the same sense, or rather senses in all, for it has more than one distinctive meaning. As is common with regard to most of our ancient legal technicality, the Latin language, in the first instance (*assideo*), and then the French (*assis*), appear to have led to its introduction into the phraseology of the law of England, and, it may be added, also of Scotland, although in the latter country it has a more limited application in judicial procedure than in England, A. being in Scotland the old technical expression for a jury. In England, this word may also signify a jury, and it is sometimes used to denote an ordinance, decree, or law. But in modern practice, it is commonly applied to the sessions or sittings of the judges of the superior law-courts, held periodically in each county, for the purpose of administering civil and criminal justice. These courts came into use in room of ancient justices in eyre, *justicia rei in itinere*. They are now appointed by commissions issued to all the judges of the courts of common law, and to other learned persons, such as serjeants and barristers of suitable rank; and such commissions are accompanied by writs of *association*, whereby certain persons (usually the clerk of A. and his subordinate officers) are directed to associate themselves with the justices and serjeants, and they are required to admit the said persons into their society, in order to take the assizes, &c., that a sufficient supply of commissioners may never be wanting. But, to prevent the delay of justice by the absence of any of them, there is also issued, of course, a writ of *Si non omnes*, directing that, if all cannot be present, any two of them (a justice or serjeant being one) may proceed to execute the commission. These commissioners or judges of A. are sent twice in every year on *circuits* all round the kingdom, to try by a jury of the respective counties the truth of such matters of fact as are then under dispute in the courts of Westminster Hall; and occasionally a third circuit is appointed in the course of the year for the purpose of jail delivery. The circuits are eight in number—such as the Home, the Midland, the Norfolk, the Oxford, the Northern, the Western, the North Wales, and the South Wales circuit; and in going them, the judges or commissioners sit by virtue of four several authorities: 1. The commission of the *peace*; 2. A commission of *oyer and terminer*; 3. A commission of general *jail delivery*. The other authority is, 4. That of *nisi prius*, which is a consequence of the ancient commission of A. being annexed to the office of justices of A. by the statute of Westminster the second (13 Edw. I. c. 30); and it empowers them to try all questions of fact issuing out of the courts at Westminster that are then ripe for trial by jury. These, by the ancient course of the courts, were usually appointed to be tried at Westminster in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arose; but with this proviso, *nisi prius*, unless before the day prefixed the judges of A. should come into the county in question, which in modern times they have invariably done in the vacations preceding; so that the trial has always, in fact, taken place before

those judges. And now, by the effect of the statute 15 and 16 Vict. c. 76 (the Common Law Procedure Act, 1852), the course of proceeding is no longer even ostensibly connected with a proviso at *nisi prius*, but the trial is allowed to take place without the use of any such words in the process of the court, and as a matter of course, before the judges sent under commission into the several counties. The circuit system, however, does not extend to London and Middlesex, which have instead courts of *nisi prius*, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster Sittings—the times for which sittings are now regulated by the Common Law Procedure Act of 1854 (17 and 18 Vict. c. 125, s. 2); and the establishment of the Central Criminal Court (by the 4 and 5 Will. IV. c. 36, the jurisdiction of which has been recently extended by the 19 and 20 Vict. c. 16), has sufficiently provided for the administration of criminal justice within these districts.

The circuit courts of Justiciary in Scotland, of which there are three—the North, the West, and the South—very much resemble the assizes in England, and have, in criminal matters at least, very much the same jurisdiction; but in civil causes their authority is very limited.

In the sense of an ordinance or law, the term A. has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the 'Assizes' of Jerusalem were, as we are told in Gibbon's *Decline and Fall* (vol. xi. p. 93), a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were the 'Assizes,' or ordinances regulating the price of bread, ale, fuel, and other common necessities of life, but all of which have been abolished. The same regulations appear to have prevailed in Scotland in ancient times. See JURY, TRIAL BY JURY, MARKETS.

ASSOCIATE SYNOD, ASSOCIATE PRESBYTERY, &c., designations adopted among the SECESSIONS (q. v.) from the Church of Scotland. There is also an Associate Synod in America, and an Associate Reformed Church, both of which have sprung from the Scottish Secession.

ASSOCIATION. See CO-OPERATION; also, SOCIETY, LEAGUE, COMPANY.

ASSOCIATION OF IDEAS. This is a phrase of great importance in the Philosophy of the Human Mind, as expressing the most pervading fact at the foundation of our intelligence. By giving, therefore, a somewhat full exposition of this subject, we are able to explain, at once, a considerable number of the complex phenomena of mind in a more satisfactory way than by treating the several phenomena separately. What is meant by Association of Ideas, is familiarly illustrated by such occurrences as the following: When we see the sky becoming overcast, we think of rain as about to follow, the notion of rain not having previously been present to our mind. When we hear the church bells, we are apt to think of the crowds in the street, or of some of the other circumstances of public worship. When we pass a house, we are reminded of its occupier; and meeting a person we know, we may be carried in thought to his office, and from that to other persons holding the same office, and so on. If an object is before my eyes, as a mountain, I am said to receive an impression or sensation of it, in consequence of the actual presence of the thing; but it is possible for me to remember the mountain, or to have an idea of it, when far away from the reality, in which case there must be some power in the mind itself, different

from the susceptibility to present objects, a power of retaining, reviving, or resuscitating those states at first inducted by contact with the actual. Besides the sights, and sounds, and touches caused by contact with real things, we are greatly occupied with sights, sounds, and touches remembered, anticipated, or imagined, which is to live in a world of ideas; and it is in this world that the process termed Association has its sphere. When an idea is brought before the mind without its original, as when I picture to my mind the late Duke of Wellington, the circumstance is owing to the mention of his name, or of some incident connected with him; and my remembrance of his personal appearance, as I have seen him when alive, is said to be the result of an association existing in my mind between two ideas, so that the one is able to recall or restore the other. The association between names and things comprehends one of the most extensive applications of the power in question.

The circumstances under which one idea brings forward another into the view are principally these two—viz., first, previous *proximity*; and second, *likeness*. The terms 'Contiguity' and 'Similarity' are used in Mental Philosophy to express them. The first is exemplified in the examples of association given above; for in most of those it will be found that the conjoined notions have been frequently in the view at the same time, in consequence of which they have, as it were, grown together, or become part of the same whole. Thus, we have often noticed the darkened sky followed by a shower; the two facts have occupied the attention simultaneously, and in virtue of some power belonging to our mental framework, they have cohered into an inseparable couple or aggregate in the mind. This is proximity, or contiguity. When one idea suggests another which was never in company with it before, it is generally through the force of some *likeness* between the two. I meet an old man in the street with a very peculiar face, which reminds me of the bust of Socrates. These two things had never accompanied one another in my mind before, and therefore it could not be the force of proximity that made the second to arise at the instigation of the first; but there was a certain amount of likeness or similarity between the old man's features and the features of Socrates, as represented to us in the bust; and it is a fact of our constitution, no less certain and no less important than the foregoing, that in cases where something now before the mind has a strong cast of resemblance to something formerly observed or conceived by us, but not at present thought of in any way, the present is apt to recall that past idea, whatever it may be. By the force of likeness, the traveller in new countries is constantly reminded of the scenes and objects familiar to him, and so is induced to draw comparisons between the one and the other. Identification and comparison both imply that things are brought together by virtue of their similarity, they not having been in company before. The principle of proximity operates most in Memory, Habit, and Routine; similarity has to do with invention and originality, and is essential to the processes of Reason and Imagination.

Law of Contiguity.—The principle of association by proximity is not confined to ideas. We must state it in a more comprehensive form, in order to comprise the full sphere of its application; for our mechanical habits are formed through the very same power of our constitution that enables us to recall or remember ideas. The taught movements of a soldier or of a skilled workman are connected together so firmly that one succeeds to another almost of its own accord. Everything of the nature of acquisition supposes a plastic property in the human

system, giving permanent coherence to acts that have been performed together.

The following is a general statement of the law under consideration:

Actions, Sensations, States of Feeling, and Ideas, occurring together, or in close succession, tend to grow together, or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to rise.

And first, as to association of Actions or voluntary movements. When we perform a train of movements without any further aid of the will than to commence the series, there must be a fixed connection between each and the one that follows, and this connection may be either instinctive or acquired. There are various cases of instinctive trains, such as the action of the heart, lungs, and intestines, and the movements of deglutition. When a morsel of food reaches the back part of the mouth, the muscles of the throat seize hold of it, and transmit it to the stomach, independent of our will. The connected movements in this case are provided for in the original structure of the nervous and muscular system. In walking, there is partly an instinctive tendency to alternate the limbs, and partly a confirming acquisition, the result of practice. But in those complicated operations that human beings are taught to execute in the various avocations of life, the associating principle is everything. The apparently simple and easy act of taking food is a complicated acquisition; in other words, an extensive group of associated movements. The seizing of the morsel is followed by the movement of the arm that carries it to the mouth; the mouth is opened simultaneously; after which follow the processes of biting and chewing; all of which take place with the certainty of a machine, and without effort or attention directed to them. These associations were originally built up by slow degrees. 'As a general rule it takes many repetitions to cement so firm a union between successive and simultaneous movements as is implied in the above instance.'

A good example of the association of movements is furnished in our acquirement of spoken language, as in committing to memory words, sayings, and passages of books. When a child has perfectly acquired the Lord's Prayer, the chain of association is so firmly knit that the articulation of the words 'Our Father' is followed irresistibly with those next succeeding, and so on to the end. The cohesion in this case is between the vocal movements corresponding to the enunciation of the words. Having gone many times through this one definite succession, the stream of nervous power, in some way that we cannot at present explain, acquires a tendency to fall into this one definite track, and in future to bring on the movements in the exact order that they have so frequently followed.

It is not merely actual movements that can be joined together in this way, but the *ideas* of movements; for a man, meditating in language, and not speaking out his thoughts, can consolidate his trains so as to remember them afterwards.

When we proceed to Sensations and the Ideas, or subsequent traces, of Sensations, and take along with these the variety of our movements with their ideas, we find an unlimited scope for the associating principle; and the consequences of its operation spread far and wide in the domains of our happiness, our knowledge, and our active capacity. It is only possible here to present a few illustrative examples.

In the various mechanical acquirements, which include the whole of special handicraft industry and skill, as well as the use of the bodily members in the more general actions of daily life, there may be traced the linkings of actions with actions, or

actions with sensations and ideas. The helmsman steering a ship associates in his mind each deviation of the needle from the proper point with the specific muscular exertion to be applied to the wheel to rectify the ship's direction. The workman fabricating in wood, metal, or stone, acquires a firm connection between each aspect of the material and the muscular power to be applied to bring it one step nearer the desired form. The power of copying anything we see, as in writing, drawing, moulding, &c., when completely mastered, is made up of associations between a visible appearance and the train of movements calculated to reproduce it. After practice, all this is done, as it is called, mechanically, or without those operations of considering, willing, and remembering directions, that are essential to the learner in a new art. The associations that grow up after a certain amount of practice, are in this case associations between movements and appearances to the eye, or sensations of sight. In the greater number of crafts, the eye is the guiding sense to the operator, but not in all. Sometimes the effect is vocal, as in performing music, and in making and tuning musical instruments, in speaking, &c. In other arts, the touch is the guiding sense, and in some, as in cookery, the taste and smell direct the operator. Each accomplished workman has in his mind many hundreds, not to say thousands, of couples or aggregates of definite movements with other movements and with sensations, contracted in the course of his apprenticeship to his calling.

If we inquire into the circumstances that favour and promote this extensive circle of acquisitions, we shall find several that may be named as of importance. In the first place, a *natural activity of temperament*, or an abundant flow of power to the active members, as shewn in a great and various mobility of the frame, is a good basis of bodily acquirements. When the force of the system runs feebly towards the muscular framework, being perhaps expended in other ways, as in the thinking powers, more time is requisite to attain difficult mechanical arts. Another important circumstance is the *acuteness or delicacy of the sense*, involved in the operation. A keen eye, sensitive to minute degrees of effect, is wanted in all the various occupations that turn on visible appearances; a good ear is indispensable to music and the arts of producing sounds; and so on. With a naturally dull sensibility to flavour, no man can easily become a good cook, or a taster of tea or wine. The third consideration is the *natural power of adhesive association* belonging to the individual character. Some minds have originally a more powerful adhesiveness than others, either for things generally, or for special departments. We see this when a number of boys come together at school, and in apprentices learning together. Some are always found taking the start of the rest in rapidity of acquirement; and although the reason may be found in some of the other circumstances now mentioned, yet observation shows that when everything else is allowed for, there remains natural differences in the rapidity with which the adhesive bond is cemented; some acquiring without effort what others take both time and labour to accomplish. The fourth principal circumstance is the *interest* taken in the work, or the degree to which it engages the feelings of the learner. This is a material consideration, accounting for the acquisitions made in matters that we have a strong taste for without our having a pre-eminence in those other points that constitute natural capacity. These four conditions apply more or less to acquisition generally.

A detailed exemplification of this great principle of our nature might be given through all the departments of the human intellect. The acquirements

of speech, as already said, contain a wide range of instances. The adhesion of language is partly in the vocal organs, partly in the ear, and partly in the eye, when we come to written and printed characters. The associations of names with things, with actions (as in obeying direction and command), and with other names (in acquiring foreign languages), are a gradual growth favoured by such conditions as the above. The acquirements in Science, Fine Art, and Business, and in everything that constitutes skill or knowledge, proceed upon this plastic property of the mind. It also enlarges the sphere of our pleasures and pains. There are connections established in the mind between our states of feeling and the things that have often accompanied them, so that the accompaniment shall have power to revive the feeling. It is thus that we contract affections, both benevolent and malevolent, towards persons and things, our friends, our home, our country, our property, our pursuits.

This power of stirring up dependent associations to an extent that may be almost called unlimited (although there are limitations), is peculiar to the animal organization. Nothing parallel to it occurs in the mineral or vegetable world. It is a property of mind alone, and has its seat in the nervous tissue. We know that growth or change is requisite to the progress of the adhesion; for it proceeds most rapidly in youth, health, and nutrition, and decays in old age, and during exhaustion and disease. And even to keep our acquisitions from fading away, it is requisite that they should be occasionally revived. A language acquired in early years may be utterly lost by disuse. Sustained practice seems particularly necessary in early education; children's acquisitions are very liable to disintegrate, if not kept up and confirmed by new additions.

Law of Similarity.—This may be expressed as follows:

Present Actions, Sensations, Thoughts, and Emotions tend to revive their *LIKE* among *previous impressions*.

If the mind worked only by the principle of contiguity, nothing would ever occur to us except in some connection already formed. But some explanation is necessary as to the precise relationship subsisting between the two distinct forces of mental resuscitation, in order to shew at once their distinctness and their connection. When the cohesive link between any two contiguous actions, sensations, or ideas, is confirmed by a new occurrence or repetition, it is perfectly obvious that the present impression must revive the sum-total of the past impressions, or reinstate the whole mental condition left on the occasion immediately preceding. Thus, if I am disciplining myself in the act of drawing a round figure with my hand, any present effort must recall the state of the muscular and nervous action, or the precise bent acquired at the end of the previous effort, while that effort had to restore the condition at the end of the one preceding, and so on. But this reinstatement of a former condition by a present act of the same kind is really and truly a case of the principle before us, or of like recalling like; and without such recall, the progressive adhesion of contiguous things would be impossible. It would appear, therefore, that similarity is tacitly assumed in the operation of contiguity, and is indispensable to the process by which our acquisitions are gradually built up. Why, then, do we set up the associating force of likeness, as something independent and distinct? To answer this question we must advert to the fact that in those cases where the same impression is deepened by every new repetition, the old and the new are not merely similar, they are *identical*, and the resuscitation takes place without fail, and

as a matter of course. But in going deeper into the explanation of the human intellect, we encounter many classes of similars, where there is not absolute identity, but the mixing up of a certain amount of *diversity* with the likeness actually existing. The botanist classing together all the plants of the same order, as, for example, the *Rosaceæ*, has to be struck with the occurrence of certain common characters—viz., the properties that distinguish the order—in the midst of great varieties in all other respects. It is important that he recognise these general marks, whether the plants be trees or shrubs, whether they be poisonous or wholesome, and under many other diversities. It is exceedingly important in science, in the business of life, and even in the creations of fine art, that the mind should take cognizance of likeness surrounded by unlikeness; which is the case that renders it necessary to characterise as distinct the associating force now under discussion. In the case of perfect identity between a present and a past impression, the past is recovered, and fused with the present, instantaneously and surely. So quick and certain is the process, that we lose sight of it altogether; we are scarcely made aware of the existence of an associating link of similarity under such circumstances. But when we pass from perfect to imperfect or partial identity, we are more readily led to perceive the existence of this link of attraction between similars, for we find that the restoration sometimes does not take place; cases occur where we fail to be struck with a similitude: the spark of resuscitation does not pass between the new impression and the old dormant one. Then it is that we recognise differences between different minds; one man tracing resemblance and making out identity better than another. Moreover, we can assign reasons connected with the culture of the individual, which partially explain superiority or inferiority in this important faculty; just as we have pointed out the conditions favourable to the rapid growth of the adhesive bond of proximity. The failure in reinstating an old impression by virtue of a present one like it, is solely ascribable to the want of perfect identity. When in some new presentation of an object, the old familiar form is muffled, obscured, distorted, disguised, or in any way altered, it is just a chance if we recognise it; the amount of likeness still remaining will have a tendency to revive the object, while the points of difference or unlikeness will operate against the revival, and tend to restore things of their own kindred. If we hear a musical air that we are accustomed to, the new impression revives the old as a matter of course; but if the air is played with complex harmonies and accompaniments which are strange to us, it is possible that the effect of these additions may be to check our recognition of the melody; the unlike circumstances may repel the reinstatement of the old experience more strongly than the remaining likeness attracts it. If our hold of the essential character of the melody is but feeble, and if we are stunned and confounded by the new accompaniments, there is every probability that we shall not be put upon the old mental track made by the same air; in other words, we shall not identify the performance.

A few examples may next be given, to shew the workings of this associating power, and the consequences thence arising. The intellectual operations known under the names Classification, Generalisation, Induction, and Deduction, all proceed upon the discovery of likeness among things lying wide asunder in space and time, and very often veiled by diversity. Thus, in order to include in one list all the species of the *rose*, botanists have had to trace the characters of the genus through its various members, wherever they occur, and under the greatest differences in

every other respect. It takes a keen identifying faculty—that is, a strong natural tendency for the resurrection of like to meet like—to see the resemblance of some of these species to the rest; and it has happened in many departments of knowledge that a class has remained incomplete for a time, purely from the disguised character of some of the individuals. So in the process termed *induction*, by which a general law is arrived at by comparing instances of it everywhere, there must be an attraction of similars, in order to bring together in the mind the collection of particulars that the induction is based upon. Thus, Newton assembled in his view the various transparent bodies that he had found in the course of his experiments to refract or bend light strongly, his only intellectual instrument for doing so being the bond of likeness operating as a power of recall. Having looked at them in company, he saw that some were remarkable for their weight or specific gravity, and others for containing inflammable ingredients; upon which he raised the general induction, connecting these two properties with high refrangibility. Then, *deductively*, he applied this generalisation to the diamond, which refracts light more than any other known substance; and as it is not a heavy material, he extended the other inference to it—namely, that it was made up of some inflammable material, an inference afterwards confirmed by the discovery that it is crystallised carbon. Many of the greatest discoveries in science have turned on the identification of modes of action never before supposed the same, as when Franklin was struck with the resemblance between the atmospheric thunder and lightning, and the phenomena of common electricity.

Another wide field for the operation of the same principle, is the region of *illustrative comparisons*, whereby two things widely remote are brought together, in the view either to elucidate one another, or for the sake of ornament and poetic effect. Most men of genius in literature and poetry have contributed original illustrations, similes, metaphors, or comparisons in the course of their compositions. Shakespeare carries the palm in this faculty. The writings of Bacon are remarkably rich in those that serve the purpose of exposition. Science is with him the 'interpretation' of nature: final causes are 'vestal virgins;' they have no fruit: fallacies are 'idols.' Edmund Burke, another master of illustrative comparison, has termed revolutions the 'medicine' of the state, and regular government its 'food.'

If we inquire into the circumstances that render one mind more prolific in new identifications and comparisons than another, apart from difference of original capacity, we must refer mainly to the fact, that the one has had the greater previous familiarity with the class of things thus brought up by the attraction of similarity. A mathematician is the most likely person to bring up comparisons from mathematics; a botanist is prepared to identify plants; a travelled man provides illustrations from foreign countries; a historian, from history. The sailor is notoriously rich in nautical similes and illustrations. When any one not specially versed in a subject is yet prone to draw upon it profusely in the way of comparison, we must then refer to great natural endowment as the sole explanation. But our space does not allow us to dwell further on the subject. (For the full exemplification of both the associating principles and of the complications that they give birth to, see Bain on *The Senses and the Intellect*.)

The earliest known attempt to lay down the laws whereby thought succeeds to thought, is that contained in Aristotle's treatise on Memory. He

enumerates three different principles of mental resuscitation—viz., Similarity, Contrariety, and Co-adjacency. He has been followed by most other philosophers as regards all the three principles. It is now, however, clearly seen and generally admitted, that contrariety is not an independent associating force. When a thing suggests its opposite or contrary, it will be found that the two have been previously together in the mind, and have therefore acquired a mutual hold by contiguity. Such, for example, is black and white, wet and dry, health and sickness, prosperity and adversity, &c. Contraries, in fact, have a natural inseparability; they are of the class of relatives like father and son, which imply each other, necessarily, and have no meaning except by mutual reference. It requires no new principle of our constitution to account for suggestion in this particular case. Moreover, when things are strongly contrasted with one another, as high position before a fall, the mind is greatly impressed with the shock of transition, and so retains a lively recollection of the sequence, having by that means a greater tendency to pass from the one to the other. Thus, then, the enumeration of Aristotle is reduced to the two principles that we have now expounded.

Hobbes recognised the principle of contiguity as the foundation of reminiscence; but the Aristotelian philosopher, Vives, who wrote in the 14th c., was the first to specify in minute detail the various circumstances that determine the adhesive bond of recollection. Hume's enumeration is well known to have comprised the three principles of resemblance, contiguity, and causation, which he illustrates as follows: 'A picture naturally leads our thoughts to the original, [resemblance]. The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others, [contiguity]. And if we think of a wound, we can scarce forbear reflecting on the pain which follows it, [causation].' Causation, however, is merely a case of contiguity; so also we may say of Order in Place, and Order in Time, which have been given as distinct principles.

An attempt has been made to generalise Similarity into Contiguity, but without success. For a full and critical view of the history of these laws, see Sir W. Hamilton's edition of Reid.

ASSOUAN, ESSUAN, or ESWAN, the ancient Syene, a town of Upper Egypt, on the east bank of the Nile, near the borders of Nubia, 110 miles south of Thebes, in lat. $24^{\circ} 5' 30''$ N., and long. $32^{\circ} 55'$ E. There are few remains existing of the ancient city. Some granite columns present themselves among the ruins, but do not seem of an early date; and part of a temple still remains with a dilapidated portico. Of the town-wall, that part which lies to the south of the old town is still standing; and beyond it is the cemetery of A., where there are numerous tombs, mostly cenotaphs, with Arabic inscriptions. In the neighbourhood there are several granite quarries, some of them remarkable for remains of ancient materials that had been cut from the rock, and partially hewn, and for antique inscriptions and tablets, announcing the removal of blocks and the reign of the Egyptian monarch by whose orders they had been quarried. The environs of A. are sterile and sandy; but the palm thrives, and the dates, which are excellent, form the staple of the trade. Some traffic is carried on in senna, henna, charcoal, wicker-baskets, and slaves.

The ancient name Syene is the Coptic word *souan* or *suan*, signifying 'opening'; and the modern one is formed by adding the Arabic *el*, 'the,' softened into *es*, viz., *Es-suan*, 'the opening.' A. and its vicinity are highly interesting to geologists and

mineralogists; that kind of granite called syenite receives its name from the town.

ASSUMPTION, a village and river of Lower Canada. About 8 miles below the village, the river flows into the St. Lawrence, or rather into the Ottawa, nearly opposite to the lower extremity of the island of Montreal.—A., or Asuncion, is also the name of the capital of Paraguay, on the left bank of the river of that name. It has a population of 8000, and has a trade in hides, tobacco, timber, wax, and Paraguay tea. The city was founded in 1535 by the Spanish, and soon became a place of importance, though not of beauty, being ill built, dirty, and disagreeable. The surrounding country is rich in pastures, and also produces crops of wheat, maize, sugar, tobacco, honey, wax, &c.

ASSUMPTION OF THE VIRGIN MARY. A festival of the Romish Church. In the 7th c., the idea originated that the soul and body of the Virgin had been carried up to heaven by Christ and his angels. The Roman Catholic Church, therefore, has, ever since that period, kept the 15th of August in memory of Mary's translation into glory; although, from the 4th c. until then, it had kept the same day in memory of her death. Liguori, in his *Glory of Mary*, gives a very minute account of the circumstances of her Assumption.

ASSURANCE. See INSURANCE.

ASSURANCE, COMMON, is described by Blackstone as the legal evidence of the translation of property, whereby every man's estate is assured to him, and all controversies, doubts, and difficulties are either prevented or removed. For an account of these common assurances or conveyances, as they are generally termed, see DEED and CONVEYANCE.

ASSYNT, a mountainous, moorish, and very rugged district or parish, 25 miles long, and 15 broad, in south-west Sutherlandshire. It mostly consists of a net-work of rocky heights, interspersed with a multitude (200) of dark, motionless tarns or pools, of various sizes, with some larger lochs, the largest, Loch Assynt, being 10 miles long and 1 broad. The district consists of gneiss, Silurian rocks, and primitive limestone. There are a dozen mountains 3000—3500 feet high. Some of the mountains are covered with white bleached stones and protruding rocks like patches of snow. The mountains have frequently the form of artificial pillars and cairns, and are the remains of an enormous denudation of the nearly horizontal strata of the district. Suil Veinn is a perfect sugar-loaf, towering nearly 2000 feet above a rugged table-land of gneiss hills, 800 to 1000 feet above the sea. In Advreck Castle, on a promontory on the east side of Loch A., the famous Marquis of Montrose was confined in 1650.

ASSYRIA (called Athura on Persian cuneiform inscriptions, and Assura on the Median) was the northernmost of the three great countries that occupied the Mesopotamian plain. It was bounded on the N. by the Niphates Mountains of Armenia; on the S. by Susiana and Babylonia; on the E. by Media; and on the W., according to some, by the Tigris, but more correctly by the water-shed of the Euphrates, for many Assyrian ruins are found to the west of the Tigris. It was thus about 280 miles long from north to south, and rather more than 150 broad from east to west. This plain is diversified by mountain-chains on the north and east, and watered by the Tigris and its affluents, between two of which—the Zab rivers—lay the finest part of the country, called Adiabene. As it was the boundary-land between the Semitic people and Iran, it became the scene of important political events. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity

and civilisation reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the many proofs—furnished by recent excavations—of an acquaintance with the arts and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekrit to Bagdad. Under the Mohammedans, this fine country is now almost a desert.

History.—Ancient authorities differ widely from each other respecting the rise and progress, the extent and the duration, of the Assyrian empire. Ctesias, a Greek of Cnidus, court-physician to Artaxerxes Mnemon, is quoted by various ancient writers; and his information, though utterly incredible and fabulous, has been followed by most classical historians and by the whole series of ecclesiastical writers. Many ingenious but futile attempts have been made to reconcile his history with the Scripture narrative. Berosus, a priest of Bel at Babylon, who wrote about 268 B.C., and Herodotus, differ widely from Ctesias, but are confirmed in many important particulars by the Bible, and by the continually increasing evidence derived from cuneiform inscriptions.

In the Bible narrative, we are told that Nineveh was founded by Asshur from Babylon (Gen. x. 11). The latter city, therefore, must have been the capital of a more ancient empire, as Berosus asserts, and recent discoveries go far to prove, though Greek writers maintain the reverse. The next notice we have of A. does not occur till 770 B.C., when Pul, king of A., invaded Palestine, but was bought off by Menahem, king of Israel. Tiglath-pileser, who succeeded Pul (738 B.C.), conquered Syria, and carried off many of the Jews into captivity. Next, Salman-ezer (730 B.C.), subdued Israel, which, at the instigation of the Egyptians, had refused to pay tribute. The next is Sennacherib (713 B.C.), who attacked Egypt, and threatened Judah under Hezekiah. He was slain by his two sons, and succeeded by his son Esarhaddon, who was also master of Babylon (2 Chron. xxxiii. 11), which, under Nabonassar, had been independent of Nineveh since 747. Very little credit is to be attached to the expedition of Holofernes recorded in the book of Judith.

After this, the empire appears to have gradually decayed, until at last, in the reign of Sardanapalus II., or Saracus, a league was formed for its destruction between Nabopolassar, governor of Babylon, and Cyaxares, king of Media, which was strengthened by the marriage of Nebuchadnezzar, son of the former, to Nitocris, daughter of the latter. The war and siege are said to have been interrupted by an invasion of the Scythians, which drew off Cyaxares; but at length Nineveh was taken and destroyed about 606 B.C., or, according to Rawlinson, 625. In the time of Darius Hystaspes, A. rebelled without success in conjunction with Media. In the time of Herodotus, the capital had ceased to exist; and when Xenophon passed it, the very name was forgot, though he testifies to the extent of the deserted city, and asserts the height of the ruined walls to be 150 feet. Probably in this height is included the elevation of the river-bank and of the mound on which the wall stood. An inconsiderable town seems to have existed on its ruins in the reign of Claudius; and the last notice we have of Nineveh in the Classics is in Tacitus.

According to the Greek legends, the Assyrian empire was founded by Ninus. To this monarch and his consort Semiramis are ascribed expeditions on an incredibly magnificent scale against Bactria, Ethiopia, and India. We are told that Semiramis

led an army of 3,000,000 infantry, 500,000 cavalry, and 100,000 chariots, and a fleet of 2000 ships, and was encountered by forces more numerous still, and defeated; that she returned to Nineveh, where she soon afterwards died, and was reckoned among the gods, and was succeeded by her son Ninuas, an effeminate prince. The succeeding part of the history as related by Ctesias is equally false, though that writer managed to make the ancient world give credit to his narrative in preference to that of Herodotus. He gives a list of monarchs from Ninus to Sardanapalus, which is now considered to be a clumsy forgery. According to him, for thirty generations after Ninuas, the kings led a life of luxury and indolence in their palace; the last of them, Sardanapalus, made a vigorous defence against Arbaces, the rebel governor of Media, but finding it impossible to defend Nineveh, he set fire to his palace, and burnt himself with all his treasures; this event took place 1306 years after Ninus. Now, the above account represents Nineveh to have perished nearly three centuries before the real date, which was about 605 B.C., and is utterly incompatible with Scripture. Herodotus assigns to the empire a duration of 520 years, and Berosus of 526. In order to reconcile these conflicting accounts, historians have supposed that Nineveh was twice destroyed, but this supposition is now generally rejected. However, that Nineveh was actually destroyed by fire, is proved from the condition of the slabs and statues found in its ruins, which shew the action of intense heat.

A. became a Median province, 605 B.C., and afterwards, in conjunction with Babylonia, formed one of the satrapies of the Persian empire. In 331 B.C., at Gaugamela, near Arbela, in A., Alexander defeated Darius Codomannus. In 312 B.C., A. became part of the kingdom of the Seleucidæ, whose capital was Seleucia, on the Tigris. It was afterwards subject to the Parthian kings, whose capital was Ctesiphon, and was more than once temporarily in possession of the Romans. When the Persian monarchy of the Sassanides was destroyed by the successors of Mohammed, A. was subject to the califs. Their seat was Bagdad from 762 A. D. till 1258. It has been under the Turks from 1638, at which period it was wrested from the Persians.

We shall now proceed to mention a few historical points that have been satisfactorily ascertained from the cuneiform inscriptions. For these we are indebted to Rawlinson's *Herodotus*.

It has not been ascertained when A. first became independent of Babylon (q. v.). The seat of government was first at Asshur (now *Kileh-Shergat*), on the right bank of the Tigris, 60 miles south of the later capital, Nineveh. At this place have been found the bricks and fragments of vases bearing the names of the earliest known Assyrian kings, for Ninus and Semiramis are to be considered as mere inventions of Greek writers. The earliest known king is *Bel-lush*, one of a series of four. These reigns probably occupy from 1273 to 1200 B. C. Of the next series of six, the names of five are recorded on the famous *Kileh-Shergat* cylinder, the earliest purely historical document as yet discovered in Mesopotamia. The fifth king of this series, Tiglath-pileser I., records on this cylinder his own annals, and traces back his ancestors thus: 'Tiglath-pileser, the illustrious prince, whom Asshur and Hercules have exalted to the utmost wishes of his heart, who has pursued after the enemies of Asshur, and has subjugated all the earth—the son of Asshur-rish-ili, the powerful king, the subduer of foreign countries, he who has reduced all the lands of the Magian world—the grandson of Mutaggil-nebu, whom Asshur the great lord aided according to the wishes

of his heart, and established in strength in the government of A.—the glorious offspring of Asshur-dapal-il, who held the sceptre of dominion, and ruled over the people of Bel, who in all the works of his hands and the deeds of his life placed his reliance on the great gods, and thus obtained a prosperous and long life—the beloved son of Nin-pala-kura, the king who first organised the country of A., &c.

Tiglath-nin, the last of the Kileh-Shergat series, was succeeded by his son, Asshur-dani-pal, the warlike Sardanapalus I. of the Greeks. He made Calah, the modern *Nimrud*, his capital, lying 40 miles further north, on the left bank of the Tigris. His annals are very complete. Among other conquests, he mentions that he had taken tribute from Tyre, Sidon, and other Phœnician cities. He was the founder of the north-west palace at Nimrud, which, next to that of Sennacherib at Koyunjik, is the largest and most magnificent of all the Assyrian edifices. The greater portion of the sculptures now in the British Museum are from this building. The palace of Solomon covered little more than one-tenth of the space occupied by this palace, and not one-thirtieth of that covered by the vast building of Sennacherib.

Sardanapalus I. was succeeded by his son Shalmanubar, whose deeds are briefly recorded on the black obelisk now in the British Museum, the full account being apparently reserved for the colossal bulls, which seem to have been the usual dedication after a victory. Of his campaigns, the most interesting to us are those in which he defeated Benhadad of Damascus, and his murderer and successor Hazael. According to his own account, Shalmanubar defeated Hazael, killing 16,000 of his fighting-men, and capturing more than 1100 chariots (884 B.C.). The obelisk also records the tribute paid by *Yahua, son of Khunri*, i. e., Jehu, son of Omri, king of Israel. Now Jehu was son of Jehoshaphat, and had done his utmost to extirpate the family of Omri; but probably Jehu, like other usurpers, was anxious to identify himself with the family which he had dispossessed, and of course the Assyrians accepted the title he gave himself.

Iva-lush, probably the Pul of the Scriptures, is recorded on a pavement-slab from Nimrud to have received tribute from Samaria, Tyre, Damascus, Idumæa, and Palestine, which assertion agrees with the account given (2 Kings xv.) of the 1000 talents paid by Menahem. With this king ends the first dynasty, in which we have 18 monarchs from Bel-lush to Iva-lush (1273—747 B.C.).

The later Assyrian empire begins with Tiglath-pileser II. (747), and ends with the destruction of Nineveh (625). It is plain from Scripture that the empire was in a flourishing condition during the reigns of those kings who came in contact with the Hebrews, and this account exactly accords with the monuments, but contradicts Herodotus. Probably, on the accession of Tiglath-pileser II., who, in his inscriptions, makes no mention of his ancestors, nor even of his father, and therefore may be considered a usurper, Babylon had revolted, and this partial rebellion had reached Herodotus in an exaggerated form. The annals of this prince exist only in a very fragmentary state. The name of his successor, Shalmaneser, has not yet been found on the monuments. The capture of Samaria is usually ascribed to this prince, but his successor, Sargon, expressly asserts that Samaria was taken by himself in his first year. Besides, in 2 Kings xvii. 6, the 'king of A.' is not necessarily the same monarch as the 'king of A.' in the preceding verse. It would appear, therefore, that Shalmaneser died, or was deposed, while Hoshea still held out. Sargon's palace at *Khorsabad*, near Nineveh, furnished the valuable series of monuments now in

the Louvre. Sargon was succeeded by his son Sennacherib. He fixed the seat of government at Nineveh, and employed the forced labour of 360,000 men to repair the great palace. Later in his reign, he built a new and more magnificent edifice, which he decorated with sculptures representing his various exploits. This is the palace excavated by Layard. It contained at least three spacious halls—one of them 150 feet by 125, and two long galleries, one of 200, the other of 185 feet, besides innumerable chambers. The excavated portion covers above eight acres. The annals of Sennacherib extend only to his eighth year. He relates at length his successful attack upon Babylon, his invasion of Judæa, the submission of Hezekiah, and his deportation of 200,000 Jews. This expedition is not to be confounded with the second invasion, in which he failed ignominiously, and which is not recorded on his monuments. His assassination very shortly after his return to Nineveh, after his second expedition, readily accounts for this silence.

Esarhaddon, his son and successor, held his court sometimes at Nineveh, sometimes at Babylon. Bricks bearing his name have been discovered at *Hillah*, and a tablet at Babylon dated in his reign. This explains how Manasseh was brought to him at Babylon, when he was led captive from Jerusalem (2 Chron. xxxiii.). No record has as yet been discovered of this expedition against Palestine. His edifices are not inferior to those of his predecessors. He employed Greek and Phœnician artists, and to them probably we owe the beautiful bas-reliefs that adorn the edifices of his erection. The decline of the empire probably commenced with Asshur-bani-pal II. The arts of peace flourished, while the military vigour of the nation declined. The sculptures of this reign are decidedly superior to the earlier in spirit, delicacy, and freedom from conventionality. The slabs shew that hunting, not war, was this king's favourite pursuit. He was succeeded by his son Asshur-emit-ili, the last king of whom any records have yet been discovered. It is uncertain whether Nineveh was destroyed under him, or under a successor, the Saracus of Berosus, the effeminate Sardanapalus of the Greeks. The character usually given of this last king, as a debauchee throwing off his indolent habits, and after performing prodigies of valour, perishing by a glorious death, rather than surrender, is derived solely from Ctesias. All we know distinctly is, that Saracus was betrayed by Nabopolassar, governor of Babylon, who made an alliance with Cyaxares the Mede, and cemented it by a marriage which has been alluded to before; that Saracus, despairing of success, fired his palace with his own hand, and perished with all belonging to him in the conflagration.

Government.—The government was despotic, as suited the character of the people. The empire was a mere congeries of kingdoms bound to the supreme authority only by certain obligations of paying tribute, giving presents, and shewing due respect. Each kingdom retained its own rulers, laws, and religion, although we do find some attempts to rule by satraps and collectors of tribute. Tiglath-pileser also boasts, in an inscription, of having punished and crucified the Chaldeans who refused to worship his gods. In consequence of this imperfect organisation, the empire was exposed to frequent revolts of the subject nations, when such opportunities offered as a disputed succession, or want of energy in the ruling prince. Then the labour of conquest had to begin anew, and it was sought to diminish the danger of the central power by inflicting severe punishments on the rebels. The history of the Jews has made us familiar with one of these devices—viz., the wholesale deportation of the inhabitants of the

offending district. It may be readily believed that such an empire, though imposing from the magnificence and wealth of the capital, yet, from the impoverishment and weakness of the subject states, was continually liable to fall to pieces, and was ill fitted to resist an attack from without. That A. did actually last for five centuries, was owing to a long succession of warlike princes, and to the energy of the population.

Religion.—The religion of the Assyrians was nearly identical with that of the Babylonians. It was a gross polytheism, their gods being thousands in number, and each village having its own particular deity. From thousands of theological tablets now in the British Museum, it is known that each divinity had many names, and some of them as many as fifty titles besides. Again, many deities that are prominent in the Babylonian pantheon are either unknown or occupy a subordinate position in the Assyrian. Besides, the same gods did not remain equally popular throughout. The supreme god was Asshur, probably the deified patriarch. His worship was confined to A. He is generally associated in the inscriptions with *Nin* and *Nergal* (2 Kings xvii. 30), who are represented by the man-bull and the man-lion. The winged globe, so often seen in the sculptures, from which a figure with a horned helmet shoots his arrows, is supposed to be the emblem of Asshur. Next in rank is the governing triad, answering to the Pluto, Jupiter, and Neptune of the classical mythology; the next group corresponds to *Æther*, the sun, and the moon; then five inferior deities, representing the five planets. Each god is associated with a goddess. *Mylitta*, or *Beltis*, is the 'queen.' The male and female powers of the sun are represented in the Scripture phrase, 'Adramelech and Anamelech, gods of Sepharvaim'—that is, of Sippara, a town a few miles above Babylon. *Bel-merodach* was originally an inferior deity, son of *Hea*, the fish-god; but under the later Babylonians, we find him monopolising the greater part of the homage which used previously to be divided among several. *Nebuchadnezzar* says: 'Merodach, the great lord, the senior of the gods, the most ancient, has given all nations and people to my care.' *Nisroch* (2 Kings xix. 37) has not been yet ascertained. *Nebo* (Isaiah xlv.) is one of the five planetary gods, and corresponds to Mercury. The systems of notation, divisions of time, the planets and stars, animals and metals, divination and astrology, were all more or less closely connected with theology.

Ethnology.—When we consider that Babylon was flourishing in all its splendour many centuries after its rival had ceased to exist; that it was a city of marvellous size, antiquity, and magnificence, enriched not only by the amazing fertility of its territory, but by its commerce with India and other countries; inhabited by a population remarkable for skill and taste in costly manufactures, and possessing a priestly caste, renowned as philosophers, astronomers, and magicians—we are not surprised that the curiosity and admiration of ancient writers were excited, and that numerous notices respecting Babylon, are found in them. On the other hand, the importance and dignity of A. as a country fell with its burning capital; and since that event happened long before classical historians had commenced to write, we can easily account for finding in them extremely little information respecting the character of its population. The Assyrians have been assigned by some ethnologists to the Aryan race, but it is now generally acknowledged that they were a branch of the Semitic family of nations, and therefore were members of the same grand division of the human race as the Syrians, the Phœnicians with their colonies, the Jews, and the modern Arabians. In the 20th

c. B.C., Semitism, as a distinct, ethnic element, appears to have first developed itself. The original races, variously called Scythic, Turanian or Tatar, appear to have once been spread over the whole space from the Caucasus to the Indian Ocean, and from the Mediterranean to the mouths of the Ganges. Their type of language has continued to our time to exist in four-fifths of Asia, and in some of the remoter corners of Europe, as among the Fins, Lapps, Turks, and Hungarians. In Mesopotamia, and in the valley of the Nile, where natural advantages induced men early to form settled communities, the rude and inartificial type of language was developed into Hamitism, and afterwards still further improved into Semitism. Then seems to have commenced a series of migrations. Asshur went forth probably at this time from Babylon to A., Abraham and his followers to Palestine, the Joktanian Arabs to Arabia. From these seats, Semitism was afterwards carried to Cyprus, to the southern seaboard countries of Asia Minor, to Carthage, Sicily, Spain, and Western Africa.

The Semitic family occupies a district of very small size compared with the space occupied by the Turanian and the Aryan or Indo-European. Semitism has had remarkable influence over mankind in the development of religious ideas, and by one Semitic people an enterprising and successful commerce was long carried on, and considerable conquests made. But if we except the rise of the Arabs in the 7th c. of our era, produced by religious excitement, we find that this race, though possessed of great passive vitality, has been unable to sustain an aggressive action for any length of time. The traditions of A. indicate a very early connection between Ethiopia, Arabia, and the cities on the Euphrates. Mesopotamia undoubtedly contained a large proportion of Arabians, and this accounts for the fact that Herodotus styles Sennacherib king of the Arabians and Assyrians. The Chaldeans, colonies of whom were planted in Armenia by the Assyrian kings, are supposed by some to have been a foreign tribe, which had immigrated from the north, and become a priestly caste. But the *Akkad* race, of which the Chaldean is a tribe, is with more probability thought to have inhabited Babylonia from the remotest times, and by it the earliest civilisation in Mesopotamia was originated. Probably the art of picture-writing was possessed by the Hamitic tribes who lived in the valley of the Nile, and passed eastward to the Euphrates. The *Akkad* language appears to have been formed before Semitism attained its peculiar development and organisation. Long after Semitism had become predominant in Mesopotamia, the *Akkad* or Chaldean alphabet continued to be the scientific language in which all the tablets relating to mythology, astronomy, or science, as well as most historical and official records, were written. This alphabet was adopted with certain modifications by the Semitic tribes, which became predominant in A. The cuneiform characters were elaborated from the forms of natural objects, and gradually became phonetic from being symbolic, and for convenience of engraving, assumed the form of arrow-heads, instead of the rounded and flowing forms which are introduced by the use of plastic materials. After the Aryan race had spread more extensively in Western Asia, the Persian monarchs, when they wished to make any communication to their subjects generally intelligible, found it necessary to publish it in three languages belonging to the principal divisions of human speech; hence the trilingual inscriptions of Behistun, &c., which consist of an Indo-European, a Tatar, and a Semitic column. It is still necessary in many places to employ three tongues, representatives

of the three families, the Persian, the Turkish, and the Arabic.

Antiquities, Civilisation, &c.—The excavations carried on by M. Botta, French consul at Mosul, and by Layard near Mosul, Khorsabad, and Koyunjik, have led, as we have partly seen, to very interesting discoveries. The palaces and buildings that have been laid open are full of sculptures, all covered with inscriptions, in deciphering which considerable progress has been made, and more may be expected. Among the most remarkable monuments now in the British Museum are two winged, human-headed lions, 12 feet high, and as many in length; winged human-headed bulls of similar dimensions with the lions; winged sphinxes; and the famous obelisk of black marble, sculptured on the four sides. On this last are represented a victory, a prisoner prostrate at the feet of the king, and foreign people offering tribute, and leading such animals as the Bactrian camel, elephant, lion, and rhinoceros—

Lion-hunt.

(From the North-west Palace at Nimrud.)

animals found only in lands far east of the Tigris. The bas-reliefs are very numerous, exhibiting especially war and hunting. The march, the onset, the pursuit, the siege, the passage of rivers, the submission and treatment of captives, secretaries noting the number of heads taken in battle, and the amount of spoil; the chase of the lion, of the antelope, of the wild ass, and other animals—such are the favourite subjects of the Assyrian sculptor. Nor are they treated in the conventional style of Egypt, but in a manner which, for grace, spirit, correctness and delicacy of execution, exceeds everything else known in Asiatic art. The artists sometimes follow modes of representation different from ours; for instance, a bull has five legs given him, in order that from all points of view he may be seen with four; a ladder stands edgewise against a wall, to show it is not a pole. But a truthful impression is always aimed at, and it is this that gives these sculptures their value. The labour bestowed on the careful finish of a priest's dress, and in the tasteful decoration of an article of furniture, proves them to be the work of an ingenious and painstaking people. From the bas-reliefs we gain but little information respecting the private life of the Assyrians. There are a few which represent the foddering of cattle, women riding on mules, &c.

It is natural to expect that Nineveh—a wealthy and luxurious city—imported many of the products of other countries, yet the manufactured goods would mainly be of home production. The jars, bronzes, glass bottles, carved ornaments in ivory and mother-of-pearl, engraved gems, bells, earrings, arms, utensils, are of excellent workmanship. The ornaments especially are in good taste, and evince no inconsiderable skill in the working of metals. Transparent glass was not unknown, nor the use of the lens as a magnifying agent. The Assyrians knew the principle of the arch, the use of the lever and roller, and the construction of aqueducts and drains. In the

arts of peace, they appear to have been not inferior to any ancient nation; while their conquests, and the long duration of their empire, suffice to prove their capacity for war. Even their ruin, though usually ascribed to degeneracy in warlike spirit, may possibly, with equal probability, be attributed to the neighbourhood of a powerful and jealous rival, aided by the arms of the most formidable of its subject states.

ASTACUS. See CRAYFISH and LOBSTERS.

ASTARTÉ (styled Ashtaroth in the Old Testament), the name of the chief female deity of the Phœnicians, Carthaginians, and Syrians (Syria Dea), also worshipped by the Jews in times when idolatry prevailed. A. was the original from which the Greeks borrowed their Aphrodite (q. v.). As Baal was god of the sun, A. was goddess of the moon. Her chief temples were in Tyre and Sidon. According to ancient accounts, her worship was of a licentious character. The oldest known image of her—that in Paphos—represented her simply under the form of a white conical stone. In Canaan and Phœnicia she was subsequently typified under the form of a cow, or sometimes she had only a cow's or bull's head; still later, her emblem became a star; and finally, she was conceived of as the 'queen of heaven,' sitting on a lion, her head surrounded with rays, and in the one hand a thunderbolt, in the other a sceptre.

ASTARTÉ, a genus of Mollusca, with bivalve shells, the type of a family *Astartidae*, very closely allied to the *Veneridae* or Venus family. It is interesting chiefly with reference to geologic changes and the history of life and organisation, because only a few species seem now to exist, and these limited to the North Atlantic and Arctic Oceans, whereas the fossil species are extremely numerous, commencing with the *lias* period, and distributed over the whole world. The *Astartidae* may be regarded as having given place to the *Veneridae*, which commenced with the oolitic period, and are among the most abundant bivalve mollusca of the present time.

A-STAY', the position of an anchor when, during heaving, the cable forms an acute angle with the surface of the water.

ASTER (Gr. a star, from the form of the flowers), a genus of plants of the natural order *Compositæ*, which Lindley has therefore chosen to call *Asteraceæ*. The ray and the disk are of different colours. The genus contains a great number of species, both herbaceous and shrubby, which have been arranged into six or seven groups, regarded by many as distinct genera. One species only, *A. Tripolium* or *Tripolium vulgare*, the Sea Starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New-England A. (*A. Nova Angliæ*) and the Michaelmas Daisy (*A. Tridacanti*), both natives of North America, are perhaps the most common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China A. (*A. Chinensis*), a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China in the earlier part of the 18th c. The varieties exhibit great diversities of form and colour. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the

young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden.—*A. argophyllus*, or *Hastonia argophylla*, is a shrub, a native of Van Diemen's Land, smelling strongly of musk. The whole plant has a whitish aspect. It grows to a considerable size, but succeeds in the open air only in the very south of England.

ASTERABAD. See ASTRABAD.

ASTERIAS AND ASTER'ADÆ. See STAR-FISH.

A'STERISK (Gr. a little star), a sign or symbol (*), used in writing and printing either as a reference to a note at the bottom or on the margin of the page. The obelisk (q. v.), or dagger (†), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, &c. The A. and other similar signs may have any arbitrary meaning assigned to them at the will of the writer, an explanation being previously given what the signification is to be. The Greek grammarians, or critics, used the A. to mark a passage that had been unjustly suspected, but was to be held as genuine, or a passage in any way remarkable; the obelisk, again, marked an interpolated or an objectionable word or passage.

ASTEROIDS. See PLANETOIDS.

ASTEROPHYLLITES (Gr. *aster*, a star, and *phyllon*, a leaf), a generic name, under which are included many of the most abundant fossil plants of the coal-measures. The leaves are arranged in a stellated manner around the stems or branches. The A. are ranked among the exogenous or dicotyledonous fossils, but they are of doubtful affinity, and the exact determination of their place in the system has not yet been accomplished.

A'STHMA is a disease characterised by the breathing, previously natural, becoming difficult, and accompanied by wheezing and a distressing sense of tightness in the chest. A. generally appears at first after some inflammatory affection of the respiratory mucous membrane, and more especially in those who have led dissipated lives. In others, it is clearly hereditary, and frequently affects several members of the same family. A. may be habitual, or may occur in spasms, generally preceded by some premonitory symptoms, as in some by great drowsiness; others, says Dr. Hyde Salter, 'know by extreme wakefulness and unusual mental activity and buoyancy of spirits; and I knew one case in which an attack of ophthalmia occurred.'

The spasms may occur at any hour; but in nineteen out of twenty cases they waken the patient from sleep between three and four in the morning. The horizontal position facilitating the flow of blood to the right side of the heart, and therefore to the lungs, the disadvantage at which the muscles of respiration are placed, and the greater readiness with which sources of irritation act during sleep, explain this fact.

Persons subject to A. scarcely dare fall asleep after any imprudence in diet; if they continue awake till their supper is fairly digested, and the stomach empty, they may go to sleep fearlessly, and have a good night's rest. The asthmatic paroxysm is thus described by Dr. Salter, the latest authority on this common but terrible disease: 'The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze, so as to waken those in adjoining rooms. He awakes, changes his position, falls asleep again and again,

and the miserable fight between A. and sleep may go on, till the increased suffering does not allow the patient longer to forget himself for a moment; he becomes wide awake, sits up in bed, throws himself forward, plants his elbows on his knees, and with fixed head and elevated shoulders, labours for breath like a dying man.'

If the spasm is protracted, the oxygenation of his blood is imperfectly performed, owing to the scanty supply of air, and his extremities get cold and blue, but at the same time the violent muscular efforts at respiration cover him with sweat. The pulse is always small. The muscles of the back and neck attached to the ribs, act as extraordinary muscles of respiration. The chest enlarges during the paroxysm, but in it there is almost perfect stagnation of air. The respiratory tubes affected are very small, and the parts at which they are so constricted are constantly shifting.

The remedies for A. are numerous, but not to be depended on. They consist in paying attention to the digestive system, and in anti-spasmodics, either taken internally or by inhalation.

A'STI (*Asta Pompeia*), a city of Piedmont, in the government of Alessandria, lies on the left bank of the Tanaro, on the line of railway from Turin to Genoa, 26½ miles E.S.E. of Turin. Pop. 25,200. It is a large town, with walls considerably dilapidated, and the streets generally very narrow and irregular. It is the seat of a bishop, and has a court of justice and a royal college. There is carried on a considerable trade in silk and woollen fabrics, leather, and hats, as well as in wines and agricultural produce. A. is a town of high antiquity, having been famous for its pottery before its capture by the Gauls in 400 B.C. On the occasion of its being again taken and destroyed in an irruption of the Gauls, it was rebuilt by Pompey, and received the name of *Asta Pompeia*. In the middle ages, A. was one of the most powerful republics of Upper Italy. It was captured and burnt by the Emperor Frederick I. in 1155; and after a series of vicissitudes, it came into the possession of the Visconti of Naples, by whom it was ceded to the French, in whose hands it remained till the middle of the 16th c., when it came into the possession of the Dukes of Savoy, as it still remains.—The province of Asti, one of the six subdivisions of the government of Alessandria, is bounded on the W. and N. by the province of Turin, S. by Alba, S. E. by Alessandria Proper, and N. E. by the province of Casale. The surface is hilly and picturesque. The soil rests upon limestone abounding in fossils, and is fertile, producing corn, fruit, and wine. It is celebrated for a fine white wine resembling champagne, called *vino d'Asti*. Silk is one of its most important products, and the mulberry is extensively cultivated. Pop. 118,709.

ASTON, LUISE, a German authoress of some note, but principally known for her zeal in behalf of the 'rights of women.' She was born in the vicinity of Halberstadt, and at an early age was married to a wealthy English manufacturer. Their union was not happy; perhaps her peculiar views of society and of the proper position of her sex contributed to the estrangement of their sympathies. After separating from her husband she attracted public attention, especially in Berlin, by appearing on the streets in man's dress, smoking cigars, &c. This conduct brought her into several collisions with the police, and she was twice forced to leave the city. During the Schleswig-Holstein war, however, she found a nobler sphere for her woman's nature, and displayed the greatest heroism and self-sacrificing devotion as an hospital nurse. She has written various books, the principal are—*Wild*

Roses (Berlin, 1846), and *Freischärler-Reminiscenzen* (Leip. 1849), each of which contains twelve lyrical poems, none remarkable for ability; *Meine Emancipation, Verweisung, und Rechtfertigung* (My Emancipation, Exile, and Vindication, Brussels, 1846); a novel, *Aus dem Leben einer Frau* (The Biography of a Woman, Hamburg, 1847); *Revolution und Contre-revolution* (Mannh. 1849). In the beginning of 1851, she married Dr. Meier of Bremen.

ASTOR, JOHN JACOB, an enterprising merchant, founder of the 'American Fur Company,' was born in a village near Heidelberg, in Germany, 1763. After spending some years in London, he sailed to America in 1788, and soon invested his small capital in furs. By economy and industry, he so increased his means that after six years he had acquired a fortune of 200,000 dollars. Although the increasing influence of the English Fur Companies in North America was unfavourable to his plans, he now ventured to fit out two expeditions to the Oregon territory—one by land, and one by sea—the purpose of which was to open up a regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria (q. v.) was established; but the war of 1812 stopped its prosperity for a time. From this period A.'s commercial connections extended over the entire globe, and his ships were found in every sea. He died March 29, 1848, leaving property amounting to 30,000,000 dollars. He left a legacy, amounting to 350,000 dollars, for the establishment of a public library in New York. (Washington Irving's *Astoria*.)

ASTORGA, EMANUELE D', a musician, celebrated partly on account of his personal history, was born in Sicily in 1680. His father, a baron of Sicily, in the contest respecting the annexation of the island to Spain, was delivered over to the enemy by his own mercenary soldiers, and was executed in 1701; while his wife and son (Emanuele) were barbarously compelled to witness the tragedy. The wife died on the spot, and the son fell into a state of unconsciousness. Afterwards, through the interest of the Spanish Princess Ursini, he was educated in a monastery at Astorga in Leon, from which he derived his name. Here he especially devoted himself to music, and made such progress that, in a few years, he was invited to the court of the Duke of Parma. His patron, erroneously suspecting that his daughter was receiving the addresses of the musician, sent him away to the court of the Emperor Leopold. After Leopold's death, A. travelled through a great part of Europe, and it is supposed that he died in a Bohemian monastery. His best work is the *Stabat Mater*, a masterly composition, of which the original score is still preserved in Oxford.

ASTORIA, originally a fur-trading station on the left bank of the Columbia, near the Pacific, taking its name from its founder, John Jacob Astor of New York. It demands notice here chiefly as having been a main point in the American claim to the Oregon Territory (q. v.).

ASTRABAD, a town in the north of Persia, capital of the province of the same name, is built at the foot of the northern slope of the Elbruz Mountains, on a small river which runs into A. Bay, at the south-east extremity of the Caspian, from which it is distant 20 miles. Lat. 36° 50' N., long. 54° 31' E. It was long the residence of the Kajar princes, from whom the present Shah of Persia is descended; but on account of its situation in a remote corner of the kingdom, it was not advanced to the dignity of the metropolis of Persia. Teheran, at the foot of the chain of mountains which

separates Iran from Mazanderan, became the capital, and since then the importance of A. has considerably sunk. It is still enclosed by a dry ditch and mud-wall, 3 miles in circumference, but its great towers have disappeared. Trade is small. The causeway constructed by Shah Abbas is, however, kept in good repair, and connects A. with Khorasan, Afghanistan, &c. Pop. varies from 4000 to 10,000, on account of the unhealthiness of the place during the summer rains.

ASTRÆA, daughter of Zeus and Themis, or of Astræus and Aurora, was the goddess of justice, the last of all the goddesses who left the earth when the golden age had passed away and men began to forge weapons and perpetrate acts of violence. She took her place in heaven as the constellation Virgo in the zodiac.—Greek art usually represented her with a pair of balances in her hand, and a crown of stars on her head.—A. is also the name of one of the Planetoids (q. v.).

ASTRÆA. See CORAL and MADREPORE.

ASTRAGALUS, a bone of the foot, which, by a convex upper surface and smooth sides, forms, with the leg-bones, the hinge of the ankle-joint. Its lower surface is concave, and rests on the *os calcis*, or heel-bone, to which it is attached by a strong ligament. In front, it has a round head, which rests in the concavity of the scaphoid, another bone of the tarsus, and upon an elastic ligament, its pressure upon which gives in a great measure the necessary elasticity to the foot: it is at this joint that inversion and eversion of the foot take place. It will be seen that the A. is a bone of great importance to the member, as it supports the weight of the body in standing, and enters into most of the movements of the foot. It is occasionally displaced, generally in front of the outer ankle.

ASTRAGALUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The

Astragalus Boissianus.

pod is more or less perfectly 2-celled. The leaves are pinnate, with a terminal leaflet. The species are numerous, natives chiefly of the temperate and

colder parts of the Old World, shrubby, and often spiny, or unarmed and herbaceous. A number of the shrubby species yield the substance called Tragacanth (q. v.), or Gum Tragacanth.—*A. Boiticus*, an annual, native of the south of Europe, with upright branching stems, is cultivated in Hungary, Germany, and other parts of Europe, for its seeds, which are roasted, ground, and used as a substitute for coffee, or mixed with it to improve its flavour.—The Sweet Milk-vetch, or Wild Liquorice (*A. glycyphyllos*), a native of Britain and other parts of Europe, perennial, with long and very thick roots, which penetrate deep into the soil, and almost prostrate stems, three feet in length, is occasionally cultivated for food of cattle, yielding a very abundant herbage. Cattle are not fond of it at first, but are said to become fond of it after being accustomed to it for some time. The roots have somewhat of the sweetness of liquorice.

ASTRAKHA'N, originally a province of the Mogul empire, but united with the Russian empire in 1554. At present, A. forms one of the south-east governments of Russia in Europe, and is bounded on the S. by the Caspian Sea and the Caucasus; on the W. by the country of the Don Cossacks; on the N., by the government of Saratov; and on the E., by Orenburg. Area, 50,000 square miles; pop. 285,000. The province of A. is almost entirely a barren waste, the only fertile portions being the banks of the Volga, which divides the province into two equal parts. Salt is procured from the marshes of the steppes, considerable numbers of cattle are reared, and the annual value of the sturgeon-fishing in the Volga is as much as 2,500,000 rubles (about £400,000). The climate varies from 70° F. in summer, to 13° in winter. The population is composed of diverse elements—Russian, Tatar, Georgian, Armenian, Bokharese, Persian, and Hindu.

ASTRAKHA'N, the chief town of the government of the same name, is situated on an island of the Volga, and near the Caspian Sea, in lat. 46° 21' N., and long. 48° 4' E. It is the seat of a Greek archbishop and an Armenian bishop; has thirty-seven Greek, two Roman Catholic, one Protestant, and two Armenian churches; fifteen mosques, an Indian temple, a gymnasium, a seminary for priests, a botanical garden, and many manufactories. Pop. 30,480. The houses are mostly of wood, and irregularly built. The fisheries in the Volga supply occupation to great numbers of the inhabitants of A. and its neighbourhood. The principal exports are leather, linen and woollen goods, salted sturgeon, caviar, and isinglass. Imports consist chiefly of gold-embroidered silken goods from Persia, silk stuffs, woollen goods, rice, rhubarb, raw silk, drugs, &c. From July to October, the neighbourhood of A. is frequently visited by swarms of locusts.—A. is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

A'STRAL SPIRITS. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine, that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, A. S. are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented, according to the notion formed

of their nature. As the belief in spirits and witchcraft reached its height, in the 15th c., the demonologists, or special students of this subject, systematised the strange fancies of that wild period; and A. S. were made to occupy the first rank among evil or demoniacal spirits. Paracelsus, however, and others attributed to every human being an astral spirit, or sidereal element, in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies.

ASTRINGSENTS, medicines employed for the purpose of contracting the animal fibres and canals, so as to check fluxes, hæmorrhage, and diarrhœa. The drugs most commonly used as A. are alum, catechu, oak-galls, rhatany-root, &c. Many of the vegetable A. owe that property, in whole or in great part, to tannin. A severe degree of cold is a powerful astringent.

ASTROCARYUM (from the Gr. *astron*, a star, and *karyon*, a nut), a genus of Palms, of which about sixteen species are known, natives of tropical America, remarkable for the abundance of acute and formidable spines—in some cases, a foot long—with which almost every part—stem, leaves, spathe, and fruit-stalk—is armed. They have beautiful pinnated leaves; some of them are lofty, others are of very moderate height, as 8—15 feet, whilst some are almost or altogether stemless. The fruit of some species is eatable—a juicy pulp covering a stony seed—as the fruit of the MURUMURU palm (*A. Murumuru*), the pulp of which is said to resemble a melon in flavour, has a sort of musky odour, and is highly esteemed. It is a palm of only about 8—12 feet high, abundant about Pará and elsewhere on the Amazon. Cattle roam the forests in quest of its fruit, and swine fatten on the seed, which they crush with their teeth, although to break it requires a smart blow of a hammer, and in hardness it

Tucum Palm (*A. vulgare*).

almost resembles vegetable ivory. Another edible fruit is that of the TUCUMA palm (*A. Tucuma*), abundant in the same regions. These fruits are about an inch long, the Murumuru ovate the Tucumá

almost globular. The Tucumá palm is 30—40 feet high, the stem encircled with narrow rings of black spines, which are disposed with beautiful

Stemless Palm (*A. acule*).

b, spathe, with spathe forming a hood over fruit; c, fruit, about one-fifth natural size.

regularity. The Tucum palm (*A. vulgare*), a species quite distinct from the Tucumá, and more lofty, is of great importance to the Indians, and in places where it is not indigenous, is cultivated with care for the sake of the epidermis of its unopened leaves, of which they make cordage, very useful for bow-strings, fishing-nets, &c. The fibre is at once fine, strong, and durable, and may yet perhaps become important as an article of commerce. Beautiful hammocks are made of tucum thread, which are sold at about £3 each, or if ornamented with feather-work borders, at twice that sum. Martius, in his great work on Palms, has, by mistake, represented the Tucumá instead of the Tucum palm as yielding this fibre. See Wallace, *Palm Trees of the Amazon*. Lond. 1853. The fibre is obtained by cutting down the terminal bud or column of unopened leaves which rises from the centre of the crown of foliage. The tender leaflets are then carefully stripped of their epidermis, in pale, ribbon-like pellicles which shrivel up almost to a thread. These are tied in bundles, and dried, and are afterwards twisted into thread, or made into thicker cords, by mere rolling and manipulation.

ASTROLABE (from two Greek words signifying 'to take the stars'), the name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the Armillary sphere (q. v.), were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an A. in the palmy days of astrology, and was the badge of the astrologer. The A. has been superseded by the more perfect instruments of modern astronomy.

ASTROLOGY meant originally much the same as *astronomy*, 'the knowledge of the stars,' but was at length restricted to the science of predicting future events, especially the fortunes of men, from the positions of the heavenly bodies. This was considered the higher, the real science; while the mere knowledge of the stars themselves, their places and motions (astronomy), was, till a very recent period, cultivated mostly with a view to (judicial) astrology. A. is one of the most ancient forms of superstition, and is found prevailing among the nations of the East (Egyptians, Chaldeans, Hindus, Chinese) at the very dawn of history. The Jews became much addicted to it after the captivity. It spread into the West and to Rome about the beginning of the Christian era.

Astrologers played an important part at Rome, where they were called Chaldeans and Mathematicians; and though often banished by the senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet Manilius, author of an astronomical poem still extant, was addicted to A.; and even Ptolemy the astronomer did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardour by the Arabs from the 7th to the 13th c. Some of the early Christian fathers argued against the doctrines of A., others received them in a modified form. In its public capacity, the Catholic Church several times condemned the system; but many zealous Catholics, even churchmen, have cultivated it. Cardinal d'Ailly, 'the Eagle of the doctors of France' (died 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge might have been predicted by A. For centuries the most learned men continued devoted to this delusive science; Regiomontanus, the famous mathematician Cardan, even Tycho Brahé and Kepler could not shake off the fascination. Kepler saw the weakness of A. as a science, but could not bring himself to deny a certain connection between the positions ('constellations') of the planets and the qualities of those born under them. The Copernican system gave the death blow to A. When the earth itself was found to be only one of the planets, it seemed absurd that all the others should be occupied in influencing it. The argument has really little force, but it produced the effect. Belief in A. is not now ostensibly professed in any Christian country, though a few solitary advocates have from time to time appeared, as J. M. Pfaff in Germany, *Astrologie* (Bamb. 1816). But it still holds sway in the East, and among Mahomedans wherever situated. Even in Europe the craving of the ignorant of all countries for divination is still gratified by the publication of multitudes of almanacs containing astrological predictions, though the writers no longer believe in them.

Many passages of our old writers are unintelligible without some knowledge of astrological terms, numbers of which have taken root in the language. In the technical rules by which human destiny was foreseen, the heavenly houses played an important part. Astrologers were by no means at one as to the way of laying out those houses. A very general way was to draw great circles through the north and south points of the horizon, as meridians pass through the poles, dividing the heavens, visible and invisible, into twelve equal parts—six above the horizon, and six below. These were the twelve houses, and were numbered onward, beginning with that which lay in the east immediately below the horizon. The first was called the house of life; the second, of fortune, or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death, or the upper portal; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies, or of captivity. The position of the twelve houses for a given time and place—the instant of an individual's birth, for instance—was a *theme*. To construct such a plan was to *cast* the person's nativity. The houses had different powers, the strongest being the first; as it contained the part of the heavens about to rise, it was called the *ascendant*, and the point of the ecliptic cut by its upper boundary was the *horoscope*. Each house had one of the heavenly bodies as its *lord*, who was strongest in his own house.

ASTRONOMY (Gr. *astron*, a star, *nomos*, a law)

teaches whatever is known of the heavenly bodies. A. may be properly divided under three heads. 1. *Geometrical or Mathematical A.*, including the exact determination of the numerical and geometrical elements of the heavenly bodies—that is, their distances, shapes, magnitudes, the figures they describe in their motions, &c. 2. *Physical A.*, or the nature of the powers or forces that carry on the heavenly motions, the laws that they observe, and the calculation of the motions from a knowledge of these laws. 3. *Sidereal A.*, or whatever is ascertained regarding the universe of the fixed stars. *Practical A.* might form another division, which would include a knowledge of the various astronomical instruments; and a familiarity generally with the rules and calculations by which the requisite results are deduced from observations.

Such parts of this extensive subject as are deemed suited to the present work, will be found under their appropriate heads, such as CIRCLE, TRANSIT INSTRUMENT, ABERRATION, REFRACTION, PARALLAX, EQUATOR, PRECESSION OF THE EQUINOXES, TIME, SOLAR SYSTEM, SUN, LIBRATION OF THE MOON, PLANETS, PLANETARY MOTION, FIXED STARS, COMETS, &c. A brief sketch of the history of astronomical discovery is all that can be attempted in the present article.

The history of A. dates from a very early period. It is the most ancient of all the sciences. The Chinese, Hindus, Chaldeans, Egyptians, and even the Greeks, are known to have investigated the heavens very long before the Christian era. But with the first four nations, A. may be said to have been a sentiment rather than a science—a vague notion built up out of crude speculations, rather than a correct theory founded on systematic observation. In China, A. was intimately associated with state politics; the Indians, Chaldeans, and Egyptians made it a matter of religion; and each of these nations applied it to astrological purposes. In Greece alone was it prosecuted for its own sake.

The Chinese, Chaldeans, Hindus, and Egyptians each claim the honour of having been the first students of A., and each has had advocates to support its claim. The Tirvalore tables (asserted by the Hindus to belong to an epoch of 3102 years B. C.—the commencement of the Cali-yug, or iron age, of their mythology—at which period a conjunction of the sun, moon, and planets is said to have occurred) are, so far as their date is concerned, altogether unreliable. Modern calculations have conclusively proved that no such conjunction could possibly have taken place at the time specified; and the elements of the tables are, in the general opinion of scientific men, of a character far in advance of the actual observations of that period. There is no doubt that the epoch is fictitious—that the date of these tables is fixed much earlier than their internal evidence justifies; but it is matter of dispute whether they were the result of the observation of Hindus themselves at some later period before the Christian era, or whether they were constructed after that era from data furnished to them by the Arabs or Greeks. Those who hold the former view, quote the well-known mathematical attainments of the Indians, and their aversion to intercourse with foreigners, as arguments in its favour; those who support the latter, point out that the tables are a mean between those of Ptolemy and Albategnius, or Al Batani, a distinguished Arabian astronomer, and therefore likely to have been derived from these two sources. Those who are interested in the question of the originality of these tables, may refer to Delambre, and to Bailly's *Hist. de l'Astronomie Indienne*.

The Chinese have astronomical annals claiming to go back 2857 years B. C. In these there is little

record of anything but of the appearance of comets and solar eclipses; and regarding the latter phenomena, they tell nothing, save the fact and date of their occurrence. Professional astronomers were compelled to predict every eclipse under pain of death. The popular idea was, that an eclipse was a monster having evil designs on the sun, and it was customary to make a great noise, by shouting, beating of gongs, &c., in order to frighten it away from its solar prey. The many eclipses which the Chinese report have been recalculated, but not more than one anterior to the time of Ptolemy could be verified. At an early period, however, the Chinese appear to have been acquainted with the luni-solar cycle of nineteen years (introduced into Greece by Meton, and since known as the Metonic Cycle), and they had also divided the year into 365½ days. Solstitial observances are said to have been made by a gnomon in the 11th c. B. C. To the burning of all scientific books by one of their princes (Tsin-Chi-Hong-Ti), 221 B. C., the Chinese attribute the loss of many theories, or methods previously in use. The precession of the equinoxes was not known to the Chinese until 400 A.D., but long prior to that they were familiar with the motion of the planets.

The mass of evidence seems in favour of the plains of Chaldaea being the primal seat of observative A. The risings and settings of the heavenly bodies and eclipses were subjects of observation and notation by their priests at a very remote period. Simplicius and Porphyry mention that Aristotle had transmitted to him from Babylon, by order of Alexander the Great, a catalogue of eclipses observed during 1903 years preceding the conquest of that city by the Macedonians. Ptolemy gives six of the eclipses from this catalogue, but the earliest does not extend further back than 720 B.C. The probability therefore is, that the statement of Simplicius, as to their early date, is an exaggeration. In these observations, the time is only given in hours, and the part of the diameter eclipsed within a quarter; but rough as they are, they are the earliest reliable observations extant; and a comparison of them with modern observations, led Halley to the discovery of the doctrine of the moon's acceleration—that is, that she now moves round the earth with greater velocity than formerly. It is remarkably illustrative of their habit of diligent observation, that the Chaldeans were acquainted with the cycle of 6585½ days, during which the moon makes about 223 synodical revolutions, and experiences the same number of eclipses, alike, too, in order and magnitude, comparing cycle with cycle. The clepsydra as a clock, the gnomon for determining the solstices, and a hemispherical dial for ascertaining the positions of the sun, were used by the Chaldeans, and they have the credit of the invention of the zodiac and the duodecimal division of the day.

The Egyptians, it is supposed, were the first instructors of the Greeks in A. They do not, however, appear to have observed much for themselves. The meaning of what data they have left behind them can be guessed at only in a few instances. No mention is made by Ptolemy of the idea ascribed to them, that the planets Mercury and Venus moved round the sun; the probability therefore is, Ptolemy not being likely to overlook such a novel theory, that they entertained no such notion at the time of his visit, but that it is an after-thought of more recent ages. From the accuracy with which some of the pyramids face the cardinal points, there is a supposition that they must have been erected for astronomical purposes; but if it be true, as is stated, that Thales taught the Egyptians how to find the height of the pyramids by the shadow, and that the latter informed Herodotus

that the sun had twice been seen to rise in the west, the conclusion is that the A. of the ancient Egyptians was very meagre and absurd.

Up to this time, A. is little else than tradition. The Greeks have the honour of elevating it into a reliable history, and to the dignity of a science. Thales (640 B.C.), the founder of the Ionic school, laid the foundation of Greek A. He it was who first propagated the theory of the earth's sphericity. The sphere he divided into five zones. He predicted the year of a great solar eclipse, but this it is now supposed he must have casually succeeded in doing—the Greeks at this time having no observations of their own to guide them—by means of the Chaldaean Saros, or period of eighteen years and ten days, which gives a regular recurrence of eclipses. He made the Greeks, who, prior to his time, were content to navigate their vessels by the Great Bear—a rough approximation to the north—acquainted with the lesser constellation of that name, a much better guide for the mariner. His system, however, contained a good deal of absurdity. Among other things, he held that the stars were composed of fire, and that the earth was the centre of the universe. The successors of Thales held opinions which in many respects are wonderfully in accordance with modern ideas. Anaximander, it is said, held that the earth moved about its own axis, and that the moon's light was reflected from the sun. To him is also attributed, on somewhat slender authority, the belief in the grand idea of the plurality of worlds. Anaxagoras, who transferred the Ionic school from Miletus to Athens, is said to have offered a conjecture that, like the earth, the moon had habitations, hills, and valleys.

Pythagoras (500 B.C.), who was the next astronomer of eminence, was very far in advance of his predecessors. He promulgated, on grounds fanciful enough, the theory, the truth of which, however, has been since established, that the sun is the centre of the planetary world, and that the earth circulates round it. Pythagoras also first taught that the morning and evening star were in reality one and the same planet. But the views of Pythagoras met with little or no support from his successors until the time of Copernicus. Between Pythagoras and the advent of the Alexandrian school, nearly a couple of centuries later, the most prominent names in astronomical annals are those of Meton (432 B.C.), who introduced the luni-solar cycle, as already intimated, and in conjunction with Euctemon, observed a solstice at Athens in the year 424 B.C.; Callippus (330 B.C.), who improved the Metonic cycle; Eudoxus of Cnidus (370 B.C.), who brought into Greece the year of 365½ days, and wrote some works on A.; and Nicetas of Syracuse, who is reported to have taught the diurnal motion of the earth on its axis.

To the Alexandrian school, owing its existence to the munificent Ptolemies, we are indebted for the first systematic observations in A. Hitherto the truths of A. rested on no better evidence than the conjectures of sagacious minds, and these being opposed to the testimony of the senses, met with but little acceptance from the world. The Alexandrian school originated a connected series of observations relative to the constitution of the universe. The positions of the fixed stars were determined, the paths of the planets carefully traced, and the solar and lunar inequalities more accurately ascertained. Angular distances were calculated with instruments suitable to the purpose by trigonometrical methods, and ultimately the school of Alexandria presented to the world the first system of theoretical astronomy that had ever comprehended an entire plan of the celestial motions. The system we know to

be false, and inferior to the Pythagorean notions; but it had the merit of being founded upon a long and patient observation of phenomena, a principle which finally brought about its own destruction, while the previous theories were the results of pure hypothesis.

The most interesting circumstances connected with the early history of the Alexandrian school are the attempts made to determine the distance of the earth from the sun, and the magnitude of the terrestrial globe. Aristarchus of Samos—the pioneer of the Copernican system, as Humboldt calls him—is the author of an ingenious plan to ascertain the former. See ARISTARCHUS OF SAMOS.

Among other eminent members of this school were Timocharis and Aristyllus, who made the observations, which, together with observations of his own, enabled Hipparchus (q. v.) to discover the precession of the equinoxes; Eratosthenes (q. v.), who was the first who attempted to determine on true principles the magnitude of the earth, and to clear, as Humboldt expresses it, 'the description of the earth from its fabulous traditions;' and Autolycus, whose books on A. are the earliest extant in the Greek language.

We have now arrived at by far the greatest name we have yet met in astronomical science—that of Hipparchus of Bithynia (160—125 B.C.), and here may be said to begin the real written history of scientific A.; for not until his era were there facts correct enough and sufficient in number upon which to build a system. Hipparchus was at once a theorist, a mathematician, and an observer. He catalogued no less than 1081 stars. This is the first reliable catalogue we have. He discovered, as we have already mentioned, the precession of the equinoxes; he determined with greater exactitude than his predecessors had done, the mean motion, as well as the inequality of the motion of the sun; and also the length of the year. He also determined the mean motion of the moon, her eccentricity, the equation of her centre, and the inclination of her orbit; and he suspected the inequality afterwards discovered by Ptolemy (the evection). He invented processes analogous to plane and spherical trigonometry, and was the first to use right ascensions and declinations, which he afterwards abandoned in favor of latitudes and longitudes.

For more than two centuries and a half after the demise of this indefatigable astronomer, we meet with no name of note. Ptolemy (130—150 A.D.) is the next who rises above the mass of mediocrities. Besides being a practical astronomer, he was accomplished as a musician, a geographer, and mathematician. His most important discovery in A. was the libration or evection of the moon. He also was the first to point out the effect of refraction. He extended and improved many of the theories of Hipparchus, and was the founder of the false system known by his name, and which was universally accepted as the true theory of the universe, until the researches of Copernicus exploded it. The Ptolemaic system, expounded in the *Great Collection*, or, as it was called by the Arabs, the *Almagest*—from which source most of our knowledge of Greek A. is derived—placed the earth immovable in the centre of the universe, making the entire heavens revolve round it in the course of twenty-four hours.

With Ptolemy closes the originality of the Greek school. His successors were men of no mark, confining themselves for the most part to astrology, or to comments on earlier writers. It is to the Arabs that we owe the next advances in A. They commenced making observations 762 A.D., in the reign of the Caliph Al Mansur, who gave great encouragement to science, as did also his successors, the 'good Haroun Alraschid' and Al Mamoun, both of

whom were themselves diligent students of A. For four centuries, the Arabs prosecuted the study of the science with assiduity, but they are chiefly meritorious as observers. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. They, however, determined with much more accuracy than the Greeks had done the precession of the equinoxes, the obliquity of the ecliptic, and the solar eccentricity; and the length of the tropical year was ascertained within a few seconds of the truth. The most illustrious of the Arabian school were Albatgenius or Al Batani (880 A.D.), who discovered the motion of the solar apogee (see ANOMALISTIC YEAR), and who was also the first to make use of sines and versed sines instead of chords; he corrected the Greek observations, and was altogether the most distinguished observer between Hipparchus and the Copernican era; and Ibn-Yunis (1000 A.D.), an excellent mathematician, who made observations of great importance in determining the disturbances and eccentricities of Jupiter and Saturn, and who was the first to use cotangents and secants.

In the northern part of Persia, an observatory was erected by a descendant of the renowned warrior Genghis Khan, where some tables were constructed by Nasir-Eddin; and at Samarcand, Ulugh Beg, a grandson of Timur, made, in 1433 A.D., many observations, and the most correct catalogue of stars which, up to his time, had been published.

In the 13th c., A. was again introduced into Western Europe, the first translation from the *Almagest* being made under the Emperor Frederick II. of Germany, about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alfonso X. of Castile. An Englishman, named Holywood (Sacrobosco), in 1220 wrote a book of great repute in its day on the spheres, chiefly abridged from Ptolemy; and among others who did much to promote a taste for A. were Purbach (1460), Regiomontanus (John Muller), who died in 1476, and Waltherus, a pupil of the latter, who made numerous observations of merit.

We now come to the illustrious name of Copernicus (b. 1473, d. 1543), to whom was reserved the grand honour and the danger—for there is ever danger in bringing old notions into disrepute by introducing new systems of truth—of exploding the Ptolemaic idea, and of promulgating a correct though imperfect theory of the universe. His system is in some part a revival and systematic application of the opinions said to have been held by Pythagoras. It makes the sun the immovable centre of the universe, around which all the planets revolve in concentric orbits, Mercury and Venus within the earth's orbit, and all the other planets without it. In the Copernican theory, there were many of the old notions which have since been exploded. It is a current belief that Copernicus, afraid to state boldly such heterodox views of the universe as those he entertained, gave them forth in the form of an hypothesis. Humboldt, in his second volume of *Cosmos* (p. 345), denies that he did so. This distinguished authority says: 'The language of Copernicus is powerful and free, and bursts forth from his inmost convictions, and thus sufficiently refutes the ancient opinion, that he has brought forward the system which is immortalised by his name, as an hypothesis made for the convenience of calculating astronomers, or for one which has but a probable foundation.' The same author also refutes the popular notion that Copernicus died a few hours after receiving a printed copy of his book. He was broken down in body and mind when his work *On the Revolutions of the Heavenly Bodies* was brought to him, but he did

not die until 'many days afterwards, on the 24th May 1543.'

Among the contemporaries of Copernicus were Rheinhold, who constructed the Prutenic tables; Recorde, who was the first to write on A. in English; and Nonius, a Portuguese, who invented a method for dividing the circle. The study of A. was also much aided about this time by the liberality of the Landgrave of Hesse-Cassel, William IV.

Decidedly the most industrious observer and eminent practical astronomer from the time of the Arabs to the latter half of the 16th c. was Tycho Brahé (b. 1546, d. 1601). Considerable odium attaches to him on account of his repudiation of the Copernican system, but it should not be forgotten that in the time of Tycho that system was not supported by the conclusive evidence we are now in possession of. Tycho's system, which made the sun move round the earth, and all the other planets round the sun, they moving with it round the earth, explained all natural phenomena then observed equally well, while it must have appeared more probable than the crude and, at that era, undemonstrable theories of Copernicus. Tycho Brahé compiled a catalogue of 777 fixed stars, more perfect than any that had previously appeared. He made the first table of refractions, and discovered the variation and annual equation of the moon, the inequalities of the motion of the nodes, and the inclination of the lunar orbit, and rejected the trepidation of the precession, which had hitherto injuriously affected all tables. He also made some interesting cometary investigations.

To his researches are mainly due the discovery by Kepler (b. 1571, d. 1630) of those famous laws which have rendered his name immortal. See KEPLER'S LAWS. To Kepler is due the credit of divesting the Copernican system of its absurdities. Kepler is also said to have had some notion of the law of gravitation.

Galileo Galilei (b. 1564, d. 1642) first applied the telescope (which he made from a general description of the instrument of Hans Lipperhey of Holland, who was the first inventor of the telescope) to the investigation of the heavens. He was rewarded by the discovery of the inequalities on the moon's surface. The important discoveries of the four satellites of Jupiter, the ring of Saturn—not then distinctly recognised as a circle—the spots on the sun, and the crescent form of Venus, followed in quick succession. For propagating the Copernican doctrine of the world, Galileo incurred the displeasure of the priests, and was compelled by the Inquisition to retract his opinions.

But the eternal laws of nature are not to be suspended by the recantation of a philosopher forced by the tyranny of priestcraft. The earth moved grandly on round the sun in spite of both; and scientific truth was now too old to remain in the restrictive leading-strings of any ecclesiasticism.

The next great epoch in the history of A. brings us to England and Newton (b. 1642, d. 1727). In the interval, practical A. had profited largely by the logarithms of Napier; the mathematical researches of Descartes; the application of the telescope to the quadrant by Gascoigne, an Englishman, and afterwards by Auzout and Picard; by Römer's discovery of the progressive motion, and measurement of the velocity, of light; by the invention of Vernier; and the application of the pendulum to clocks by Huygens, who also brought into use the spiral spring, and made some valuable observations on the ring and satellites of Saturn; as well as by the investigations of Norwood, Horrocks, Hooke, Hevelius, Gilbert, Leibnitz, and Dominicus Cassini, to the last of whom especially the scientific world owes much. Among

a variety of other valuable observations and discoveries may be mentioned his thorough investigation of the zodiacal light, his determination of the rotations of Jupiter and Mars, and of the motions of Jupiter's satellites from their eclipses, his discovery of the dual character of Saturn's ring, and also of four of his satellites. Newton's fame rests upon his discovery of the law of gravitation, upon which the common belief is he was led to speculate by the fall of an apple. Newton announced his discovery in the *Principia* in 1687, which was briefly that every particle of matter is attracted by, or gravitates to, every other particle of matter, with a force inversely proportional to the squares of their distances. The first gleam of this grand conclusion is said to have so overpowered Newton that he had to suspend his calculations, and call in a friend to finish the few arithmetical computations that were incomplete. This discovery is perhaps the grandest effort of human genius of which we have any record. Newton also made the important discovery of the revolution of comets round the sun in conic sections, proved the earth's form to be an oblate spheroid, gave a theory of the moon and tides, invented fluxions, and wrote upon Optics.

While the foundations of physical A. were thus broadly laid by Newton, Flamsteed—the first astronomer royal at Greenwich, to whom, until recently, scant justice has been done—and Halley were greatly improving and extending the practical department of the science. To the former we are indebted for numerous observations on the fixed stars, on planets, satellites, and comets, and for a catalogue of 2884 stars. His *Historia Cælestis* formed a new era in sidereal A. Dr. Halley, who succeeded Flamsteed as astronomer royal, discovered the accelerated mean motion of the moon, and certain inequalities in Jupiter and Saturn, but he is most famed for his successful investigations into the motions and nature of comets. His successor was Dr. Bradley, who, in the year of Newton's death, made the important discovery of the aberration of light, which furnishes the only direct and conclusive proof we have of the earth's annual motion. To him also we are indebted for our knowledge of the nutation of the earth's axis. He was, besides, an unwearied observer, and left behind him at his death upwards of 60,000 observations. Altogether, Bradley's is deservedly one of the most honoured names in modern A. Dr. Maskelyne, who was appointed to the observatory after Bradley, originated the *Nautical Almanac*.

Merely to mention the names of men who from the death of Bradley to the present time have added, by theory and practice, to our knowledge of A., would extend this synopsis much beyond the limit necessarily assigned to it. If the 18th c. opened with lustre derived from the physical demonstrations of Newton, it closed magnificently with the telescopic discoveries of Sir William Herschel, who added to our universe a primary planet (Uranus) with its satellites, gave two more satellites to Saturn, resolved the milky-way into countless myriads of stars, and unravelled the mystery of nebulae and of double and triple stars. Laland, Lagrange, Lacaille, and Delambre, in the latter half of the 18th c., did much by their researches and analyses to systematise and improve the science of A. The instrumental means of observation were also, during that time, brought to high perfection. Laplace, in his great work the *Mécanique Céleste* (1799—1808), gave what further proof was needed of the truth and sufficiency of the Newtonian theory.

The 19th c. opened with the discovery of the four small planets—Ceres, in 1801, by Piazza; Pallas and Vesta by Olbers—the former in 1802, and the latter

in 1807; and Juno, by Harding, in 1804. In 1845 Hencke discovered the fifth of this group revolving between Mars and Jupiter, to which the name of Astræa was given; and up to the present time (1870), upwards of 109 planetoids (q.v.) have been discovered. The greatest event of the century has been the discovery of the planet Neptune in 1846.

Observations upon Uranus had shewn the motions of that planet to present great irregularities, which could not be explained by the action of Jupiter and Saturn; and after carefully examining the analytical theory of Uranus, Leverrier, a young academician of France, in the summer of 1846, published the elements of an undiscovered planet, the cause of the perturbations. He boldly predicted its existence, calculated its mass, and referred to its place in the heavens; and scarcely a month afterwards, on the 23d of September, the hitherto concealed object (Neptune) was found by M. Galle of Berlin. But it has only been by accidental circumstances that France has the honour of this remarkable achievement. Mr. Adams of Cambridge had arrived at results more perfect than those of Leverrier, and had communicated them to Mr. Challis, professor of A. at Cambridge, in September 1845, a year before the discovery of the planet, and nearly a year before the publication of Leverrier's final calculations. Mr. Challis, it appears, commenced a search for the planet on July 29th, and on August 4th and 12th, he actually seized the planet, and recorded two positions of it, but did not recognise it, through not comparing his observations, which a pressure of occupation, and an impression that the discovery required a much more extensive search, prevented. But for this, and the non-publication of the Cambridge mathematician's results at the time they were forwarded to Mr. Airy in October 1845, the honourable position of M. Leverrier would have been occupied by Mr. Adams, and that of M. Galle by Mr. Challis.

Astronomical discovery has made very remarkable advances during the last decade. A vast addition has been made to the number of asteroids. Photometric analysis has been applied to the measurement of the light of the sun and stars, and the spectroscope has been employed in determining their composition with very promising results, and the approximate rate of motion in space of some of the hitherto esteemed fixed stars has been ascertained by the same method. More accurate methods of recording observations have been devised, and the field of practical astronomy is continually enlarging and extending into those of the cognate sciences.

ASTUR. See FALCONIDÆ and GOSHAWK.

ASTURIAS, a northern province of Spain, bounded on the E. by Santander, on the S. by Leon, on the W. by Galicia, and on the N. by the Bay of Biscay. The low hills of Leon and Old Castile rise gradually to the mountain-chain which forms the south boundary, and towers to a height of about 11,000 feet in the summit *Peña-de-Peñaranda*. The main road from Leon to Oviedo passes over the mountain-chain at Pajares. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The summits of the mountains are covered with snow even as late in the year as August. The climate is damp; clouds hang almost continually about the peaks, gathering to them the fogs of the Atlantic. From the mass of calcareous rock, marble crags rise from 200 to more than 400 feet. The principal kinds of wood are oak, chestnut, silver and Scotch firs. Some of the forests in the remoter districts are very superb. Alpine pasture decks the slopes, and a richer covering of green,

is found in the narrow valleys. In the wider valleys, the soil yields barley, wheat, maize, figs, olives, grapes, oranges. The coasts have good fisheries. The chief minerals of the province are copper, iron, lead, cobalt, arsenic, antimony, and coal. The pasturage of the higher valleys supports an excellent breed of horses, with numerous horned cattle.

A. was never firmly occupied by the Arabs, but afforded a place of refuge to the Goths in the 8th c. Here the famous Pelayo was made king in 718 A.D.; and his successors, after contending successfully against the Arabs, were made kings of Leon, in the 10th c. The Asturian still boasts of his independence as a free hidalgo, and is simple in manners and brave, but less industrious and sociable than his neighbours in Biscay and Galicia. Many Asturians leave their province to seek a livelihood in other parts of Spain, and after saving money, return to dwell among their native hills and valleys. They have been termed the Swiss of Spain; and they are equally faithful and fond of money. Among them, the *Vaqueros* form a distinct caste, intermarrying among themselves, and leading a nomadic course of life, spending the winter on the sea-coast, and the summer on the hills of Leytariagos. OVIEDO, the capital of A., has, since 1833, given its name to the whole province. The other considerable towns are the ports Gijon and Aviles. The whole area of A. includes about 2148 square miles, with a population in 1864, of 571,335.

The eldest son of the Spanish king has the title of Prince of A., professedly an imitation of the English Prince of Wales, having been taken at the solicitation of the Duke of Lancaster in 1388, when his daughter married the eldest son of Juan I.

ASYLUM, a place of refuge. In ancient times, sacred places, especially the temples and altars of the gods, were appointed as asylums to which criminals, as well as persecuted individuals, might flee for refuge; and to molest them in such places was regarded as an impiety. An analogous institution is found in the laws of the Jews as described in the 35th chapter of Numbers, where six 'cities of refuge are appointed for persons guilty of manslaughter. Among the Greeks in early times, these asylums might be sometimes useful in preventing hasty retribution; but in the course of time they were so much abused that their sanctity was in a great measure disregarded. Thus Pausanias, who fled to the altar of Minerva, was taken and slain there by the Lacedæmonians, and in other cases the refugee was compelled to leave the A. by fire or starvation. In Rome, the Emperor Tiberius abolished all such places of refuge from law, excepting those in the temples of Juno and Esculapius. The custom of allowing to real or supposed criminals a place of safety in temples, was also adopted by the Christian Church. In the time of Constantine the Great, the churches were made asylums; and Theodosius II. extended the privilege to all courts, alleys, gardens, and houses belonging to the church. In 681 A.D., the synod of Toledo extended the privilege of A. to a space of 80 paces around every church. In the lawless periods of the middle ages, the influence of the church often prevented deeds of gross injustice and violence; but the sanctity of churches was abused by criminals; and this led to several modifications which gradually destroyed the privilege of Sanctuary (q. v.). In England, it was abolished by acts passed in 1534 and 1697. The word A. is now applied to places of shelter for unfortunate or destitute persons, and especially to hospitals for the insane. See LUNACY.

ASYMPTOTE (Gr. not coinciding), a line that

approaches nearer and nearer to some curve without ever meeting it. An example of an A. will be seen under HYPERBOLA. As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line, and draw a perpendicular reaching to any

Asymptote.

distance, D, beyond the line; set off any equal distances, E—1, 1—2, 2—3, &c., along AB; and draw C1d, C2d', C3d'', &c., making 1d, 2d', 3d'', &c., equal to ED. Now, it is evident that each of the points d, d', &c., is nearer to the line AB than the one to the left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoid*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB; for a line drawn from C to any point in AB, however distant that point, must, when produced, cross AB. AB is thus an A. to the curve. To the senses, indeed, the curve and line soon become one, because all physical or sensible lines have breadth. It is only with regard to *mathematical* lines (see LINE) that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented.

ATA'CAMITE, an ore of copper, found as a crust on the lavas of Vesuvius and Etna, especially on those of Vesuvius erupted in the years 97, 1804, 1820, and 1822. It occurs abundantly in some parts of South America, as at Atacama in Peru, from which it derives its name; at Remolinos, Santa Rosa, and other districts in Chili; and at Sarapaca in Bolivia, where it is associated in veins with ores of silver. The natural varieties of A. are crystallised, massive, and pulverulent or granular. The massive or compact variety is usually reniform, with a fibrous structure. The crystals are short and needle-shaped; the primary form is a rhombic prism. It has been sometimes described as a chloride of copper, but incorrectly; and sometimes as a hydrochlorate (muriate) of copper; it is rather to be regarded as a combination of protoxide of copper with chloride of copper. It is a rich and productive ore, containing about 55 to 60 per cent. of copper. The percentage composition of various specimens of A. is as follows:

	Copper Protoxide.	Muriatic Acid.	Water.	Total.
Compact atacamite,	72.0	16.3	11.7	100
	76.5	11.0	12.5	100
Sandy atacamite, "	70.5	11.5	18.0	100
Crystallised atacamite,	73.0	16.2	10.8	100

A. often forms on the surface of copper exposed to the air or sea-water; and the greenish incrustation observed on antique bronze utensils, weapons, and other articles, and commonly known as the *æruugo nobilis*, is composed of this salt. On some antique bronzes from Egypt the A. is crystalline. Atacamite is worked in South America as an ore of copper; and considerable quantities are sent to England to have the metal extracted therefrom. See COPPER.

ATAHUALPA, the favourite son of Huayna Capac, Inca of Peru, who died in 1525, about seven years before Pizarro's arrival in Peru. The mother of A. not being of the pure Inca blood, her son was formally excluded from inheriting the throne; but his handsome figure, bold spirit, and quick intelligence so won upon the affection of his father, that on his death-bed he declared it to be his will that A. should receive as his portion the ancient kingdom of Quito (recently conquered), while Huascar, his eldest son, should possess Peru. For five years the brothers lived on terms of real or apparent friendship; but at length the restless ambition of A., who was constantly aspiring to new conquests, excited the uneasiness of Huascar, who, in an evil hour, was induced to send an envoy to his brother, with instructions to require him to render homage for his kingdom of Quito. A. fired at the proposal, and war was instantly declared. Placing himself at the head of the army of veterans which his father had left him, he invaded Peru, and in the spring of 1532 completely defeated Huascar on the plains of Quipaypan, in the neighbourhood of Cuzco, the native Peruvian metropolis, only a few months before the arrival of the Spaniards. Huascar was taken prisoner, and confined in the strong fortress of Xauxa. Then followed, according to Garcilasso de la Vega, a series of atrocious massacres of all in whose veins ran the blood of the Incas; but his statements are so monstrous, and possess so little congruity, that they are rejected by Prescott as intrinsically incredible. In the meantime, the Spaniards had disembarked at Tumbes; and after a long, brave, and perilous march through the unknown country, Pizarro, at the head of his two hundred cavaliers, approached the victorious camp of A., where he found some fifty thousand men assembled. By a daring but diabolical stratagem, Pizarro obtained possession of the person of the king, who had come to visit him in a friendly spirit. While a priest was explaining the Christian religion, and the power of the pope over all the kingdoms of the earth, and how the pope had presented Peru to the Spanish monarch, in whose name they had come, A., indignantly interrupting him, told him that the pope (whoever he was) must be a crazy fool to talk of giving away countries which were not his own. When he inquired on what authority such claims were made, the priest pointed to the Bible, on which A. dashed the book on the ground, and the fields began to fill with Indians. The moment was critical. The crime which Pizarro had resolved upon the night before must be executed then or never. He waved a white scarf, which was the signal agreed upon. The mysterious artillery poured sudden death into the terrified masses of Peruvians, while the Spanish cavalry rode them down with merciless fury. Confusion seized the natives; they submitted—being unarmed—to this horrible butchery, only anxious to save their sacred Inca; but all their efforts to accomplish this proved unavailing, and after exhausting hours in the miserable work of murder, the inhuman Spaniards succeeded in capturing him. A. was treated with a great show of kindness at first, and more especially when he offered, as a ransom, 'not merely to cover the floor, but to fill the room in which he stood with gold as high as he could reach.' When A.'s brother, Huascar, who was still a prisoner, heard of this, he offered still more advantageous terms for himself. To prevent this, A. had him secretly assassinated. The golden treasure which was to constitute the ransom of A. now began to pour in, and at length A. demanded his freedom. This Pizarro refused to grant, and accused A. of plotting against him. The result, after much base treachery on the part of the

Spaniard, was a mock-trial, in which A. was condemned to be burned. On the 29th of August 1533, he was led to the stake, but on agreeing to be 'baptised,' his sentence was commuted to death by strangulation.

ATALANTA, a mythical personage, the daughter of Jasus and Clymene, was born in Arcadia, and celebrated as a huntress, well skilled in the use of the bow and arrow. Her father, who had wished a son, exposed her, while an infant, on Mount Parthenios, where she was found near the entrance of a cave by hunters, who are said to have brought her up, and afterwards restored her to her parents. While living as a wild mountain-maiden, she slew the centaurs Rhœcus and Hylæus. Afterwards, she sailed with the Argonauts (q. v.) to Colchis, and took a prominent part in the chase of the Calydonian boar (q. v.). She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length she was conquered by a trick of one Meilæon, whom she was compelled to marry. He obtained from Venus a gift of three golden apples, which he successively dropped in the race; and A. was so charmed by their beauty, that she could not refrain from stooping to gather them, and so lost.—Mention is made of another A. in Greek antiquity, to whom a different parentage is assigned, but regarding whom the myth is essentially the same.

ATARAIPU', a term signifying *Devil's Rock*. It is applied to one of the most singular eminences in the world, a granite pyramid in British Guiana, which rises abruptly from the plain about 900 feet, wooded for rather more than one-third of the height, but bare thence to the peaked summit.

ATCHAFALAY'A, a branch of the Mississippi at its delta. It forms so large an angle with the main river, that, after a course of only 130 miles, it enters the Gulf of Mexico, 120 miles to the west of New Orleans. From the Red River, which enters the Mississippi just above its own point of departure, the A. had received so much drift-wood, as formed at last a stationary raft 10 miles long, 220 yards broad, and 18 feet deep—an obstacle to navigation which the state of Louisiana required four years to remove.

ATCHEE'N, or ACHEE'N, the capital of a nearly extinct independent kingdom of the same name in the north-west of the large island of Sumatra, is situated on a river a few miles from the sea, and surrounded at a distance by ranges of hills. Lat. 5° 35' N., long. 95° 45' E. Pop. uncertain. The entrance from the sea is rather dangerous, as a bar stretches across the delta, and, at best, is only possible for small-craft, so that the trade which it carries on with Singapore and a few other places, in camphor, benzoin, betel-nut, pepper, sulphur, cotton cloth, and gold-dust, is inconsiderable. A. has a pretty look, a short way off, on account of the houses, which are separate, being girt in many cases with a luxuriant fringe of trees, while the environs are beautifully adorned in the same way.

ATCHEVEMENT is a term nearly equivalent to armorial bearings, and is often used when speaking of the arms of a deceased person as displayed at his funeral or elsewhere. In this sense it is more commonly used in its abbreviated form of Hatchment (q. v.).

A'TÉ, according to Homer, the daughter of Jupiter—or of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Jove, whom she

had incited to take an oath of which he subsequently repented. She then travelled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence upon mankind. But her steps were followed by the goddesses *Litai* (prayers), benevolent daughters of Jove, who healed those who had been afflicted by A. The tragic writers describe A. as the goddess of retribution. Their representations almost identify her with NEMESIS and ERINNYES.

ATELES (Gr. incomplete), a genus of American monkeys, of the division with long prehensile tails, to which the name *SAPAJOUS* (q. v.) is sometimes collectively applied. In the genus A., the head is round, and the facial angle about 60°; the limbs are remarkably long and slender, upon which account the English name *SPIDER MONKEY* (q. v.) is sometimes used as a generic designation; and the forelimbs are either entirely destitute of a thumb, or have a mere rudimentary one, a peculiarity in allusion to which the name A. was given. The name *Coaita* or *Quata* is frequently given to some of the species of A., but is sometimes limited to *A. Paniscus*, as *Spider Monkey* sometimes is to *A. arachnoides*. One of the best known species is the *Marimonda* (*A. Belzebub*), a common monkey of Guiana, and which occurs in immense numbers on the banks of the Orinoco.

ATELIERS NATIONAUX, or NATIONAL WORKSHOPS, a term under which such institutions became renowned in connection with the French revolution of 1848. In almost all countries and ages, there have been projects for organizing labour under public authority, designed generally for the benevolent purpose of obviating the distress caused by casual depressions in trade. However distinctly the laws of political economy were laid down on the point, it could always be said that these were merely theoretic, and therefore this one instance of practical experiment, however calamitous in its day, left behind it a valuable lesson. The principles of political economy on this matter are—that competition only can fix the extent to which labour is required in any department, and the rate at which it must be remunerated; that it is this competition which gives the workman a stimulus to labour effectively and profitably; and that if this stimulus were withdrawn, and all were paid alike, whether they worked well or ill, all would work ill, the public would be losers, and the large fund out of which labourers are supported under the competitive system would cease to exist. Immediately on the formation of the Provisional Government in February 1848, a permanent department was established, called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine that all workmen were entitled to have a living provided for them on a certain uniform scale. They did not forcibly abolish private employment, but they held out inducements which made workmen leave and employers break up the existing establishments. Consequently, nearly all the Parisian workmen threw themselves on the government, and others flocked in from other quarters in alarming numbers. It was found that these crowds of men, who claimed the privilege of employment by the state, had very little idea of the duty of working, even were there distinct employment for them. But when the body had increased to considerably above a hundred thousand, the government found that they had this ever-increasing mass to feed, and nothing to feed them with, since trade thus meddled with was in reality ruined. It was consequently found necessary to put an end to the system, and the result was the bloody battle of Paris, which brought about the restoration of despotism. One incidental experiment will perhaps best

explain the ruinous tendency of the whole system. In the *Hôtel Clichy*, 1500 tailors were assembled to make uniforms for the new *garde mobile*. The men were to receive among them for the completed work as much as an army-contractor would have demanded. In the meantime, they were paid two francs a day of subsistence money; the rest was to be divided among them at the end. The men were buoyed up with the notion that they were to receive not only their own proper wages, but the indefinite and enormous sum which they supposed to form the profit of the contractor, forgetting that such profit seldom exceeds about 3 per cent. Their disappointment was great when they found nothing to divide. There was, in fact, a loss. When paid their two francs—not much more than half what they obtained when employed by a contractor—they were paid more than the value of their labour and the profit of the transaction to boot. The reason is pretty obvious. Each man working for himself, and paid for his work on the competitive system, exerted himself; but when one man's exertions went virtually for nothing, unless he got the 1499 others to exert themselves to the same amount, all were alike lazy.

ATELLA N.E. *Fabulæ Atellanae* (also styled *Ludi Osci*), a kind of popular drama in Rome, first introduced from Atella, a town in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabulæ Atellanae* were still retained as interludes and after-pieces. They are not to be confounded with the Greek satiric drama, although the character of both was to some extent the same. In the latter, satyrs figured; while the former personated real Oscan characters. The *Macchus* and *Bucco* of the *Fabulæ Atellanae* may be considered the origin of the modern Italian arlecchino (harlequin), and other characters of the same stamp. They were the favourite characters; spoke the Oscan dialect, and excited laughter by its quaint old-fashioned words and phrases. The A. were neither so dignified as the *comædia prætexitata*, nor so low as the *comædia tabernaria*, but indulged in a kind of genial and decent drollery. The caricature was at first always pleasant, and though quizzical, it did not lapse into obscenity, like the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing *caste*, were allowed to take parts in the A. A few fragments of these popular farces have been collected by Bothe in his *Poetorum Latinorum Sceniorum Fragmenta* (Leip. 1834). See also Munk, *De Fabulis Atellanis* (Leip. 1840).

A TEMPO (Ital.), in time. A term used to denote that, after some short relaxation in the time, the performer must return to the original degree of movement.

A TEMPO GIUSTO (Ital.), in correct time. A term used to denote that, after a recitative, the performer should keep the music true and correct, which, during the recitative, had been altered to suit the action and passion of the scene.

A'TESHGA (the Place of Fire), a spot on the peninsula of Apsheron, on the west coast of the Caspian Sea. It is considered sacred by the Guebres, or Persian Fire-worshippers, who visit it in large numbers, and bow before the holy flames which issue from the bituminous soil. It is about a mile in diameter, and from its centre, in clear dry weather, creeps forth a blue flame (caused by the ignition of the naphtha), which shines with great brightness by night.

ATEUCHUS. See BEETLE and SCARABEUS.

ATH, or AATH, a strongly fortified town in the province of Hainault, Belgium, situated on the Dender, in lat. 50° 36' N., long. 3° 46' E. It has an

arsenal, hospital, and college, and important manufactures of linen, calicoes, lace, gloves, cutlery, large hammers, &c., and carries on a brisk trade. Pop. 10,000. The ancient church of St. Julien in A. is noted for its extraordinarily high tower. The town has been several times besieged and taken: in 1697, by Catinat and Vauban; in 1706, by the allied forces under the Dutch general Owerkerke; in 1745, by the French, after a short siege; and in 1792, by the forces of the Republic under Berneron.

ATHABASCA, a river and lake in the north-west of America, forming part of the great basin of the Mackenzie, and lying, therefore, beyond the Hudson's Bay Territory, properly so called. The river rises in the Rocky Mountains near Mount Brown, the highest point in the range. Its actual source is the small lake, already mentioned under the head of AMERICA as the Committee's Punch Bowl, which sends its tribute at once through the A. to the Frozen Ocean, and through the Columbia to the Pacific. Its general course is north-east, till, after passing through A. Lake, or rather crossing its west end, it turns towards the north-west, and, after a course of 30 or 40 miles, unites with the Peace River, from beyond the Rocky Mountains, to form the Slave River, which, again, after passing through Great Slave Lake, takes the name of the Mackenzie.—Lake A. receives nearly all its waters from the A. river, and is probably unique in this, that its principal feeder traverses not its length but its breadth, and that not in its middle, but at its extremity. The lake's single outlet is the river A. The lat. is about 59° N., and the long. between 106° and 112° W., the length 230 miles, and the average width 20.

ATHALIAH, the daughter of Ahab, king of Israel, married Jehoram, king of Judah, who died 885 B. C. After the death of her son Ahaziah, who succeeded him, but reigned for only one year, she paved her own way to the throne by putting to death (as she supposed) all the seed-royal. 'But Jehosheba, the daughter of king Jehoram, sister of Ahaziah, took Joash, the son of Ahaziah, and stole him from among the king's sons, who were slain.' The young prince thus rescued was privately educated in the temple, and, after A. had reigned six years, the high priest Jehoiada placed Joash on the throne (878 B. C.). A., hearing the noise attending the coronation, hastened to the temple, where the people were shouting, 'God save the king!' As she looked around in astonishment on the young king, whom she had supposed to be dead, surrounded by priests, Levites, rulers, captains, and a rejoicing multitude, she 'rent her clothes, and cried, "Treason! treason!"' By the command of the high priest, she was led out of the temple, and slain in the gateway of the palace. The house of Baal, with its altars and images, was broken down. This narrative (2 Kings xi.; 2 Chronicles xxi. 6, xxii. 10—12, xxiii.) is the subject of Racine's drama, *Athalie*.

ATHANARIC, a king of the Western Goths, whose settlements lay on the north bank of the Lower Danube, in the 4th c. Having taken advantage of the weakness of the Roman empire when the imperial armies were engaged in suppressing the rebellion of Procopius, war was declared against him by the Emperor Valens. A. acted strictly on the defensive during two campaigns, in which the Romans gained no advantage over him; but in the third year of the war (369 A. D.), he hazarded a general battle, and was defeated, whereupon he sued for peace, and, with that object, had a conference with Valens in a boat on the Danube. Peace was concluded, and A. had his attention occupied in

settling dissensions arising out of the Arian controversy which then agitated his people, when the first advance of the Huns on Europe alarmed the Gothic nation. A. attempted to secure the eastern borders of his kingdom; but the Huns forced the passages of the Dnieper, defeated the Goths, and advanced in great force into the plains of Dacia. When, in 374, the Western Goths were received by the Romans, as allies, and had settlements granted them on the south of the Danube, A., with a part of his people, refused to accompany them, removing to the West, and fortifying himself against the new enemy. In 380, however, he was obliged to retire, when he accepted the hospitality of the Empire, and removed to Constantinople, where he met with a cordial and honourable reception by the Emperor Theodosius. At this time died Fritigern, the king of the Goths that had settled on the south of the Danube; and A. being made king of the whole Western Gothic nation, concluded a treaty of peace, in behalf of the whole, which had the effect of incorporating that people with the other subjects of the empire. He died at Constantinople in 381.

ATHANASIAN CREED, the third of the three œcumenical symbols, derived its name from its composition being attributed to Athanasius; it is also known, from its initial words in Latin, as the creed *Quicumque Vult*. The first part of this creed contains a detailed exposition of the Trinity; the second, the doctrine of the incarnation. Modern criticism has called in question the title of Athanasius to be considered the author of this creed. It was known as early as the beginning of the 6th c., but not under its present name. It is spoken of as 'Athanasius's Tract on the Trinity,' in some Articles of the middle of the 8th c., and is supposed to be alluded to, 'as the Faith of the holy prelate Athanasius,' in the Council of Autun, about 670. Athanasius himself makes no mention of this creed, although its doctrines are essentially his; nor do any of the church fathers. Other two circumstances speak against its authenticity: it is in Latin, and Athanasius wrote in Greek; the expressions, again, are different from those used by Athanasius in speaking of the same things. By Protestants, therefore, and even by most Catholics, its Athanasian origin has been given up, and its production has been assigned with most probability to the 5th c., and to Gaul; Hilary, Archbishop of Arles (about 430), being conjectured to be the author. The title of Athanasian probably became attached to it during the Arian controversy in Gaul, as being an exposition of the system of doctrine which was opposed to the Arian system, and which would naturally be called Athanasian from its chief propounder. It was received into the public offices of the Gallic Church in the 7th c., and by the middle of the 10th c., it was adopted at Rome and all over the West. In Britain, it was probably in use as early as 800. The Greek Church was late in receiving it, and even then not without altering the article concerning the 'Procession of the Holy Ghost.' The Reformers adhered to the A. C., and Luther called it 'a bulwark of the Apostles' Creed.' Even those churches that do not in any way acknowledge it as a symbol (as the Presbyterian Churches of Britain and America, as well as the Independents) generally accept its doctrines.

The A. C. is the most rigid and intolérant of the three Catholic symbols, and has given rise to much controversy; and though still generally received by Protestants as well as Catholics, the regard once had for it has declined. The points in this creed that give offence to some are defended by others, on the plea that it was not drawn up for the sake of gratuitously dogmatising on abstruse speculative

truths, but to counteract other dogmas which were held to be dangerously heretical. Waterland, in his *Critical History of the Athanasian Creed*, says: 'The use of it will hardly be thought superfluous so long as there are any Arians, Photinians, Sabellians, Macedonians, Apollinarians, Nestorians, or Eutychians, in these parts.' (See Articles under these heads.) With respect to what are called the 'damnatory clauses' (the clauses, namely: 'Which Faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly;' and: 'This is the Catholic faith, which except a man believe faithfully, he cannot be saved'), the churches which adopt the creed do not mean by them to imprecate curses, but to declare, as a logical sequence of a true faith being necessary to salvation, that those who do not hold the true faith are in danger of perishing; as it is said, Mark xvi. 16, 'He that believeth not shall be damned.' These clauses are also held to apply to those who deny the substance of the Christian religion, and not infallibly to every person who may be in error as to any one particular article. A rubric to this effect was drawn up by the commissioners appointed in 1689 for the review of the English Common Prayer Book, but none of their suggestions took effect. Compare also the 18th Article of the Church of England with these clauses.

ATHANASIUS, Primate of Egypt, was born in Alexandria about the year 296 A.D. There are no particulars on record of his lineage or his parents. Alexander, then officiating as primate or patriarch of Alexandria, brought him up in his own family, and superintended his education, with the view of his entering on the Christian ministry. In his youth, he often visited the celebrated hermit St Antony, and embraced for a time the ascetic life with the venerable recluse. He was but a youth and only a deacon when appointed a member of the first general council at Nice, in which he distinguished himself by his erudition and his eloquence.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. A., it is said, refused on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the Emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. His sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Treves. In 338, Constantius, now Emperor of the East, though unfriendly to the principles of the Trinitarians, recalled A. from his banishment, and restored him to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by a council of 90 Arian bishops assembled at Antioch. Against this decision a protest was made by 100 orthodox bishops at Alexandria; and in a council held at Sardis, 300 bishops, with Julius, bishop of Rome, at their head, confirmed the decision in favor of A., who was again replaced in his office (349 A.D.). The Arians once more acquired the ascendancy after Constantius (in 353) had been made Emperor of both the East and the West; for in that year A. was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had

declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorites to a remote desert in Upper Egypt, where he was attended by one faithful follower. Here he wrote several works to confirm orthodox Christians in their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and A. returned to his former position as Patriarch of Alexandria (361 A.D.). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life, he was compelled again to flee from Alexandria, and remained concealed in the Theban desert until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the Emperor Valens. A. now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

A. was the leading ecclesiastic in the most trying period of the history of the early Christian Church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as an ornament of the age, as well as the most influential public character in matters of religion. Though twenty years of his life were spent either in exile, or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertions with complete success. He was a clear thinker, and as a speaker, was distinguished for extemporaneous precision, force, and persuasiveness.

His writings are polemical, historical, and moral; all marked by a style simple, cogent, and clear. The polemical works treat chiefly of the doctrines of the Trinity, the incarnation of our Saviour, and the divinity of the Holy Spirit.

The earliest edition of the collected works of A. in the original Greek appeared in two volumes, folio, at Heidelberg in 1600. It was accompanied with a Latin translation. The most complete edition is that published at Padua, in 1777. A.'s Four Orations against the Arians, and his Oration against the Gentiles, were translated by S. Parker (Oxford, 1713); also, his Treatise on the Incarnation of the Word was translated by W. Whiston, forming part of that gentleman's *Collection of Ancient Monuments Relating to the Trinity and Incarnation*, London in 1713. The Epistles of A. in defence of the Nicene Creed, and on the councils of Ariminum and Seleucia, together with his first Oration against the Arians, were translated, with notes, by the Rev. John Henry Newman, Oxford (1842).

ATHEISM, a word of modern formation, from Gr. *atheos*, 'without God,' signifies the doctrine of those who deny the existence of a God. The term atheist conveys such terrible associations to almost all minds, that there is perhaps no reproach from which men shrink more; and yet it has been freely applied by the zealous of all ages to those whose notions of the invisible powers differed from their own. The imputation is the most damaging that can be made, and it requires only a little ingenuity to make out a case of *constructive* A. from any set of opinions at all differing from the common. Thus, the ancient Greeks accused some of their philosophers

of A. though they did not deny the existence of a divinity, but only rejected the common notions of a plurality of gods. And in the Christian Church, after the doctrine of the Trinity, had been fixed and defined, those that denied the divinity of Christ were not unusually branded as atheists.

The horror inspired by this name is strikingly shewn in the way it is repudiated by the adherents of pantheism (q. v.), who reject a personal god, and substitute the idealised principle of order that pervades the universe. It is hardly to be denied, however, that the idea associated with the word God has hitherto involved personality as its very essence; and except for the purpose of avoiding odium, there could be little propriety in retaining the word when the notion is so completely altered.

The view of those who, like Kant, believe it impossible to *demonstrate* satisfactorily the existence of God, though it must be held on other grounds, is called *speculative A.*, in opposition to the *dogmatic A.* of those who attempt to disprove that existence.

A'THELNEY, ISLE OF, a marsh at the junction of the rivers Tone and Parret, in the middle of Somersetshire. Here Alfred, when driven from his throne, hid from his enemies, and founded, in 888, a Benedictine abbey, now entirely gone. Among the many relics found in this spot is a ring of Alfred's, preserved in the Oxford Museum. The name Athelney means 'island of the nobles,' or 'royal island.'

A'THELSTAN, the grandson of Alfred the Great, was born about 895 A. D., and was the first Saxon monarch who took the title of king of England, Alfred himself only assuming that of king of the Anglo-Saxons. He was crowned at Kingston-upon-Thames in 925, and seems, to have possessed both great ambition and high talent. It is supposed that his design was to unite in subjection to his single sway the entire island of Britain. His resources, however, were not equal to the undertaking, and he had to content himself with the acquisition of portions of Cornwall and Wales. On the death of Sigtric, king of Northumbria, who had married one of his daughters, A. took possession of his dominions. This excited the alarm and animosity of the neighbouring States, and a league, composed of Welsh, Scotch, and Irish, was formed against the English king, for the purpose of placing Aulaff, the son of Sigtric, on his father's throne. A fierce and decisive battle was fought at Brunenburgh, in which the allies were utterly defeated, and which became famous in Saxon song. After this, the reputation of A. spread into the continent. His sisters were married into the royal families of France and Germany, and he himself enjoyed the greatest influence and consideration. At home, he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and encouraged the translation of the Bible into the vernacular. He died at Gloucester on the 25th October 941, in his 47th year.

ATHENÆUM (Gr. *Athenaion*), the Temple of Minerva (Gr. *Athene*) at Athens, which was frequented by poets, learned men, and rhetoricians, who there read aloud their works.—The A. in Rome was a school or college erected, by the Emperor Hadrian, for the study of poetry and rhetoric, with a regular staff of professors. It existed for a long period. In the time of Theodosius II., it had three professors of oratory, ten of grammar, five of sophistry or dialectics, one of philosophy, and two of jurisprudence.—In modern times, the name A. has been revived as an appellation for certain literary institutions, and also as a collective title for literary essays and reviews. A. is the title of two weekly journals of literature

and the fine arts—one published in London, the other in Paris.

ATHENÆUS, a Greek *rhetor* and *littérateur*, born at Naucratis in Egypt. He lived at the close of the second and beginning of the third century. His work, entitled *Deipnosophistæ* (Banquet of the Learned), in fifteen books, but of which we possess the first two, and parts of the third, eleventh, and fifteenth only in an abridged form, is very interesting, as it has preserved for us copious fragments of old writers, and treats, in the form of dialogue, of almost all the topics of ancient Greek manners, private and public life, arts, sciences, &c. It is not a work indicative of any high ability; the author, for the most part, appears in the character of an agreeable, well-read, epicurean gentleman, excessively fond of *tit-bits*, both of scandal and cookery. He tells many stories to the disadvantage of people whom history praises; but these we are by no means bound to believe, nor, indeed, is he a man whose opinions are worth much on any subject; but as a melange of literary, social, and domestic gossip, the value of the work is unrivalled. A. appears to have read enormously; he states that he had made extracts himself from 800 plays of the middle comedy alone. But his dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius and has only achieved immortality through being a storehouse of miscellaneous information, that otherwise would have been lost to the race. The best editions are by Schweighäuser (14 vols. Strasb. 1801—1807), and Dindorf (3 vols. Leip. 1827). There is an English translation of A. in Bohn's Classical Library (3 vols. Lond. 1854.)

ATHENA'GORAS, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is one of the oldest of the apologetic writers, and is favourably known by his *Legatio pro Christianis*, which he addressed to the Emperor Marcus Aurelius in the year 177 A. D. He therein defended the Christians against the monstrous accusations of the heathen, viz., that they were guilty of atheism, incest, and cannibalism. His work is written in a philosophical spirit, and is marked by great clearness and cogency of style. We likewise possess a valuable treatise of his on the resurrection of the dead.

ATHENA'IS, an Athenian of distinguished beauty, the daughter of Leontinos the Sophist, was born about the close of the 4th c., A. D. She received from her father a superior education, being skilled in Greek and Latin literature, rhetoric, astronomy, geometry, and the science of arithmetic. After his death she repaired to Constantinople, to obtain justice for the harsh treatment to which her brother subjected her. Here her beauty and intelligence made her the favourite of Augusta Pulcheria, sister of Theodosius II., who considered that she would make an excellent wife for the emperor. In 421, A. having been baptised and named Eudocia, was married to Theodosius, and in 438, made a splendid pilgrimage to Jerusalem, bringing with her on her return, the supposed relics of the first martyr, Stephen. Afterwards, she lost the favour of Pulcheria—the real manager of affairs—and was banished from the court. She then retired to Jerusalem, where she suffered many persecutions, and died, in the odour of sanctity, 460 A. D. A. wrote an epic poem on the war of Theodosius against the Persians, and several other metrical works which have not been preserved.

A'THENS, the capital of the ancient state of Attica, is said to have been founded by Cecrops, about 1550 B. C., and styled Cecropia; but even the ancients themselves doubted this tradition. Equally

uncertain is the story that it was first styled A., in honor of Athene, during the reign of Erichthonius. The ancient citadel was situated on the top of a square craggy rock, 150 feet high, with a flat summit, 1000 feet long, and 500 broad. Gradually, as population increased, A. extended itself over the wide and beautiful plain below. This increase is said to have been occasioned by the organization of the twelve Attic tribes into a political confederacy or union by Theseus, the brightest figure that shines through the 'dark ages' of Attic history. The position of A. near the Gulf of Saronica, opposite the eastern coast of the Peloponnesus, was favourable to the acquirement of naval power. The city, which was distant four or five miles from the sea, possessed three harbours, all situated on the south-west, and connected with it by walls. The oldest of these harbours was Phalerum. It was also the nearest to the city, and accessible at all times by a dry road. The Peiræus was first used as a harbour by Themistocles. Munchia was the Acropolis of the whole rocky peninsula termed the Peiræus, and of immense importance strategically. The two last harbours were connected with the city by the famous 'long walls,' of which we read so much in Athenian history. They were forty stadia, or nearly five miles in length. Two streams flowed in the vicinity of A.; on the east side, the Ilissus, which also washed the southern part of the city; and on the west, the Cephissus, about a mile and a half beyond the walls. To the west lay Salamis, with Eleusis on the north-west, Phylæ and Decelea on the north, Marathon on the north-east, and Hymettus on the south. All along the coast rose splendid buildings.

The whole of the magnificent prospect was crowned by the Acropolis, where all the most glorious monuments of A. were assembled. First rose the Parthenon (q. v.), or Temple of Minerva, a pile which even now, after the lapse of centuries, remains among the wonders of the world. The Propylæa, all built of white marble, formed the entrance to the Parthenon. Close to it, on the north side of the Acropolis, rose the Erechtheum, the most venerated of all Athenian sanctuaries, and connected with the oldest religious history of the city. The whole of it was destroyed by the Persians, but was restored during the Peloponnesian war. Its ruins still exist, and allow us to form a very correct idea of its external form and structure. In some points, it differed from all other examples of Greek temples. But it would be tedious and unprofitable to mention in detail all those magnificent buildings which were the glory of ancient Athens. It is sufficient to say, that gods were never more superbly honoured in any land. That enthusiastic love of the beautiful which animated the Athenians, turning their religion into an art, and making worship an education in æsthetics, is nowhere so clearly visible as in their religious architecture. Their mythological faith stood daily before their eyes in monumental splendour, for almost every deity had his temple or shrine in the city. Two of the finest buildings—the Temple of Theseus, and that of Jupiter Olympus—were on the outside of the city; the first to the north-west, the second to the south. The former was both a temple and a tomb, inasmuch as it held the remains of Theseus himself. It was built about 465 B. C., and was therefore older than the Parthenon. It had the privilege of an asylum for slaves, and the large space of ground which it enclosed was frequently used as a muster-ground for the Athenian soldiery. It was built of the favourite Pentelic marble, in the Doric style of architecture, and is the best preserved of all the monuments of ancient Athens. For centuries it was a Christian church, appropriately enough dedicated to

St. George, the chivalrous hero of the 'dark ages' of Christianity, as Theseus had been of the 'dark ages' of Attic history; but is now the national museum of the city. The Temple of Jupiter, of which sixteen grand Corinthian columns are still extant, to the south-east of the Acropolis and near the right bank of the Ilissus, in size, splendour, and beauty, excelled all other Athenian structures. Immense sums of money were expended upon it from the time when it was commenced by Peisistratus, until it was completed by Hadrian, a period of 700 years. The building of it was frequently suspended, so that Philostratus calls it 'a struggle with time.' At the time the Persians sacked the city, it was fortunately only beginning to be built, and so escaped destruction. Aristotle speaks of it as a work of despotic grandeur, and equal to the pyramids of Egypt. The exterior was decorated by about 120 fluted columns, 61 feet in height, and more than 6 feet in diameter. It was 354 feet long, and 171 broad, and contained the celebrated statue of the Olympian Jupiter in ivory and gold, the work of Phidias.

Besides these wonders of art, the city contained places of interest of which the memory will perpetually remain—the Academy where Plato, whose estate lay near it, gave his lessons in a grove of plane-trees adorned with statues; tradition alleged it to have belonged originally to Academus. Hipparchus surrounded it with a wall, and Cimon adorned it with walks, fountains, and olive-groves. The Lyceum, the most important of the Athenian gymnasia, where Aristotle lectured; and, near to this the Cynosarges, where Antisthenes the Cynic expounded its 'harsh and crabbed' doctrine; the hill of the Areopagus where the most venerable court of judicature was held; and the Prytæum, or senate-house. About a quarter of a mile to the west of the Acropolis rises a low hill, which marks the locality of the Pnyx, a place of public assembly, forming a large semicircular area, bounded at the base by a limestone wall, from which projects a pedestal, carved out of the rock, and ascended by steps. This most interesting place has been preserved almost in its integrity, and, as we look around, we are carried back to the times when some six thousand Athenian citizens were here assembled, when the orator, standing upon the pedestal, could survey the Acropolis, with all its temples, the venerable Areopagus, and beyond the city, the extended plains and villages of Attica, with corn-fields, olive-grounds, and vineyards.

A., in its most flourishing period, numbered 21,000 free citizens; from which we may calculate that it contained about 200,000 inhabitants. More than two thousand years have passed over the beautiful city, and still its remains excite the admiration of the world. The Turk surrounded it with wide irregular walls, partly built out of the ruins of the old walls, and containing many fragments of noble columns. Of the Propylæa, the right wing, or Temple of Victory, was destroyed in 1656 by the explosion of a powder magazine. Six columns, with lofty arches, remain to mark the site of the opposite wing. The interior of the Parthenon was used for some time a Turkish mosque. Eight columns remain on the east of the front, several colonnades at the sides; and of the back pediment, where the combat of Minerva and Neptune was sculptured, nothing remains save the head of a sea-horse, and two decapitated female figures. Of the pediment in front, several figures belonging to the group representing the birth of Minerva are preserved in the British Museum, and justly regarded as master-pieces of ancient sculpture. Of all the statues which the Parthenon contained, only one

that of Hadrian has been preserved. Ruined as it has been, the general aspect of the Parthenon is still sublime. Of the Erechtheium (or Temple of Neptuneus Erechtheus) considerable vestiges remain, especially the beautiful female figures styled Caryatides.

The situations and vast extent of the two theatres may still be traced, though again is now grown in the arenas. All these remains belong to the Acropolis. In the city below, there are no such splendid memorials. The Horologium, or octagonal Temple of the Winds (built by Andronicus Kyrrhestes), has

been well preserved; but a few fragments found in broken walls are all that remain to tell of the splendid Gymnasium built by Ptolemæus. Beyond the city, the attention of the spectator is arrested by the sublime ruins of the Temple of Jupiter Olympus. Pedestals and inscriptions have been found here and there, sometimes buried in the earth. The sculptures on the friezes of the interior of the Temple of Theseus, representing the exploits of Theseus, have been well preserved, while the external sculptures are almost utterly destroyed. A Turkish burial-place

Temple of the Winds, Athens.

now occupies the hill where the Areiopagus held its sittings. The site of the Lyceum is indicated only by scattered stones, and a modern house and garden occupy the place of the Academy. Scarcely anything remains to shew the old magnificence of the harbours Peiræus, Phaleros, and Munychia.

It is probable that, in the time of Pausanias, many structures remained belonging to the period before the Persian war, as Xerxes, during his short time of mastery over A., would scarcely have been able to destroy more than the fortifications and principal public buildings. Themistocles, in his restoration of the city, had chiefly a regard to utility; Cimon paid attention to its decoration; but Pericles far exceeded them in the magnificence of his designs, which were too vast to be carried into effect in later times. The civilisation, spreading from A. as its centre, raised Macedon and other states into dangerous rivalry. The defeat at Chæroneia was as fatal to the fine arts as to the liberty of the Athenians. After the works at the Peiræus had been destroyed by Sulla, the naval power, and with it the whole political importance of A., rapidly declined. It is true that the city was treated leniently by its conquerors; the temples and statues were preserved from violation, and A., with all the trophies of eight centuries of greatness, remained under the Antonines; but the free national spirit of the Athenians had departed for ever, and slowly, but surely, the fine arts shared the fate of Grecian liberty. Their treasures, which had been spared by the Roman emperors, were gradually stolen away by various thievish collectors, especially for the decoration of Byzantium, or were destroyed by irreflective Christian zeal and barbarian invasion. About 420 A.D., the ancient religion and temple-service of A. had entirely disappeared; afterwards, the schools of philosophy were closed by Justinian, and Greek mythology was gradually forgotten. St. George took the place of Theseus, and the Parthenon was converted into a church. The surviving industry of A. was injured by Roger of Sicily, who removed its silk manufactures.

In 1456, A. fell into the hands of Omar, and, to consummate its degradation, under the low, sensual Turks, the city of Athene was regarded as an appanage of the harem, and governed by a black eunuch. The Venetians having captured the city in 1687, intended to carry away as a trophy the quadriga of victory from the west front of the Parthenon, but shattered it in their attempt to remove it. In 1688, A. was again delivered into the hands of the Turks, and the work of demolition now proceeded rapidly. The grand remains of antiquity were used as quarries to supply materials for all ordinary buildings, and, in the course of another century, the city was reduced to its lowest point of degradation.

Modern A. (styled by the Turks *Athina* or *Setines*) is now the capital of the new kingdom of Greece. Previous to the Greek revolution (1821), it was a provincial city of inferior importance, the seat of a Greek metropolitan bishop, and under the jurisdiction of the Turkish governor in Eubœa. In 1821, the war of liberation commenced, and the Turks surrendered Athens in the following year; but again captured it in 1826, and took the Acropolis in 1827. After this it was left in ruins until 1830, when Attica was declared united with Greece by the protocol of the London Conference. In 1831, Otho, the son of the Bavarian monarch, who had been elected to the sovereignty of the new kingdom, removed his residence from Nauplia to A. Improvements now proceeded rapidly: Turkish manners and customs disappeared; the contemptible wooden houses and crooked streets were superseded by new ones—among which the *Hermes*, *Æolus*, *Athene*, and *New Stadion* streets are conspicuous; and in 1836, the foundation of a new palace was laid. The municipal affairs of A. are now regulated by a mayor (*demarchos*) and council elected by the citizens. Besides other public institutions, modern A. has a gymnasium, a library enriched with many donations from France and Germany, and a university, where about 39 professors and tutors are

engaged. The number of students is between 500 and 600. Several interesting works have been printed in A. The French government has founded an Archaeological Institute, and several missionary societies have appointed agents here. A. has almost no trade except in walking-sticks and smoking-tubes made of the black-thorn of old Parnassus.

Political History of A.—It was the Ionic race that manifested most signally the distinguishing characters of Greek civilisation; and of this portion of Hellas, A., in the brilliant part of its history, stands out most prominently. According to tradition, its political power was first established by Theseus, king of Attica, who made A. the metropolis. Here he instituted the great popular festival of the Panathenæa, and, by encouraging settlements in the city, greatly increased its population. He divided the citizens into three classes: nobility, agriculturists, and mechanics. Until the death of Codrus in 1068 B.C., A. was governed by kings; afterwards, by archons elected from the nobility. The time of holding office was limited to ten years in 752 B.C., and to one year in 683 B.C., when nine archons were annually elected, one being called the *archon eponymus*, because the year was distinguished by his name. Here begins the authentic history of A. These archons, together with the council of nobles, afterwards called the Areiopagus, exercised the whole power of the state, and administered justice. The Athenian government was thus, like all other Hellenic governments, an oligarchy; but the changes introduced by the archon Solon, 594 B.C., though remarkably moderate, laid the foundation of that democratic constitution which was afterwards perfected by Cleisthenes. The condition of the population at the time of Solon was one of extreme suffering and discord, arising chiefly from the oppressive execution, by the aristocratic archons, of the law of debtor and creditor. This law was of old extremely harsh in Greece as well as in Rome; it assigned the debtor that could not fulfil his contract as the slave of his creditor. The great part of the soil of Attica was in the hands of the rich, and the mass of the population, who tilled the lands as tenants, were either in hopeless arrears, or already, with their families, actual slaves. Driven to desperation, the populace were ready to rise in mutiny; the oligarchy were afraid or unable to enforce the laws; and thus it was agreed to confer dictatorial power on Solon, well known for his wisdom, integrity, and sympathy with the people, and allow him to solve the problem. The disease being desperate, Solon applied the desperate remedy of abolishing existing contracts, liberating those that had been reduced to slavery, and forbidding for the future any one from pledging his own person or that of a member of his family. He next reformed the political constitution by dividing the freemen into four classes, according to the amount of their property. It was only the richer classes that paid taxes and were eligible to the offices of state; but all had votes in the assembly that elected the archons, and all sat in judgment on their past conduct, on the expiry of their year of office. The government, though still oligarchical, was thus modified by popular control. Its free operation was for some time (560—510 B.C.) interrupted by the usurpation of Peisistratus and his sons, whose *tyranny*, however, was mild and enlightened, the forms at least of the Solonian constitution being preserved.

On the banishment of the Peisistratidæ (510 B.C.), a further political reform was introduced by Cleisthenes, who extended the basis of the constitution, and rendered it essentially democratic. To Cleisthenes is ascribed the origin of the practice called *ostracism* (q. v.).

Then followed the brilliant period of the Persian war, when out of the circumstances which had seemed to threaten destruction, A. rose to the highest point of power and prosperity. Miltiades at Marathon, and Themistocles at Salamis, gained the victories which infused new courage and enthusiasm into the Greek nation. The period between the Persian war and the time of Alexander the Great, or from 500 to 336 B.C., was the most glorious in Athenian history; and in 444, Cimon and Pericles raised the city to its highest point of grandeur and beauty. But under Pericles, the beginning of a decline took place, through the decay of ancient morals and the Peloponnesian war, which ended in the capture of A. by the Lacedæmonians. After this A. retained only the shadow of its former power and dignity. The thirty appointed ministers of government were, in fact, so many tyrants supported by the Lacedæmonian army. After eight months of despotism had been endured, the tyrants were expelled by Thrasybulus, a free constitution was restored to A., and a new period of prosperity commenced. But it was not destined to endure long; a formidable foe, Philip of Macedon, now appeared in the north. The Athenians having opposed him in the Phocian war, Philip took from them several of their colonies. Then followed the defeat of the Athenians at Chaeroneia (338 B.C.), a fatal blow to Greece. A. with other states became subject to Macedon. The free spirit of the citizens was broken, and in moral character they degenerated. After Alexander's death, a fruitless attempt was made to regain their liberty. Antipater instituted an oligarchy of wealth. Soon afterwards A. was taken by Cassander, and placed under the rule of Demetrius Phalereus, who employed his power wisely and beneficially. Once more the old constitution of A. was restored by Demetrius Poliorcetes, and a short interval of independence was enjoyed, until the city was taken by Antigonus Gonatas. After liberating themselves from the dominion of Macedon, and joining the Achaian confederacy, the Athenians were so misguided as to support Mithridates against the Romans. This last error was fatal. Sulla conquered A., destroyed the port of the Piræus, and left only the appearance of liberty and independence, which entirely vanished in the time of Vespasian. Still, after the spirit of liberty and progress had departed, A. long remained safe from spoliation. The Romans, in their respect for Grecian pre-eminence in art and philosophy, and moved also by religious reverence, long regarded Athens as a captive too noble and beautiful to suffer any indignity.

A'THENS, a name applied to twenty-three places in the United States. The most important of them is a thriving town in Georgia, 92 miles to the west-north-west of Augusta. It is the terminus of a branch-railway, which joins the Georgia Central. It contains a cotton manufactory, and is the market for an extensive cotton-growing region. It is the seat also of Franklin College, a flourishing seminary of education.

A'THERINE (*Atheri'na*), a genus of small fishes, allied to the Mullet family (*Mugilidæ*), but latterly separated into a distinct family, *Atherinidæ*. The Atherines have more than twice as many vertebrae as the Mulllets; they are of a rather slender form, but few of them exceed six inches in length. They have a protractile mouth, and very small teeth; some are quite toothless. Almost all the known species, which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each flank. Some of them are much esteemed for their delicacy. They all congregate in great shoals. They abound in the Mediterranean.

One species, *A. notata*, is common on the east coast of North America; three species of *Chirostoma* represent them in the fresh waters of that continent. The *A. presbyter* is common on the coasts of Eu-

Atherine (*Atherina Presbyter*).

rope, and is sold in some of the towns of England under the name of Smelt: in Brighton and some other places it is called *Sand Smelt*. Where this fish abounds, it is often taken by anglers from the shore, biting readily at almost any bait.

ATHEROMA, or 'fatty deposit,' is generally found in the tissues of aged persons, or those who have lived dissipated and ill-nourished lives. In appearance, it is yellow and cheesy, shewing under the microscope fatty granules and crystals of cholesteroline. Its most common situation is between the middle and inner coats of arteries, and is dangerous, inasmuch as it interferes with the elasticity of the arterial tube, rendering it more liable to injury, and less able to repair itself, should any occur. A. generally precedes aneurism (q. v.). Cysts filled with contents resembling bread-sauce, which frequently occur in the scalp, are termed atheromatous tumours.

ATHLETE (Gr. *athleo*, to contend), the name given to a combatant, pugilist, wrestler, or runner, in ancient Greece. Athletics were studied in Greece as a branch of art, and led to several useful rules of diet, exercise, &c., applicable to ordinary modes of life. Bodily strength and activity were so highly honoured by the Greeks, that the A. held a position in society totally different from that of the modern pugilist. When he proposed to enter the lists at the Olympic or other public games, he was examined with regard to his birth, social position, and moral character. A herald then stepped forth and called upon any one, if he knew aught disgraceful to the candidate, to state it. Even men of genius contended for the palm in athletic exercises. Chrysippus and Cleanthes, the famous philosophers, were victorious athletes, or, at least, *agoniste*, i. e., persons who pursued gymnastic exercises, not as a profession, but for the sake of exercise, just as at the present day we have gentlemen-cricketers, amateur-pugilists, &c. The profound and eloquent Plato appeared among the wrestlers in the Isthmian games at Corinth, and also in the Pythian games at Sicyon. Even the meditative Pythagoras is said to have gained a prize at Elis, and gave instructions for athletic training to Eurymenes, who afterwards gained a prize at the same place. So great was the honour of an Olympian victor, that his native city was regarded as ennobled by his success, and he himself considered sacred. He entered the city through a special breach made in the walls; he was supported at the public expense; and when he died, was honoured with a public funeral. Euthymus, of Loeri in Italy, who had, with only one exception, been regularly victorious at Elis, was honoured with a statue, to which, even during his lifetime, homage was paid by command of an oracle. Athletic sports were first witnessed at Rome 186 B.C. They were introduced by M. Fulvius at the end of the Ætolian war, and became excessively popular in the time of the emperors. At Rome, the athletes formed a corporation.

ATHLO'NE, a small town in the centre of

Ireland, on both sides of the Shannon, chiefly in the county of Westmeath, but partly in that of Roscommon. It is the largest town between Dublin and Galway, and lies on a commanding situation, 3 miles below Lough Ree, in a carboniferous limestone district. The chief manufactures are felt-hats, friezes, linens, and stays. A canal here, a mile long, enables large river steamers to navigate the Shannon for 116 miles, from Killaloe to Carrick-on-Shannon, uninterrupted by the rapids. The Shannon is crossed by a fine bow-string and lattice iron bridge of two arches, 175 and 40 feet span. Pop. in 1861, 5601. A. sends one member to parliament. A. Castle, on the Roscommon bank of the Shannon, was founded in the reign of King John, and has now been rendered one of the chief military positions in Ireland. The fortifications cover 15 acres, and contain barracks for 1500 men.

ATHOLE (Pleasant Land), a district of 450 square miles, in the north of Perthshire. It occupies a great part of the southern slopes of the Grampian mountains, and is intersected by many narrow glens, down which flow the rapid tributaries of the Tay. It is chiefly composed of gneiss and quartz rock, with beds of primary limestone. Dr. Hutton's explorations among the granite veins in Glen Tilt, were among the chief means of establishing the Plutonic theory of geology. A. was once one of the best hunting districts in Scotland. Athole deer-forest is said to contain 100,000 acres, and 6000 head of deer, of which 100 are killed annually. In the picturesque Pass of Killiecrankie, in this district, 17 miles northwest of Dunkeld, Claverhouse fell in 1689, though victorious over the troops of King William III.

ATHOR, or ATHYR, but properly, *Het-her*, i. e., 'the habitation of God,' the name of an Egyptian goddess who, in the mythological system of that people, is ranked among the second class of deities. She was the daughter of Ra, the sun. By the Greeks, she was identified with Aphrodite (Venus). The cow was regarded as her symbol, and, in hieroglyphics, she generally appears with the head of that animal, bearing between her horns the figure of the sun's disk. A. is also represented as a cow itself, and as a bird with human face, horns, and the sun's disk. On the oldest monuments, she is frequently portrayed bearing a temple on her head, as in the Athor-capitals of the Ptolemaic buildings, falsely supposed to be heads of Isis. Originally, the goddess had a cosmogonic significance; later, she was called the 'mistress of dance and jest,' and held in her hands, as symbols of joy, the cord of love and the tambourine. Queens and princesses were often represented by the figure of A. Her worship was generally spread through Egypt. Her most sacred abode was at Denderah. After her the third month of the Egyptian year was named.

ATHOS, HA'GION O'ROS, or MO'NTÉ SA'NTO, i. e., the Holy Hill, the principal mountain of a chain extending, in a peninsular form, from the coast of Macedonia into the Ægean Sea, between the Gulfs of Contessa and Monté Santo, and connected with the mainland by a narrow isthmus. The length of the peninsula is 40 miles; breadth, 4. According to tradition, it received its name from A., son of Neptune, or from A., a giant who battled against the gods. The highest summit in the chain, or Mount A. proper, a solitary peak at the southern extremity of the peninsula, rises 6350 feet above the sea-level. In ancient times, several towns were built on A. Herodotus mentions five. The most memorable thing in connection with A., is the canal which Xerxes cut through the isthmus, in order to escape the stormy gales which rendered the navigation round the promontory very perilous, and which

had shattered the fleet of Mardonius some years before. Traces of this canal still exist. In the middle ages, A. was covered with monasteries, of which 20 still remain (besides several hermitages, chapels, &c.). The largest are the monasteries of Ivoron and St. Laura; the richest, Vatopædi. The entire number of monks who inhabit the 'Holy Hill' is about 8000. They form a kind of monastic republic under the Turkish government, to which they pay an annual tribute of nearly £4000. The monks follow the rule of Basilus, and lead an ascetic life, engaged chiefly in agriculture, gardening, and the care of bees. In diet, they restrict themselves to herbs, fruits, and fish. They carry on a considerable trade in amulets, images, crucifixes, wooden articles of furniture—all of their own manufacture—and also reap profits from the numerous visits of pilgrims. Karyæz, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens, and has 1000 inhabitants. Here the market is held; but no female, even of the animal kind, is permitted to be present, or even to enter the peninsula. In the middle ages, A. was the centre of Greek learning and Christian-Byzantine art. Now, scarcely more than two or three monks, of tolerable education, can be found in a monastery. The libraries are neglected, though containing several beautiful old manuscripts, some specimens of which have been brought to Western Europe. They contain, however, little or nothing of value in classical literature.

ATHY', a small town in the south-west of Kildare county, Ireland, on the east side of the river Barrow, here navigable for barges. It lies in a carboniferous limestone district. It chiefly consists of two main streets. Pop. (1861) 4113. Its chief export is grain.

ATLAN'TA, a flourishing city of Fulton co., Georgia, about 7 miles S. E. of the Chattahoochee, and on the railroads from Savannah to Chattanooga and Nashville, 101 miles N. W. of Macon, 171 W. of Augusta, and 291 from Nashville. The Georgia R. R. extends from Atlanta to Augusta; the Macon and Western R. R. to Macon; the Atlantic and Western R. R. to Chattanooga, and the La Grange R. R. to West Point, 72 miles distant. It was destroyed by Gen. Sherman, Nov. 1864, but is rapidly recovering its former prosperity. Pop. in 1860, 9554.

ATLAN'TES, in Arch., so called, by the Greeks, in reference to the mythical Atlas (q. v.), are male

Atlas Column, from the Baths at Pompeii.

figures used instead of columns. The Romans called them Telamones.

ATLAN'TIC OCEAN, so called either from

Mount Atlas, or from the fabulous island of Atlantis, is that part of the ocean that divides the Old World from the New. Its extreme breadth is about 5000 miles, and its narrowest part, between Cape St. Roque in Brazil, and the nearest point in Africa, about 1600 miles. If the A. be supposed to be bounded by the polar circles, it covers an area computed at 25 million square miles. The A. is naturally divided into three portions—the north, south, and intertropical A. It stands in open connection with the north and south polar seas, and in the remarkable parallelism of its coasts, resembles rather a vast river than an ocean. Its northern half sends off numerous ramifications on both sides, some of them forming almost shut seas: on the west, Hudson's Bay, the Gulf of St. Lawrence, and the Gulf of Mexico; on the east, the Baltic, North, Mediterranean, and Black Seas. In the south, again, both coasts present a comparatively unbroken line; but there is a remarkable correspondence between their projecting and retiring angles, the convex coast of Brazil lying opposite to the Gulf of Guinea, and the projection of Sengambia answering to the retirement of the American coast in the Caribbean Sea.

The whole of the New World, with the exception of the narrow strip lying west of the Andes and Rocky Mountains, belongs to the *basin* of this ocean. It drains comparatively little of the Old World, as may be seen by tracing the water-shed on a map. Owing to the numerous seas and inlets connected with it, the extent of its shores is immense, over 50,000 miles, several thousands more than that of the shores of the Pacific Ocean and Indian Sea together. Except near the continents, the Atlantic is poor in islands compared with the Pacific. The chief islands in the open ocean are Iceland, the Farøe Islands, Bermudas, Azores, Ascension, St. Helena, the Falkland Islands, South Georgia, and Sandwich Land.

The A. is now the greatest highway of the civilised world, and everything that concerns its navigation becomes of vast importance. Under the system of observations established by Lieutenant Maury of the United States Observatory at Washington, and now co-operated in by England, much has been done, and is doing, to amass information as to its currents, winds, depth, temperature, &c. The operations connected with the Telegraph cable were also the means of furnishing us with some valuable information regarding the Atlantic. It was then discovered, from a comparison of meteorological observations extending over a long period, that the western part of what has been named the Telegraphic Plateau is exempt from gales during summer; that the eastern part is almost free in August, except on the coast of Ireland; and that there is little risk from storms in June and July. In June, fogs are of more frequent occurrence on the western than on the eastern side. Between June and August, there is less danger from ice than at any other time of the year; and, considering all things, the A. is freest from disturbing causes between the 20th of July and the 12th of August.

The chief A. currents are two. The *Equatorial Current*, which, starting from the Bay of Benin, proceeds westwards on both sides of the equator till near the coast of Brazil, where it divides, one branch running south, and the other along the coast of Guiana into the Caribbean Sea. The velocity of this current is very varied, in some places flowing at the rate of 25 miles a day, and in others, at three times the speed. Its force also varies with the months; but the mean velocity may be set down at about 30 nautical miles a day. Its breadth varies from 200 to 400 miles; and its temperature is

lower than the surrounding ocean. The other great current is the *Gulf Stream*. This issues from the Gulf of Mexico through the Strait of Florida, and after following the direction of the American coast to about 40°, turns seaward, touches the great Newfoundland Bank, and gradually curving round, is lost about the Azores. But part of its waters find their way to the British and Farøe Islands, and to the coast of Norway. The water of this stream is often upwards of 20° warmer than the surrounding ocean. Its physical identity is preserved for thousands of miles. Lieutenant Maury calls it 'a river in the ocean;' and the line of junction, even as far out from the gulf as the Carolina coasts, is so distinctly marked, that it may be traced by the eye. 'Often one half of the vessel may be perceived floating in the Gulf Stream water, while the other half is in common water of the sea; so sharp is the line, and such the want of affinity between those waters.' The Gulf Stream has an immense influence on the A. According to Lieutenant Maury's calculation, it keeps in perpetual motion one-fourth of all the waters in the ocean. Its velocity and breadth vary very considerably. The branches and fruits of tropical trees, often found on the coasts of the Hebrides and Farøe Islands, are no doubt transported by this current. See GULF STREAM. Besides these great currents, the A. abounds with smaller ones, which are as yet mysteries to the mariner. No researches that have hitherto been undertaken have enabled him to define their whereabouts and their strength and direction so precisely and accurately that he may at all times 'be certain of their help, when favourable, and sure of avoiding them if adverse.'—Speaking of under-currents, Lieutenant Maury says: 'There seems to be a larger flow of polar waters into the A. than of other waters from it, and I cannot account for the preservation of the equilibrium of this ocean by any other hypothesis than that which calls in the aid of under-currents. They, I have no doubt, bear an important part in the system of oceanic circulation.' As a means of ascertaining the force and direction of these under-currents, the same authority recommends a submarine kite, constructed on the principle of an air kite.

It is only within very recent years that the depth of the A. has been determined with anything like accuracy. Under the old system of lead-and-line sounding, enormous depths were reported. Lines 24,000 feet, 46,000 feet, and even 50,000 feet, had been run out in the South A. without discovering any bottom. The reason of this is now attributed, not to the great depth of the ocean, but to the fact that the shock caused by a weight so light as that in common use striking the bottom cannot be communicated through very great depths; and besides, the under-currents have, as a general rule, more than sufficient force to take the line out long after the plummet is at rest. Various experiments were made with a view to improve the method of sounding, chiefly by officers in the service of the United States government, and, finally, it was determined to sound with a cannon-ball of 32 lbs. (which it was thought would be of sufficient weight to give an indication when it touched the bottom) attached to sounding-twine marked every hundred fathoms, and wound on reels holding 10,000 fathoms each. As soon as the slack gave token that the ball had reached the bottom, the line was cut and the length remaining on the reel measured, the difference between that and the original length being the depth of the ocean. This plan was not perfect without various calculations as to currents, velocity of descent, &c., which have since been made, and which have rendered deep-sea soundings something

like reliable. The result is, that the ocean is not above half the depth it was formerly supposed to be. The greatest depth of the North A. yet discovered is 25,000 feet, about 4½ miles. The deepest part, in the opinion of Lieutenant Maury, is probably between the parallels of 35° and 40° N. lat., and immediately to the southward of the Grand Banks of Newfoundland. A remarkable ridge, about 400 miles wide, and 10,000 to 12,000 feet, or 2 to 2½ miles below the surface of the sea, extends along the bottom of the A. from Cape Clear in Ireland to Cape Race in Newfoundland, a distance of 1640 miles. A specimen of the nature of this plateau was brought up by a beautiful sounding apparatus, the invention of a United States officer, which detaches the sinking-weight as soon as it touches the ground, and is so contrived that it brings up specimens of the bottom along with it. When examined by the microscope, this specimen was found to be chiefly composed of little calcareous shells (*Foraminifera*). No particle of sand mingled with these shells. Lieutenant Berryman has since found in this tract obsidian, pumice, &c., forming a line of volcanic cinders 100 miles long. Upon this plateau the A. Telegraph cables were laid in 1858 and 1866.

Leaving out of account the coasts, the A. is shallowest in what the Portuguese call the *Mer de Sargasso* (q. v.), or 'Weedy Sea,' a vast tract extending from the 30th meridian to the Bahama Islands, and between the parallels of 36° N. and 19° N., densely covered in many parts with gulf-weed (*Fucus natans*). See GULF-WEED.

The bottom of the A., as shewn in a map executed by Lieutenant Maury, is a series of ridges. The first ridge nearest the shore is less than 6000 feet beneath the surface of the sea; the second ridge is reached at a depth of 12,000 feet; the third, at a depth of 18,000 feet; and the fourth, at a depth of 24,000 feet. This last ridge rises over depths yet unfathomed, between the Bermudas and the Grand Banks of Newfoundland.

In the intertropical portion of the A., the trade-winds (q. v.) regularly prevail; beyond this, the winds are variable. On an average of six years the voyage from Liverpool to New York, by sailing-vessels, takes not less than 40 days, while the return voyage is accomplished in 23 days. The difference of time out and home is entirely due to the prevalence of south-west winds in the North A.

The A. abounds with fish; herring and cod fishing forming important branches of industry in Northern Europe.

Johnston's *Physical Atlas*, and Lieutenant Maury's *Physical Geography of the Sea*, afford detailed information regarding the temperature, winds, currents, navigation, &c. of the A. O.

ATLANTIC TELEGRAPH, HISTORY OF. In 1842, Professor Morse of New York, having stretched a submarine cable between Castle Garden and Governor's Island, New York, and succeeded in transmitting an electric current from one end to the other, expressed his opinion that it would be possible to effect an electrical communication through the sea. After further investigations, he announced to the Secretary of the Treasury of the United States, 'that a telegraph communication on his plan might with certainty be established across the Atlantic.' Three years prior to that, Sir William O'Shaughnessy gave practical proof that electrical messages could be conveyed through water, by depositing a cable in the bed of the Hooghly; but it was the successful submarine telegraphic undertakings of the Messrs Brett, who, in June 1845, registered a 'General Oceanic Telegraph Company,' with the object among others of joining this country

with America by means of a telegraph 'across the Atlantic Ocean,' and six years afterwards united England with France (see *SUBMARINE TELEGRAPH*), that first fairly convinced the public mind that the New World might be put on what may be called conversational terms with the Old. The supposed great depths of the Atlantic Ocean presented the most imposing obstacle to this desired closeness of communion; but when it was discovered that between Ireland and Newfoundland there extended, along the bottom of the Atlantic, at a depth of not more than two miles below the surface, a fine broad platform (see *ATLANTIC OCEAN*), seemingly so specially formed by nature for the purpose of electrical communication, that Captain Maury at once designated it the Telegraph Plateau, the project of an Atlantic submarine cable assumed a practicable form. In 1854, the colonial government of Newfoundland passed an act incorporating a company to establish a telegraphic communication between the Old World and the New, and aided it by a subsidy, and by grants of lands. The colonial government also conferred upon the company the exclusive right of landing a telegraphic line upon the coasts under its jurisdiction. The governments of Prince Edward's Island and the state of Maine made similar concessions; and authority for certain subsidiary operations in Canada was also obtained. The company incorporated under the title of 'The New York, Newfoundland, and London Telegraph Company,' commenced operations by uniting St John's in Newfoundland with lines in the United States and British North America. This done, numerous preliminary experiments were undertaken by eminent electricians and engineers, in order to determine the amount of retarding force which inducted and disguised electricity were likely to offer to the transmission of currents along submarine wires of unusual length. Having by these experiments, 2000 in number, tried with 62 different kinds of cable, determined the one best adapted for the conveyance of electricity through such a length, and at such a depth in the Atlantic, the next step was the formation of a more influential company. In 1856, 'The A. T. Company,' to which all the privileges conferred on the old company were handed over, was formed with a capital of £350,000. The governments of Great Britain and the United States liberally aided the company, guaranteeing, by a contract of 25 years' duration, to pay to the company, until such time as its dividend reached 6 per cent., a subsidy of £14,000 a year, and of £10,000 subsequently. They also agreed to furnish ships for laying down the cable.

The cable, which weighed about a ton per mile, equal to 14 cwt. in water, was composed of a strand of seven wires of pure copper, coated with three separate layers of gutta percha, wrapped over with hemp saturated with pitch and tar, and finally bound round with iron wires, 332,500 miles of iron and copper wire being employed in its construction. It was deposited in the holds of the *Agamemnon*, a line-of-battle ship supplied by the British government, and the *Niagara*, a splendid frigate furnished by the United States, and the two vessels started on their grand mission. After two unsuccessful attempts during the years 1857 and 1858, the expedition started again for mid-ocean, whence the ships were to start, paying-out towards opposite shores, on the 17th of July 1858. The cable was united and lowered on the 29th of the same month; and the *Agamemnon*, notwithstanding a severe gale of wind, arrived at Valentia, having successfully laid her portion of it, on the morning of the 6th of August. The *Niagara* about the same time arrived in Trinity Bay, Newfoundland, and science had annihilated space

between the Old World and the New. On the 17th August, the extremities of the cable having been put in connection with the recording-instruments, the following message was flashed through the ocean in thirty-five minutes: 'Europe and America are united by telegraph. Glory to God in the highest; on earth peace and good-will towards men.' Messages and replies from the Queen to the President of the United States, from the Mayor of London to the Mayor of New York, &c., followed. But on the 4th of September, the signals at Valentia became unintelligible, and subsequently remained so. One commercial message of great importance passed through the cable, in reference to the collision between the Atlantic steamers, the *Europa* and *Arabia*; this single message saved the commercial world £50,000, which would doubtless have been spent in extra insurance on the vessels and cargoes thus delayed beyond their anticipated time of arrival. In the year 1865 an unsuccessful attempt was made to lay another cable; but in 1866 the enterprise was renewed and carried to a successful completion. For a detailed account of those expeditions see Supplement, Vol. X., Article *ATLANTIC TELEGRAPH*.

ATLANTIS, according to ancient tradition, the name of a vast island in the Atlantic Ocean. It is first mentioned by Plato, who represents an Egyptian priest as describing it to Solon, but, of course, according to Plato's view of the matter. In this description, A. appeared as an island larger than Libya and Asia Minor taken together, and lying off the Pillars of Hercules in the Atlantic Ocean. Plato gives a beautiful picture of the interior of this imaginary land, and enriches it with a fabulous history. Some early writers supposed that the Canary Islands were the remains of the old A.; for Plato had stated that at the close of the long contest which its inhabitants maintained against the Athenians, nine thousand years before his time, the sea suddenly engulfed the island, and had ever since been unnavigable, by reason of the shoals of mud created by the sunken island. Some found it in the Scandinavian peninsula; other (first Bircherod in 1685) have supposed that Phœnician or Carthaginian merchant-ships, had been driven by storm on the coast of America, and that the supposed vast Island of A. mentioned by Plato, as well as the great unnamed island spoken of by Pliny, Diodorus, and Arnobius, may have been the New World.

ATLAS is that piece of the human vertebral column which is nearest to the skull; in other words, it is the first cervical vertebra. It may be known from the other six by its being without a body or spinous process, by its being a mere irregular bony ring, partly divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the part in front being occupied by the tooth-like process of the second cervical vertebra, and that behind, by the spinal-marrow. On each side, the ring is very thick; it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

The A., with the occipital bone, forms the joint on which the head moves in bowing; and turns on the pivot of the second cervical vertebra, when we look from side to side.

ATLAS, according to Hesiod's *Theogony*, one of the Titans, the son of Iapetus and Clymene, and brother of Menœtiſ, Prometheus, and Epimetheus. Apollodorus, however, states him to have been a son of Asia, and Hyginus, a son of Æther and Gæa. He married Pleone, daughter of Oceanus (or Hesperis, his own niece), and became the father of the Pleiades. As leader of the Titans, he attempted

to storm the heavens, and for this supreme treason was condemned by Zeus to bear the vault of heaven on his head and hands—the sting of this mythological punishment obviously being, that A. was compelled to support what he thirsted to destroy. The later writers, however, rationalize the myth, and state that A. was a mighty king who had great skill in astronomy, and only tried to storm heaven intellectually.—In consequence of the ancient views which made the vault of heaven rest on solid pillars or other supports, the name A., originally mythological and cosmogonic, was introduced into geography. Mercator, in the 16th c., gave the name A. to a collection of maps; probably because the figure of A. supporting the heavens had been given on the title-pages of such works.

ATLAS, a mass of mountain-land in the western part of North Africa. Herodotus mentions a smoking mountain of this name situated on the south-west of the Little Syrtis, and, twenty days' journey westwards from the Garamantes, styled by the natives the 'pillars of heaven.' By later writers, after the time of Polybius, the name A. was always given to the chain of mountains in North-west Africa extending from the island of Cerne (now Cape de Ger) north-west through Mauritania, and Tingitana (now Fez and Morocco), and including also the heights dispersed through the region of Sahara. It is divided into the Little Atlas and the Great Atlas; the former denominating a secondary range in the country of Sous, and the other, the loftier mountains of Morocco. The A. is not properly a mountain-chain, but rather a very irregular mountainous mass of land formed into many chains running in various directions, meeting in mountain-knots, or connected by yokes, or short chains of inferior height, and diversified still further by several solitary mountains and groups of mountains. The A. attains its greatest height (13,000 feet in Morocco, the only part where it rises above the snow-line, and obtains the name of *Jebel-el-Thelj*, or *Snowy Mountains*). Its highest peaks are Mitsin—27 miles south-east of the city of Morocco—Bibawan, and Tagherain. The most southern chain diverging here from the central mass bears the name *Jebel-Haduar*. The heights approach the sea, and form the promontories jutting out into the Atlantic. From Morocco, the A. gradually decreases in height towards the east. In Algeria, the elevation is only 7673 feet; in Tunis, 4476 feet; and in Tripoli, 3200 feet. The whole mountain-system is intersected by the valley of the Mulua river, which flows through the north-east part of Morocco, and falls into the Mediterranean. The slopes on the north, west, and south are covered with vast forests of pine, oak, cork, white poplar, wild olive, &c. The valleys are well watered and capable of cultivation with great profit. The A. seems to be chiefly calcareous in its composition. The mineral wealth remains, however, almost wholly unexplored, though copper, iron, lead, antimony, &c., are stated to exist in abundance.

ATMOSPHERE (Gr. *atmos*, vapour, *sphaira*, sphere) is the name applied to the gaseous envelope which surrounds the earth. The existence of an A. is to us a matter of vital importance. We owe to its influence the possibility of animal and vegetable life, the modifying and retaining of solar heat, the transmission of sound, the gradual shading of day into night, the disintegration of rocks, and the occurrence of weather phenomena. In consequence of the action of gravity, the A. assumes the form of a spheroidal stratum concentric with the earth, and presses heavily on its surface. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condi-

tion differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance, it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment. If a hollow glass globe of 5 or 6 inches in diameter be weighed first, when filled with air, and then, after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic inches of dry air, when the barometer is at 30 inches, and the thermometer at 60° Fahrenheit, weigh 31.074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in the A. as well as in water. If a glass globe filled with air and closed, be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed, they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavouring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the A. must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely fails at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer, that in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the A. must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the A. has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal

force and the repulsive action of the particles on the other, are poised, and beyond which the latter forces on balancing the former force, the aerial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. The only result upon which dependence can be placed is derived from the mathematical data founded on the duration of twilight, which gives a height of about 45 miles.

The pressure of the A. is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the A., is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 feet, from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13·6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13·6 times less in height than the column of water, or about 30 inches. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary barometers (q. v.). A mercurial column of 30 inches in height, and 1 square inch in section, weighs 15 lbs. (more accurately, 14·73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word A. is often employed to express this weight or pressure on a square inch of surface, so that when we speak, in Mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lbs. on the square inch. The pressure on a square inch being thus ascertained, we have merely to multiply it by the number of square inches on the earth's surface to obtain the total weight of the A. It amounts to 11·67085 trillions of lbs., or about $\frac{1}{181,000,000}$ of the earth's mass. It must be observed that the height of the barometric column is not a constant quantity, as it varies with the latitude, the season of the year, and the hour of the day. At London, its mean height is 29·88 inches; at Paris, 29·92 inches. The pressure of the A. in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° N lat., and decreasing from 30° to 65°, where it again begins to rise. The greater height at 30° is said to be due to the accumulation of air at that latitude by the action of the trade-winds. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, we would expect that, during the year, the barometer would stand at a minimum in summer, and a maximum in winter. In reality, however, although the barometer is highest in mid-winter, there is another maximum in mid-summer, making thus two minima—one in spring, the other in autumn. This arises from the part which watery vapour plays in the pressure of the atmosphere. The heat of mid-summer introduces into the air a large quantity of moisture, in the form of elastic vapour, which, adding its pressure to that of the dry air, raises what would otherwise be the minimum barometric column to a higher point than that at which it stands in spring and autumn. Similar causes affect the pressure of the A. during the 24 hours of

the day. There are two maxima—one at 10 A.M., the other between 10 and 11 P.M.; and two minima—at 4 A.M. and 4 P.M. Very slight variations indicate the existence of atmospheric tidal waves; but this subject is still involved in some obscurity. The pressure of the A. exercises a most important influence on the organism of the human frame. A man of ordinary stature is exposed to a pressure of about 14 tons; but as the air permeates the whole body, and presses equally in all directions, no inconvenience is found to result from it. From experiments instituted by the brothers Weber in Germany, it has been ascertained that the heads of the thigh and arm bones are kept in their sockets by the pressure of the A.; and in balloon ascents the aéronaut often suffers from bleeding at the nose, lips, and even eyes—a fact that would seem to indicate that the strength of the blood-vessels has been adjusted with reference to atmospheric pressure.

Chemical Composition of the A.—Recent chemical researches give the following as the mean composition of 100 volumes and of 100 grains of dry air:

	Volumes.	Grains.
Nitrogen,	76·62	76·64
Oxygen,	20·94	23·10
Carbonic acid,	0·04	0·06
	100·00	100·00

Besides the substances just named, other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the A., such as ammonia and ammoniacal salts, carburetted and sulphuretted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. Roughly speaking, then, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with a slight admixture of carbonic acid, and a mere trace of several other substances. As, however, the air of the A. is never found dry, we must add to the constituents already named watery vapour, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapour varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the A. is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of ozone (q. v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the A. The nitrogen which forms the bulk of the A. possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shewn by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the A. in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table

it will be seen that 10,000 volumes of atmospheric air contain 4 volumes of carbonic acid. If it occurred in a much larger proportion, being poisonous, it would become dangerous to animal life; and if it occurred in a much less proportion, the vegetable world would lack its requisite nourishment. The other substances, of which a trace is always or only sometimes found in atmospheric air, are difficult to detect in the air itself, but are generally found dissolved in rain-water, more especially in that which has fallen immediately after a long drought. Of these, by far the most important and widely diffused are ammonia and ammoniacal salts, which are of essential importance to the vegetable economy, because, dissolved in the rain, they furnish plants with the nitrogen required by them for the production of their flowers and fruit. Nitric acid is detected in the air after thunderstorms, sulphuretted hydrogen in the tainted air of sewers and such like places, and sulphurous and sulphuric acid only in the neighbourhood of chemical or smelting works. A considerable quantity of carbonic oxide and carburetted hydrogen escapes unconsumed from our furnaces; and although the latter gas is in addition given off to the air in marshy and bituminous districts, the two occur in almost inappreciable quantity in the atmosphere.

In addition to its gaseous constituents, the A. contains solid substances in a state of exceedingly fine division, the presence of which is revealed in the sunbeam. Many of these minute particles, being the seeds of plants or eggs of animals, must exert an important influence on the organic substances on which they may finally settle, inducing in many of them the conditions of disease or putrefaction.

When the composite nature of the A. was first discovered, it was supposed to be a chemical combination of nitrogen and oxygen, but further inquiries have rendered this opinion highly improbable. When any two bodies unite with each other chemically, the substance which results, from their combination invariably possesses properties which the original constituents did not possess. Now the atmospheric union of oxygen and nitrogen is distinguished by no properties which may not be attributed individually to these gases. We have, then, in this respect, no indication that the atmospheric combination of oxygen and nitrogen is a chemical one. Again, when any composite gas is dissolved in water, the proportion of the ingredients dissolved in it is exactly the same as that in which they occur in the compound itself; but this is not the case with air dissolved in water, which is found to be richer in oxygen than atmospheric air. Now, as oxygen dissolves more readily in water than nitrogen, it is manifest that this larger proportion of oxygen arises from both gases acting independently of each other in respect to the water, a condition that would be impossible if they were in chemical union. From these and other corroborative facts, the A. is considered to be simply a mechanical combination of the gases contained in it. This, however, does not prevent the A. from having a uniform composition, as might at first sight be supposed; for when gases are mixed with each other, they entermingle thoroughly throughout the whole space occupied by them. Local causes may temporarily affect the relative proportion of the atmospheric ingredients, but the changes are so minute as to require the most delicate analysis to detect them.

ATMOSPHERIC ELECTRICITY. Franklin was the first to establish the identity of the lightning of the heavens with the electric spark. By his famous kite-experiment, he ascertained that the thunder-cloud assumes an electrical condition precisely similar to that of the conductor of an

electrical machine, and that the same mechanical and luminous effects are common, though in a different degree, to both. The attention that was first directed by this discovery to the A. E., as displayed in the thunder-cloud, has since then been extended to the electrical condition of the air in all the different states of the weather. It is now found that the air is sensibly electrical not only when the sky is overcast with thunder-clouds, but when the weather is clear, or when no thunder-clouds are present. The observations of A. E., in the latter circumstances are made by means of very delicate electroscopes (q. v.). These instruments are constructed for being used either alone in the open air, or in a room, in conjunction with an apparatus on the roof of the house for collecting the electricity. The following are some of the results derived from these observations: When the sky is clear and free from clouds, the A. E. is always positive, and an electroscope exposed to the action of the air is charged with positive electricity. On the other hand, the electricity of the ground is found to be negative. This was shewn in a very ingenious way by Volta, who, by catching the fine spray of a fountain on the plate of a straw electroscope, found the straws to diverge with the negative electricity communicated to them by the water, which was necessarily of the same character as that of the ground. It is from this fact that electroscopes, or the collecting apparatus connected with them, must not be overtopped by the neighbouring trees or buildings, the negative electricity of which materially affects the indications given, and it is due to the same fact that no A. E. is discovered in the middle of a wood, or in a room, however high the ceiling. Under a clear sky, the tension of the A. E. is found to increase as we ascend, the lower aerial strata being less electrical than the higher. Becquerel proved this by a simple experiment on the plateau of Mount St Bernard. On a piece of oiled silk he placed a silk thread, covered with tinsel, one end of which, terminated by a ring, was connected with the rod of a straw electroscope, and the other end was tied to an arrow armed with a metal point. When the arrow was shot horizontally, the straws shewed no divergence; but when the arrow was shot upwards, they opened as it ascended, and diverged most when the arrow, in ascending, disengaged the ring from the rod of the electroscope. The same fact is shewn in the following way: When a very delicate electroscope is adjusted for any particular position, it will, when elevated a few feet above that position, give indication of positive electricity, and when placed a few feet below, it will be charged negatively. In clear weather, likewise, the A. E. is found to be subject to certain daily periodical variations, and appears to have two maxima and two minima in the course of twenty-four hours. The first maximum takes place a short time after sunrise, and the second shortly after sunset; the first minimum shortly before sunrise, and the second in the afternoon, when the heat of the day is greatest. The cause of these periodical changes is attributed to the formation and condensation of watery vapour in the atmosphere; shortly after sunrise, a vast quantity of vapour rises into the lower stratum of the air, and acting as a conductor, transmits the electricity of the higher strata towards the surface of the earth, giving rise to the first maximum. As the heat of the day increases, the air becomes less and less moist, and loses, in consequence, its conducting power, so that when the atmosphere is hottest and driest, the afternoon minimum takes place. After sunset, a rapid condensation occurs, and the lower strata are once more charged with moisture, which causes a second maximum at the beginning of night. Before sunrise,

the deposition of dew becomes greatest, so that the positive electricity of the lower strata is transmitted to the soil, causing a minimum at that time. It seems to hold generally that anything which tends to increase the conducting power of the lower strata, such as watery vapour in a visible form, increases at the same time the A. E., and hence it is that in time of mist the electrical tension is higher than in clear weather. It may also be attributed to the same fact that the A. E. is greatest in January, and least in June, the former month being cold and misty, and the latter warm and clear. In cloudy weather, the electroscope is affected sometimes positively, sometimes negatively, and is generally less influenced than in clear weather. The electricity of rain, snow, hail, &c., is sometimes positive, sometimes negative. In Stuttgart, for instance, it was found in the course of a year that the rain was 71 times positive to 69 times negative, and the snow 24 times positive to 6 times negative.

The cause of A. E. has given rise to much discussion among meteorologists, and as yet no theory has been proposed which satisfactorily accounts for it. According to Pouillet's theory, the electricity developed in evaporation and vegetation is a sufficient cause for the positive electricity of the air; the vapours and gases evolved in these processes being charged positively, the soil and plants, on the other hand, negatively. This opinion is combated by more recent observers, such as Riess and Reich, who, after a series of careful experiments, give it as their opinion that if such be the cause of A. E., the fact is wholly without experimental data. Lamont maintains that the air itself is not electrical, and is not capable either of conducting or of retaining electricity, and that the phenomenon of A. E. is due to the induction arising from the negative electricity of the earth, which he considers to be permanent. This theory can account for all the phenomena referred to in this article; but the statement that atmospheric air is incapable of conducting or retaining electricity, stands in need of experimental confirmation. For the electricity of the thunder-cloud, see LIGHTNING.

ATMOSPHERIC RAILWAY, a railway on which the locomotive-power is supplied by the pressure of the atmosphere more or less directly on the carriages themselves. The idea of producing railway locomotion in this manner has been successively prosecuted by Lewis, Medhurst, Vallance, and Pinkus; and latterly with a greater prospect of success by Clegg, in connection with Samuda. Vallance patented a plan which proposed the conveyance of passengers along a railway laid within an air-tight tunnel exhausted in front of a carriage working as a piston, the pressure of the atmosphere acting on the carriage from behind. This plan was made public in 1825, and ultimately brought into experimental operation at Brighton, proving the possibility of such a mode of transit. The general opinion as to its merits was, that though it might succeed in the transmission of goods, or, with a smaller tube than the tunnel, might suit well the conveyance of the mails, it could not be expected to enjoy the favour of the travelling public, on account of its dark close tunnel. Thus the subject of atmospheric railways had ceased to attract attention, when the curiosity of the public was again called to it, by the proposal of another plan of propulsion, by Henry Pinkus, an American gentleman, resident in England, who took out a patent for it about the year 1835, under the name of the Pneumatic Railway. The apparatus for this was to consist of a cast-iron tube of about forty inches diameter, having a slit of about two inches wide on its upper side, the slit (which was covered by a flexible flap or valve) furnishing an opening

through which the mechanism of a piston working within the tube might be connected with that of the leading carriage without.

Under improved arrangements of the details, Messrs Clegg and Samuda made an experiment of this plan in 1840, on a part of the line of the West London Railway; and so favourable was the issue, that the directors of the Dublin and Kingstown Railway adopted the atmospheric pressure system for a projected extension of their line from Kingstown to Dalkey. The nature of the ground through which this extension was to pass was so undulating, as to render the cutting of a line on it for being worked by locomotive engines very expensive. Accordingly, parliamentary sanction was obtained for the line, and the first A. R. was in full operation at the beginning of the year 1844. In that year the London and Croydon Railway Company began to lay down a line of A. R. alongside of their locomotive line from London to Croydon. The South Devon Railway Company also adopted the atmospheric mode of working on a part of their railway. Both of these lines, however, were shortly afterwards abandoned as unsatisfactory.

The result of these trials has clearly shewn that the A. R. system cannot stand in competition with that of the locomotive engine, unless, perhaps, in some very peculiar situation. The expense and care necessary to keep the tube with its valve in good working-order, led to the removal of the atmospheric mechanism from the various railways on which it was established; so that the history of Atmospheric Railways may be ranked under the chapter of failures.

ATOM (Gr. *atomos*, an indivisible particle; from *a*, not, and *temnō*, I cut). In ancient philosophy, two theories of the nature of matter were recognised, and these have continued to form subjects of argument among speculative men since the year 510 B.C. to the present time. The one theory is, that matter is infinitely divisible. Thus, a needle may be divided into two, and each of the parts may in its turn be broken or cut into two, and each of the latter again and again be subdivided, till the parts become so small that it may be impossible to see them by the naked eye; but these parts are regarded as capable of still further division, without limit or stoppage, provided more perfect or delicate means could be employed to act upon them. The second theory regarding the constitution of matter is, that in the repeated division and subdivision of a solid, liquid, or gas, a point will be at length reached when it will no longer be possible, by any conceivable means, to break a molecule in two, the molecule being a real unity, not composed of separable parts—in other words, an *atom*. The latter theory recognises the finite divisibility of matter, and considers that all matter is more or less compactly built up of myriads of atoms aggregated together, and having spaces or pores between the several atoms or particles. If it were possible to subject such matter to the scrutiny of a sufficiently powerful magnifying-glass, or microscope, and thus exhibit or behold the atoms so separated by spaces, then an appearance would be presented similar to that which the painter chooses to depict on the canvas when he is representing a snow-storm, and where every little flake of snow is separated from its neighbour one by a space in which there are none; or that which would be observed if, during a hailstorm, some great power were to cry, 'Halt!' and that instant every minute hailstone was arrested in the spot it had reached.

This view of the physical nature of matter is that which is known as the *atomic* or *corpuscular* theory, and has in modern times received some support

from the facts embodied in the chemical atomic theory originated by Dalton. Granting, however, that the chemist can prove that his simple and compound forms of matter are built up of chemical atoms, the problem still remains to be solved as to the possible identity of physical and chemical atoms. What the chemist regards as an A. in his science, may not be an ultimate and indivisible A. in a physical point of view; the chemical A., though incapable of division as a chemical A., may still be composed or built up of many physical atoms, and may be capable of being subdivided into such. Indeed, whilst the atomic theory of Dalton, when first announced, was eagerly seized upon as the best possible evidence for the existence of both chemical and physical atoms, the tendency of recent researches and discussions in chemistry has been to shew that the chemical A. is different from the physical, and does not necessitate the existence of the latter. See ATOMIC THEORY. According to the ordinary acceptance of the term, it is a molecule of matter having a definite weight, magnitude, and form, possibly alike for the atoms of the same material, but differing in those of different substances. The form of an A. is supposed by some men of science to be the same as that which the fragments of a substance assume when it is split in the direction of the planes of the cleavage of its crystals (see CRYSTALLOGRAPHY), but the general belief is, that all atoms are spherical, and that the various crystalline forms are produced by the manner in which the atoms are grouped together. In regard to the size of atoms, the researches of the famous microscopist, Ehrenberg, have demonstrated that an A. must be less than $\frac{1}{888,450,000,000}$ of a line in diameter; and the late Dr. Thomas Thomson, of the university of Glasgow, shewed that an A. of lead must occupy a space something less than $\frac{1}{888,450,000,000,000}$ part of a cubic inch.

ATOMIC HEAT. See HEAT.

ATOMIC THEORY. When one or more atoms of one kind of substance are brought into physical contact with one or more atoms of a different substance, the various atoms unite together by the force of chemical affinity (q. v.), and produce a chemical compound. The respective quantities of each of the combining substances are not the result of mere chance or casual freak of nature, but are regulated by certain laws. These laws were partially observed and discussed by earlier chemists and physicists, but it was reserved for Dalton (q. v.) to systematise the somewhat incoherent labours of his predecessors, and to announce, in positive language, the four laws which regulate the union of various kinds of substances, and which are still acknowledged by chemists as the LAWS OF COMBINING PROPORTION, or the Atomic Theory. These laws regulate the combination of unlike substances by *weight*, and not by *volume*; and they are based upon the preliminary acknowledged fact, capable of experimental demonstration, that the same compound substance is always composed of the same ingredients or elements.

The *first law* of combination by weight comprehended under the A. T. is the LAW OF CONSTANT PROPORTION, which teaches that the elements or ingredients which form a chemical compound are always united in it in the same proportion by weight. Thus, water, which consists of oxygen and hydrogen, does not contain one or both of these elements in indefinite amount, but it is invariably made up of 8 parts by weight of oxygen to 1 part by weight of hydrogen. It makes no matter whether the total amount of either element be represented by grains, ounces, pounds, or tons, it will always be found that the proportion of 8 parts of oxygen to 1 part of hydrogen is kept up.

Neither does the source of the water make any difference, for pure water obtained from rain, snow, or hail, the river or the sea, the sap of plants or the juices of animals, invariably contains the same elements in the same proportions. Again, common salt (chloride of sodium), whether it be obtained from sea-water, salt-springs, rock-salt, or even the blood of animals, always consists of chlorine and sodium in the exact and never varying proportion of $35\frac{1}{2}$ parts of chlorine to 23 parts of sodium. Whilst the law of constant proportion teaches us that the same compound is always built up of the same ingredients in the same proportion, it does not necessarily follow that the same elements or components in the same proportions will invariably form the same compound body. It is far otherwise; and many examples can be obtained, especially from organic chemistry, where the same components in the same proportions produce very different substances. Thus, starch and cotton (lignine)—very dissimilar substances—consist of carbon, hydrogen, and oxygen in the very same proportions; and gum-arabic and cane-sugar are similarly circumstanced. See ISOMERIC BODIES.

The *second law* is the LAW OF RECIPROCAL PROPORTION, which tells us that if two substances combine in certain proportions with a third, they combine in the very same proportion with each other. Thus, as has been already observed, 8 is the proportion in which oxygen will unite with 1 of hydrogen, and 6 is the proportion in which carbon unites with 1 of hydrogen; and the law now under consideration teaches us, that whilst oxygen combines with hydrogen as 8 to 1, and carbon with hydrogen as 6 to 1, we can, from these experimental results, deduce the conclusion that 8 will be the proportion of oxygen which will combine with 6 of carbon. Again, 8 parts of oxygen unite with 28 of iron, and 16 parts of sulphur combine with 28 of iron, and from these statements we can deduce, by the aid of the second law, that sulphur and oxygen will unite together in the proportions of 16 to 8. The figures which represent the proportions in which the elements constantly combine with each other, are called their equivalents or *atomic weights* (q. v.). The second law is one of great importance, and simplifies much the researches of the chemist, for it renders it unnecessary for him to determine in order the proportion in which a new substance will unite with every other of the sixty-one elementary substances; for having experimentally estimated the proportion in which the stranger element combines with one or two substances, he can predict that the very same proportion will regulate its chemical union with all the others.

The *third law* is the LAW OF MULTIPLE PROPORTION, which is, that when one substance combines with another in several proportions, the higher proportions are multiples of the first or lowest. Thus, hydrogen unites with oxygen in two proportions; as 1 of hydrogen to 8 of oxygen, when ordinary pure water is the result of union; and as 1 of hydrogen to 16 of oxygen, when peroxide of hydrogen, a powerful bleaching agent, is produced—the difference in the respective amounts of the oxygen—8 and 16—being, that the latter is a multiple of the former by 2. Again, carbon unites with oxygen in two proportions: as 6 of carbon to 8 of oxygen, when the inflammable gas, carbonic oxide, is formed; and as 6 of carbon to 16 of oxygen, when the non-inflammable gas, carbonic acid, is the result. The variation in this instance is, that the oxygen is present in the one case as 8, and in the other as a multiple of that number by 2, viz. 16. One of the best illustrations of this law occurs in the case of the union of nitrogen and oxygen: 14 parts of nitrogen can unite with

8 of oxygen, and then exist as laughing-gas; but the same amount of nitrogen can combine with 16, 24, 32, or 40 of oxygen—in the latter case, constituting nitric acid—all of the higher numbers being multiples of the first or lowest, viz. 8 by 2, 3, 4, and 5 times.

The *fourth law* is THE LAW OF COMPOUND PROPORTION, which teaches that the combining proportion of a compound substance is the sum of the combining proportions of its components. Thus, the compound body, carbonic acid, which consists of 6 of carbon united with 16 of oxygen, has the combining proportion 22, which is the sum of the combining proportions of the carbon and oxygen composing it, viz. $6 + 16 = 22$. Similarly, the compound substance, lime, contains 20 of the metal calcium combined with 8 of oxygen, and has the combining proportion of $20 + 8$, or 28. When carbonic acid and lime are linked together, as in marble, which is the carbonate of lime, then they are united in the proportion of 22 parts of carbonic acid and 28 of lime. Not only is 22 the proportion in which carbonic acid will combine with lime, but it is the proportion in which it will form compounds with every other substance of the same chemical constitution.

The preceding laws regulating the union of substances by weight were announced by Dalton as the results of experimental observation, and they are therefore entitled to have full confidence placed in them. Moreover, every succeeding observer in the same department of chemical science has brought forward researches which tend to strengthen the belief in the existence of such laws, and in the interpretation placed upon them. So long as we deal with quantities of material which can be weighed upon balances which may be so delicate in their movements as to turn and indicate with a thousandth of a grain weight, then each fresh experiment but serves to add fresh laurels to the profound wisdom and the clear head of the discoverer of these laws; but Dalton, in his zeal to fathom the subject to its greatest depths, carried these laws from their proper sphere, viz. the regulation of weighable quantities of material, to the support of a hypothesis which took cognizance of unweighable quantities or atoms. He believed that, if it were possible to get hold of a single atom of hydrogen, it would be represented by the weight 1; that a single atom of oxygen would be found to be 8; an atom of carbon, 6; &c. In short, that the figures which signified the proportions in which the various substances entered into union with each other, also indicated the proportional weights of single atoms of these substances. It is scarcely necessary to mention that the latter hypothesis is quite separable from the doctrine propounded in the four laws of combining proportion, and, whilst it assists in the conception of these laws, it is merely entitled to the position of a poetical fancy. The laws of the A. T., however, are not based upon this atomic hypothesis, and they demand our adherence solely on account of their being the enunciation of experimental facts, and are and may be believed in, totally irrespective of any opinion as to the existence or non-existence of atoms.

Recently, the subject of chemical atoms, and their construction, has been revived by the celebrated French chemist, Dumas. He considers it likely that chemical atoms are different from physical atoms, and supposes it probable that whilst a chemical atom of oxygen may be represented by the proportional number 8, and carbon by 6, &c., and that these are not divisible by chemical means, yet that such a chemical atom may be capable of division or separation by mechanical force, and then, ceasing to be a chemical atom, it may fall down into an indefinite number of physical atoms. In fact, Dumas inclines to the belief, which is now being shared by many

chemists, that all physical atoms are the same; that a chemical atom of any substance consists of a number of physical atoms enveloped as it were in a bag or otherwise held together; that the oxygen bag or aggregated chemical atom contains 8 times more physical atoms than the hydrogen atom, and thus its combining weight is 8 times greater; that the carbon bag is 6 times that of the hydrogen, &c.; at the same time, no opinion is expressed as to the number of physical atoms which may be in a chemical atom, for thousands of the former may be required to constitute one of the latter.

ATOMIC VOLUMES. The combination of simple and compound gases by volume occupied the attention of Dalton and Gay Lussac, and they announced a very simple relation which subsists between the A. V. of gases. Thus, taking equal atomic weights (q. v.) of various elements, we find that 1 equivalent or 8.0 grains of oxygen occupy, at 60° F. and a barometric pressure of 30 in., 23.3 cubic inches; 1 equivalent or 1.0 grain of hydrogen occupies, at 60° F. and 30 in. bar., 46.7 cubic inches; 1 equivalent or 35.5 grains of chlorine occupy, at 60° F. and 30 in. bar., 46.2 cubic inches; 1 equivalent or 127.0 grains of iodine vapour occupy, at 60° F. and 30 in. bar., 46.7 cubic inches. In other words, that equal atomic weights of hydrogen, chlorine, and iodine, occupy twice the bulk of the same amount of oxygen, and hence the atomic volume of the former is 2, as compared with oxygen, which is 1. The atomic volume of a body is the space occupied by a quantity of it proportional to its atomic weight, and is expressed by the quotient of the atomic weight divided by the specific gravity.

ATOMIC WEIGHTS, or CHEMICAL EQUI-VALENTS, are the proportions by weight in which the various elementary substances unite together. It is necessary that one element be selected as the starting-point of the series, and an arbitrary sum affixed to it, and thereafter all the other elements can have their sums awarded to them, according to the proportional amounts in which they combine with each other. The *second law*, mentioned under the ATOMIC THEORY (q. v.), explains the manner in which it can be demonstrated that a given amount of one element is equivalent to, and serves the same purpose in combining with a second element, as a greater or less amount of a third substance. In Britain and America, hydrogen is taken as 1, and all the other elements are represented by a quantity which is the minimum amount in which they might or do unite with 1 of hydrogen. On the continent, oxygen is regarded as the starting-point of the series, and is called 100, whilst the other elements have a proportional number attached. In the following table, the various elementary substances are arranged alphabetically, and in a line therewith, the symbol of each is given, and the atomic weight or equivalent on the hydrogen scale.

ELEMENTARY SUBSTANCES, WITH THEIR SYMBOLS, AND ATOMIC WEIGHTS OR EQUIVALENTS.

Element.	Symbol.	A. W. or Equiv. H = 1.
Aluminium, ...	Al	13.75
Antimony (Stibium), ...	Sb	120.30
Arsenic, ...	As	75.00
Barium, ...	Ba	68.64
Bismuth, ...	Bi	210.00
Boron, ...	B	11.00
Bromine, ...	Br	80.00
Cadmium, ...	Cd	56.00
Calcium, ...	Ca	20.00
Carbon, ...	C	12.00
Cerium, ...	Ce	46.00

ATOMIC WEIGHTS—ATONEMENT.

Element.	Symbol.	A. W. or Equiv. H = 1.
Chlorine, ...	Cl	35.49
Chromium, ...	Cr	26.27
Cobalt, ...	Co	29.49
Copper (Cuprum), ...	Cu	31.70
<i>Didymium</i> , ...	D	48.00
Erbium, ...	E	
Fluorine, ...	F	19.00
<i>Glucinum</i> , ...	G	4.70
Gold (Aurum), ...	Au	196.00
Hydrogen, ...	H	1.00
<i>Iinenium</i> , ...	I	
Iodine, ...	I	127.00
<i>Iridium</i> , ...	Ir	98.56
Iron (Ferrum), ...	Fe	28.00
<i>Lantanium</i> , ...	La	46.00
Lead (Plumbum), ...	Pb	103.57
<i>Lithium</i> , ...	Li	6.53
Magnesium, ...	Mg	12.00
Manganese, ...	Mn	27.57
Mercury (Hydrargyrum), ...	Hg	100.00
<i>Molybdenum</i> , ...	Mo	46.00
Nickel, ...	Ni	29.54
<i>Niobium</i> , ...	Nb	
Nitrogen, ...	N	14.00
<i>Osmium</i> , ...	Os	100.00
Oxygen, ...	O	16.00
<i>Palladium</i> , ...	Pd	53.00
Phosphorus, ...	P	31.00
Platinum, ...	Pt	99.00
Potassium (Kalium), ...	K	39.00
<i>Rhodium</i> , ...	Rh	52.00
<i>Ruthenium</i> , ...	Ru	52.00
<i>Selenium</i> , ...	Se	79.00
Silicon, ...	Si	28.00
Silver (Argentum), ...	Ag	108.00
Sodium (Natrium), ...	Na	23.00
Strontium, ...	St	43.84
Sulphur, ...	S	32.00
<i>Tantalum</i> or <i>Columbium</i> , ...	Ta	137.60
<i>Tellurium</i> , ...	Te	128.00
<i>Terbium</i> , ...	Tb	
<i>Thorium</i> , ...	Th	59.50
Tin (Stannum), ...	Sn	118.00
<i>Titanium</i> , ...	Ti	50.00
Tungsten (Wolfram), ...	W	92.00
Uranium, ...	U	60.00
<i>Vanadium</i> , ...	V	68.50
<i>Yttrium</i> , ...	Y	
Zinc, ...	Zn	32.52
<i>Zirconium</i> , ...	Zr	33.58

The less important, because rare, elements are printed in italics. Several of the above are not even numbers, and the researches of M. Stas have convinced him that there is no simple division of the atomic weights of elementary bodies.

The atomic weights were first investigated by Berzelius, and the numbers obtained by him are those at present in use, with certain important exceptions, the result of subsequent researches by Dumas, Pelouze, De Marignac, Stas and others. Thus the combining number of carbon was formerly 6, but Dumas and Stas have placed it at 12; sulphur was formerly 16, but its combining number is now established at 32, and oxygen, formerly 8, is now acknowledged to be 16.

The atomic weight of each element may be said to represent: 1st. The smallest proportion by weight in which it enters into or is expelled from a chemical compound, the smallest weight of hydrogen being taken as unity. 2d. The weight of the element in a solid state, which at any given temperature contains the same amount of heat as seven parts of lithium at the same temperature, that being one of the elements having the lowest combining number. 3d. The weight of the element, which in the form of gas or vapour oc-

cupies, under like conditions of temperature and pressure, the same volume as one part by weight of hydrogen. The atomic weight of a compound is the sum of the atomic weight of its elements.

In many instances the atoms of isolated elements are associated in pairs when in combination, and such an isolated atom or group of atoms constitutes an elementary molecule, and the molecular weight of an element is in a large number of cases twice its own atomic weight, while the molecular weight of a compound is with very few exceptions identical with its atomic weight.

ATONEMENT. Sin violates the ground of union which the personal creature has, by nature, with the holy God. The act of sin is one of separation; the act begets the state of sin, the state confirms and repeats the act. The doctrine of the A. treats of the mediation necessary for restoring the union between God and man, which has been lost by sin. The A., therefore, must ever be the fundamental doctrine in every religion of sinful creatures. In the Christian religion, it manifestly occupies this central position; for the Christian doctrine of the A. is but the explanation of its great historic fact—the embodiment in one person of the Divine and human natures in perfect agreement. In the person of Christ, God and man are atoned: He is their Atonement.

So fundamental is the doctrine of the atonement in the Christian religion, that it does not, like many other doctrines, form a ground of distinction among the different bodies into which the Christian world has been divided. All churches may be said to be equally orthodox on this point. The Church of Rome, the Greek Church, the various Protestant churches—established and dissenting—all agree, taking their standards as a criterion, in resting the sinner's hope of salvation on the mediatorial work or atonement of Jesus Christ. Nevertheless, there have been from the very beginning of speculative Christian theology, and still continue to be, within the bosom of the several churches, various ways of conceiving and explaining the exact nature and mode of operation of this mediatorial work. What follows is a brief sketch of the historical development of these speculations.

Christianity differs from heathenism in the clear perception which it has of the antagonism sin has introduced between God and man. Heathenism but vaguely conceives of this variance, and consequently has but an ill-defined notion of the atonement required, the notion seldom containing more than the idea of a reconciled union of the individual man with nature and the universal life. Even where its mythical divinities assume personality, it is but an ideal personality without any concrete reality of life, and consequently without any real significance for the conscience. In this state, the abject subjection of man to nature prevents his rising into that sphere of conscious freedom which makes sin sinful, and demands an A. with one who is Lord both of nature and man.

In Judaism, man stands above nature, in conscious relation to a personal God, whose written law exhibits the requirements of His relationship with man—requirements which are never met, and which only make him fearfully conscious of the ever-widening breach between him and his God. Thus the law awakened the sense of guilt, and the desire for an A.; a desire it could never satisfy. The never-ceasing demands of these ever-unfulfilled requirements were constantly acknowledged by its whole sacrificial *cultus*, which expressed the hidden ground of Jewish hope, and prophetically pointed to its future manifestation.

But whilst the Holy Scriptures, throughout the

Old Testament, exhibit the making of an A. by vicarious sacrifice (Lev. xvi. 21; xvii. 11); and the idea, both of the suffering and the deliverance of many by the sins and virtues of one, was common to all antiquity, the idea of the suffering and vicarious Messiah, plainly declared in the writings of the prophets (Luke xxiv. 46; Isaiah liii.; Psalms xxii.), and not entirely hidden from the more thoughtful and devout contemporaries of Jesus (Luke ii. 34; John i. 29), was one which was foreign to the Messianic faith of the great body of the people.

In the New Testament, Christ is everywhere exhibited as one sent from God for the salvation of the world (John iii. 16, 17); and as the condition, on the part of man, of his obtaining this salvation, we read of the requirement of repentance, faith, and reformation (Matt. iv. 17; v. 3, 11; vi. 12; Mark xvi. 16; Luke xv. 11), whilst, on the part of God, as conditioning and mediating His forgiveness of sins, we have exhibited the entire life of Christ upon earth conceived of as embracing severally its individual features (Acts v. 31; Rom. iv. 25; viii. 34); but more especially His death as a ransom for our sins (Matt. xx. 28; xxvi. 28), as a vicarious sacrifice (1 Peter i. 19; 2 Cor. v. 21), by which we are redeemed from the bondage of sin (1 Tim. ii. 6; Gal. iii. 13; 2 Peter ii. 1), and obtain forgiveness (Rom. v. 19; 1 Cor. xv. 3; 1 John i. 7), and eternal life and peace with God (John x. 11; Col. i. 20). Christ is therefore the Mediator between God and man (1 Tim. ii. 5), having made peace through the blood of His cross (Col. i. 21); the propitiation for our sins (1 John ii. 2; iv. 10); and our high-priest who offers himself a sacrifice to reconcile us with God (Heb. ii. 17; v. 1; ix. 28). Moreover, we are also taught that God has in Christ reconciled the world with Himself (Rom. v. 10; Col. i. 22; 2 Cor. v. 19).

In accordance with this full and explicit teaching of Holy Scripture, we find that the sufferings and death of Christ were ever regarded as of primary and essential importance in His work of redemption; but notwithstanding this, we look in vain throughout the early centuries of the Christian Church for anything like a systematic development of the doctrine of the Atonement. The germs of the doctrine existed, but without any logical connection or clearness. 'On this head there has been a twofold mistake—sometimes the existing beginnings of many later elaborated dogmas have been overlooked; or, on the other hand, it has been attempted to point out with literal distinctness church doctrines as if already developed.' The early church fathers dwell with a sort of inspired devotion upon those facts of the gospel which represent Christ as the sacrifice for our sins, as the ransom paid for our redemption, as our deliverer from the power of Satan, as the restorer to mankind of whatever was lost by the fall of Adam; but they seldom attempt to shew how these blessed results connect themselves with the sufferings and death of Christ; neither do they shew in what manner the A. has objectively been made, nor how it is brought to the experience of its individual subjects.

The narrow limits of this article will not allow us to specify the many ways in which the sufferings and death of Christ were regarded in relation to their A. for sin. During the first four centuries there appeared no certainty of opinion as to whether they were a ransom price paid to God or to the devil. The latter supposition is the more prevalent, and is shared in by Origen and St. Augustine. Gregory of Nyssa explains this opinion by saying, that the devil consented to receive Jesus as a ransom, because he regarded Him as more than an equivalent for all

those under his power; but that, notwithstanding his subtlety, he was outwitted, for, owing to the humiliation in which Christ was veiled, he did not fully recognise Him as the Son of God, and consequently was himself deceived. But having consented to receive Him as a ransom for mankind, he was righteously deprived of his dominion over man, whilst he could not retain Jesus when he discovered Him to be the Holy One of God, being horrified and tormented by His holiness.

Athanasius first of all successfully controverted this notion, and maintained that the ransom was paid to God. He argued that as God had threatened to punish transgressors with death, He could but execute His threat. But then it was not becoming the character of God to allow His purpose in the creation of man to be frustrated by an imposition practised upon him by the devil. The only expedient, therefore, which remained for his deliverance from death, was the incarnation and sacrifice of the Logos in his stead, by which the justice and veracity of God would be maintained, man delivered, the law fulfilled, and the power of the devil broken. It has often been stated that Tertullian uses the term satisfaction with respect to Christ's A. for sin, but this is incorrect, for although he employs the term, he never does so in the sense of a vicarious satisfaction, but only in the sense of making amends for our own sins by confession and repentance.

These elemental and mythical conceptions of the doctrine of the A. remained in a most imperfect and altogether undeveloped condition, until the acute and subtle genius of the Piedmontese Archbishop of Canterbury reduced them to order, and presented them in logical consistency. We must regard Anselm, therefore, as the author, at least as to its form, of the doctrine of vicarious satisfaction, which, under various modifications, has ever since continued to be held as the orthodox doctrine of the church. The following is, in all essential respects, his statement of the doctrine: The infinite guilt which man had contracted by the dishonour of his sin against the infinitely great God, could be atoned for by no mere creature; only the God-man Christ Jesus could render to God the infinite satisfaction required. God only can satisfy Himself. The human nature of Christ enables Him to incur, the infinity of His divine nature to pay, this debt. But it was incumbent upon Christ as a man to order His life according to the law of God; the obedience of His life, therefore, was not able to render satisfaction for our guilt. But although He was under obligation to live in obedience to the law, as the Holy One he was under no obligation to die. Seeing, then, that He nevertheless voluntarily surrendered His infinitely precious life to the honour of God, a recompense from God became His due, and His recompense consists in the forgiveness of the sins of His brethren.—In this form of the doctrine we are taught the necessity of an active vicarious satisfaction; but Anselm nowhere teaches the passive satisfaction, he nowhere says that Christ endured the punishment of men. Nor do we find in his writings the development of the subjective side of the doctrine—namely, how the satisfaction rendered to God mediates the A. in the experience of the believer.

Subsequent to the time of Anselm, and prior to the Reformation, there are two views of the A. which divide the opinions of this period: the one regarding the peculiar manner in which it was accomplished as absolutely necessary, and deriving its efficiency from its objective nature; the other supposing a subjective connection between the sufferings of Jesus and the price of redemption, because this was best fitted to effect the moral transformation of men. According to Anselm, the satisfaction rendered by

Christ was greater than the guilt for which He atoned; and it needed to be greater, for the payment of the debt due to God gave man no claim to the favour of God. Thomas Aquinas and his followers maintained Augustine's opinion of the infinite value of the blood of Christ rendering it more than sufficient; while the Scotists maintained that it was sufficient only because God was pleased to regard it as sufficient. But in the period between Anselm and the Reformation, little or no progress was made in the development of this doctrine.

We now come to the period of the Reformation, when the objective speculations of the schoolmen are brought under the subjective requirements of human souls, and the doctrine of the A. is viewed in this light. In the writings of Luther, one will only with difficulty arrive at his intellectual apprehension of this doctrine in its scientific form; but setting out with the consciousness of sin, one will everywhere discover how he realised that in Christ all sin is 'vanquished, killed, and buried, and righteousness remaineth a conqueror and reigneth for ever.' The following is an outline of the Lutheran doctrine, as laid down in the *Concordienformel*: It is alone by faith we can receive the blessings presented to us in the gospel by the Holy Ghost. Faith justifies, because it appropriates the merit of Christ. Therefore, the righteousness which is imputed to the believer, simply by the grace of God, is the obedience, the suffering, and the resurrection of Christ, by which He has satisfied the claims of the law, and atoned for our sins. For as Christ is not merely man, but God and man in one person, He was, as Lord of the law, no more subject to it than He was subject to suffering and death. For this reason, His twofold obedience—that which He rendered, on the one hand, by His suffering and death; and, on the other, by His righteous fulfilment of the law on our behalf—is imputed to us, and God acquits us of our sins, and regards us as just, in view of His complete obedience in what He did and suffered. This obedience embraces the entire existence of Christ upon earth, and is so complete that it fully covers the disobedience of men, so that it is not reckoned against them for condemnation. Christ is our righteousness, therefore, only in so far as in His entire person the most perfect obedience is exhibited, which He was able to render in that He was neither God alone, nor man alone, but both in one, God and man.

According to Calvin: if one asks how Christ has reconciled us with God, and purchased a righteousness which made Him favourable to us, it may be answered generally, that He accomplished this by the whole course of His obedience. But although the life of Christ is to be regarded as paying the price necessary for our deliverance, the Scriptures ascribe our redemption especially to His death. Calvin attached great importance to the particular mode of His death—any other mode of death would not have rendered the same satisfaction to God. He, however, says little or nothing about Christ's fulfilling the law for us, but dwells upon His delivering us from its curse. He does not, therefore, exhibit His active obedience separated, as an essential part of His satisfaction for sin, from His passive obedience. The importance attached to the obedience of His life arises from its natural and necessary connection with His suffering and death. And the great importance attached to His death is drawn rather from the view of its subjective necessity, than from the idea of the divine righteousness—namely, that without such a death there would have been no sufficient ground for the subjective realisation of deliverance from sin and guilt. Calvin's view differs from that of the Lutheran *Concordienformel* in that he does not regard the relationship of God to man merely from the stand-point of punitive and

satisfying righteousness, which always leads to the merely negative notion of a Redeemer from guilt and punishment, but looks upon Christ as the highest Mediator, through whom the nature of God is communicated to man. There was a necessity for Christ's incarnation, not merely because, apart from the suffering of the God-man, the divine righteousness could not be atoned, but also because, without such a divine Mediator, there could be no vital relation between God and man. 'Had man remained free from all taint, he was of too humble a condition to penetrate to God without a Mediator.'

While the reformers established the doctrine of the A. on the theory of Anselm, and extended it so as to make the sufferings of Christ include the Divine curse, and introduced distinctions between Christ's active and passive obedience, Socinus endeavoured to prove the falseness of Anselm's theory. He shares with the Protestants the subjective principle, which the period of the Reformation established, but developed it in a one-sided manner. Socinianism represents man as attaining to oneness with himself and with God by his own moral energy. It rejects that idea of the righteousness of God which makes it impossible for Him to forgive sin without a satisfaction, as imposing finite limitations upon the divine Being; and also objects to the doctrine of a satisfaction, on the ground that satisfaction for sin and forgiveness of sin are incompatible with each other; and, moreover, objects that sin and punishment are of so personal a nature as not to allow of their being transferred. It further opposes the doctrine of the active and passive obedience of Christ, on the ground, that the one excluded the other. Another objection maintained the actual impossibility of Christ's rendering the supposed satisfaction for sin.

The doctrine it sought to establish in the place of the one it attempted to overthrow may in brief be stated as follows. Man is reconciled to God by repentance and reformation. Only from an act of man changing his disposition, and not from an act of God changing His relation to man, follows his reconciliation with God. God is in Himself ever the same towards man—reconciled from all eternity; man alone has to assume a new relation; as soon as he does this, he is immediately reconciled; by this act of his will, he is at one with God. Only in man's moral state is there any obstacle to his reconciliation. This greatest and holiest accomplishment, the reconciliation of man with God, is achieved by an act of his will.

In this purely subjective theory, repentance occupies the place of faith in the orthodox doctrine, and faith becomes identical with obedience; for repentance and reformation are regarded as but the two sides of the same act of the will. It follows from this that justification is of works as well as reconciliation. A necessity for the sufferings of Christ is shewn for the following objects—that He might become our example; better fitted to render us help; that we might have a pledge and guarantee of the Divine forgiveness; and as conditioning His resurrection and ascension to glory.

We must now hasten to the form of this doctrine among 'Modern Calvinists,' without attempting further to exhibit the links in the chain of its historic connection. 'Modern Calvinism' represents the A. as that satisfaction for sin which was rendered to God, in his public character as moral governor of the world, by the perfect obedience unto death of our Lord Jesus Christ. The nature of this satisfaction was a moral, not a pecuniary satisfaction. It preserves to the moral government of God its authority, whilst its tendency is to secure the forgiveness of sin. The value of the sufferings of Christ consists in their tendency to uphold the Divine moral government.

unimpaired whilst pardon is extended to those who have violated it, rather than in their intrinsic excellence, which, though essential to, did not constitute their value. There was a moral necessity for Christ's sufferings and death—obstacles to the bestowment of pardon had to be removed—the influence of the Holy Spirit had to be secured. The whole contents of Christ's earthly existence, embracing both His active and passive obedience—a distinction which is unsupported by the word of God—must be regarded as contributing to the A. which He made. Of the actual sufferings of Christ immediately attending His death, it would be unpardonable to speak with confidence, so little has been revealed. It may, however, be considered—whether the Saviour's deprivation of His Father's countenance may not have been indirectly caused rather by His awful and afflicting sense of the evil of sin, than otherwise?—As to the 'Extent' of the A., there is a broad distinction to be made between the *sufficiency* of the A., and its *efficiency*. It may be true that Jehovah did not intend to exercise that influence of the Holy Spirit upon all which is necessary to secure the salvation of any one, but as the A. was to become the basis of moral government, it was necessary that it should be one of infinite worth, and so in itself adequate to the salvation of all. See, on this point of the 'Extent' of the A., the art. REDEMPTION, PARTICULAR and UNIVERSAL.

The foregoing represents the modified view of the doctrine as advocated by Dr. Payne, and as held, in all essential respects, by such men as Pye Smith and Wardlaw, which in its earlier form, and as found in the writings of Owen and Edwards, maintains that the A. was made only for the elect; and that its necessity with respect to them arose out of the eternal justice of God, which required that every individual should receive his due desert; and, consequently, that the sufferings of Christ were the endurance of punishment equivalent in amount of suffering, if not identical in nature—as Owen maintains—with that to which the elect were exposed: and, moreover, that the meritorious obedience of Christ in fulfilling the law, imputes a righteousness to those for whom the A. secures salvation, which gives them a claim to the reward of righteousness.

Our space will not allow us to present to the reader the various forms which this doctrine is made to assume in the philosophic theology of Germany from Kant to the present time. See NEANDER. We must, therefore, confine ourselves to the presentation of those views of the doctrine advocated by our own countrymen in our own time, which may fairly represent the present state of opinion with respect to this fundamental doctrine.

Let us begin with the view of modern Unitarianism, which may very clearly and fairly be presented in the words of one of its most able living advocates, the Rev. Professor John James Tayler: "There is *one* mediator between God and men, the man Christ Jesus." This can only refer to unrivalled pre-eminence, not to exclusive function. For all higher minds do, in fact, mediate between their less gifted fellow-creatures and the great realities of the invisible world. This "*one*" is a *human* mediator, "the man Christ Jesus"—not a being from another sphere an angel or a God—but a brother from the bosom of our own human family. "He gave himself a ransom for *all*" who embrace His offers and will hearken to His voice. He brings from God a general summons to repent; and with that He conveys, through faith, a spiritual power to shake off the bondage of sin, and put on the freedom of a new heart and a new life. He is a deliverer from the power of sin and the fear of death. This is the *end* of His mediation. This is the redemption

of which He paid the price. His death, cheerfully met in the inevitable sequence of faithful duty, was only one among many links in the chain of instrumentalities by which that deliverance was effected. It was a proof such as could be given in no other way, of trust in God and immortality, of fidelity to duty, and of love for mankind. In those who earnestly contemplated it, and saw all that it implied, it awoke a tender response of gratitude and confidence, which softened the obdurate heart, and opened it to serious impressions and the quickening influences of a religious spirit.'

Professor Jowett advocates an opinion peculiarly his own, if, indeed, language so confessedly vague and indefinite can be said to embody an *opinion*. It is this: 'that the only sacrifice, A., or satisfaction with which the Christian has to do, is a moral and spiritual one; not the pouring out of blood upon the earth, but the living sacrifice "to do thy will, O God;" in which the believer has part as well as his Lord; about the meaning of which there can be no more question in our day than there was in the first ages.'—Heathen and Jewish sacrifices rather shew us what the sacrifice of Christ was not, than what it was. They are the dim, vague, rude, almost barbarous expression of that want in human nature which has received satisfaction in Him only. Men are afraid of something; they wish to give away something; they feel themselves bound by something; the fear is done away, the gift offered, the obligation fulfilled in Christ. Such fears and desires can no more occupy their souls; they are free to lead a better life; they are at the end of the old world, and at the beginning of a new one.'—The work of Christ is set forth in Scripture under many different figures, lest we should rest in one only. His death, for instance, is described as a Ransom. It is not that God needs some payment before He will set the captives free. Ransom is deliverance to the captive. 'Whosoever committeth sin is the servant of sin.' Christ delivers from sin. 'If the Son shall make you free, ye shall be free indeed.' To whom? for what was the ransom paid? are questions about which Scripture is silent, to which reason refuses to answer.

A remarkably original work has been issued within the last few years by the Rev. John M'Leod Campbell on the subject of the Atonement. His views are as follows: The work of the Son of God, who came to do and did the will of His Father, must, in view of the deliverance which He wrought, be regarded as twofold: first, as dealing with man on behalf of God, and second, as dealing with God on behalf of man.

In dealing with man on behalf of God, Christ revealed to us the Father in His relation to a sinful world, shewed us what our sins were to God, vindicated in the world the Father's name, and witnessed to the excellency of that will against which we were rebelling. In thus revealing the will of the Father towards sinful men, He necessarily became a man of sorrow and suffering, but these arose naturally out of what He was, and the relation in which He stood to those for whom He suffered; and to the holiness and love of His very nature must we refer their awful intensity and immeasurable amount. He suffered what He suffered just through seeing sin and sinners with God's eyes, and feeling in reference to them with God's heart. By what He suffered, He condemned sin, and revealed the wrath of God against it. His holiness and love taking the form of suffering, compose the very essence and adequacy of His sacrifice for sin.

Again, in dealing with God on behalf of man, the oneness of mind with the Father which towards man took the form of condemnation of sin, became in

His dealing with the Father in relation to us a perfect confession of our sins, which was a perfect Amen in humanity to the judgment of God on the sin of man. Such an Amen was due in the truth of all things, due on our behalf, though we could not render it, due from Him as in our nature and our true brother. He who was the truth, could not be in humanity and not utter it; and it was necessarily a first step in dealing with the Father on our behalf. This confession of our sins by Him who, as the Son of God and the son of man in one person, could perfectly realise the evil of man's alienation, was a peculiar development of the holy sorrow in which He bore the burden of our sins; and which, like His sufferings in confessing His Father before men, had a severity and intensity of its own. But apart from the sufferings present in that confession, this Amen from the depths of the Humanity of Christ to the divine condemnation of sin, is necessarily conditioned by the reception of the full apprehension and realisation of the wrath of God, as well as of the sin against which it comes forth into His soul and spirit, into the bosom of the divine humanity, and, so receiving it, He responds to it with a perfect response, and in that perfect response He absorbs it. For that response has all the elements of a perfect repentance in humanity, for all the sin of man—a perfect sorrow—a perfect contrition—all the elements of such a repentance, and that in absolute perfection; all—excepting the personal consciousness of sin—and by that perfect response or amen to the mind of God, in relation to sin, is the wrath of God rightly met, and that is awarded to divine justice which is its due, and could alone satisfy it.

This confession of the world's sin by the Head and Representative of humanity, was followed up by His intercession as a part of the full response of the mind of the Son to the mind of the Father—a part of that utterance in humanity which propitiated the divine mercy by the righteous way in which it laid hold of the hope for man which was in God. 'He bore the sins of many, and made intercession for the transgressors.'

The Rev. F. D. Maurice professes to hold a purely biblical theology, as opposed to the theologies of consciousness, which he repudiates. His doctrine of the A. is the answer which the Bible gives to the demands of a sin-smitten conscience. A sinner requires, and is content to be told on the authority of Scripture, that the Son of God has taken away sin. This message from God is the gospel for all men. The sinner wants to be assured that God has spoken, that He has declared Himself the Reconciler, and desires to be shown how and in whom He has accomplished that work on his behalf.

To this question—How and in whom the work of reconciliation has been accomplished?—Mr. Maurice replies, in effect and almost in words as follows: The will of God is set forth in the Bible to be a will which is good to all, and the ground of all that is right, true, just, and gracious; that it also sets forth the Son of God as being one in will, purpose, and substance with the Father, and that His whole life on earth was an exhibition of, and submission to His Father's will; that the Son of God was Lord of men, the Root and Head of humanity, and the source of all light and righteousness in man: that being thus one with God and one with man, He brought the will of God into our nature, fulfilled it in our nature perfectly, and carried it down into the lowest condition into which it had fallen through sin; that in the fulfilment of this will in our nature, as its head, He shared its sufferings, enduring that wrath, or punishment, which proceeded from Holy Love, thus realising, on the one hand, the sins of the world, and on the other, the consuming fury of the holiness

of the love of God—with an anguish which only a perfectly pure and holy Being, who is also a perfectly sympathising and gracious Being, can feel: that the man Christ Jesus was for this reason the object of His Father's continual complacency—a complacency fully drawn out by the death of the cross—which so perfectly brought out to view the uttermost power of self-sacrifice which lay hidden in the divine love, and consequently that He exhibited humanity, in its head, atoned for, reconciled. In this way, to Mr. Maurice, is Christ 'the Lamb of God, which taketh away the sin of the world.'

Finally, Dr. Trench, who may be regarded as fairly representing the prevalent views of the more devout and thoughtful men of the present day holding orthodox opinions, speaks as follows: 'The spirit of man cries out for something deeper than repentance, confession of sin, amendment of life; something which shall reach further back: which shall not be clogged with sinful infirmities, as his own repentance even at the very best must be. Men cry for some work to rest upon, which shall not be *their* work, but which shall be God's; perfect, complete. They feel that there must be something which God has wrought, not so much in them as *for* them; they yearn for this, for A., propitiation, ransom, and conscience purged from dead works by the blood of sprinkling; a rock to flee to which is higher than they, than their repentance, than their faith, than their obedience, even than their new life in the spirit. Now, this rock is Christ; and John the Baptist pointed to this rock, when, to those about him who longed after more than amendment of life, he exclaimed, in the memorable words: "Behold the Lamb of God which taketh away the sin of the world."'

Christ's sacrifice was vicarious—He died not merely for the good of, but in the room and in the stead of others, tasted death for them. He did this of His own free will. He saw that nothing else would overcome their sinful perversity and wilful obduracy, and that this would be effectual to do so.

Christ took upon Himself the penalties of a sinful world, and His self-sacrifice is only *not* righteous, because it is so much better than righteous, because it moves in that higher region where law is no more known, but only known no more because it is transfigured into love. Vicarious suffering is the law and condition of all highest nobleness in the world. It is this which God is continually demanding of His elect, they approving themselves His elect as they freely own themselves the debtors of love to the last penny of the requirements which it makes.

But the sufferings and death of Christ were not merely vicarious, they were also satisfactory; and thus atoning or setting *at one*, bringing together the Holy and the unholy, who could not have been reconciled in any other way. It is not maintained that God could have pleasure in the sufferings of the innocent and the holy, and that innocent and holy His own Son; but only that He must have the highest pleasure in the love, the patience, the obedience which those sufferings gave Him the opportunity of displaying, which but for those He never could have displayed, Christ's sublime devotion to the will of God permitted the Father to say, 'I have found a ransom.' Christ satisfied herein, not the divine anger, but the divine craving and yearning after a perfect holiness, righteousness, and obedience in man; which craving no man had satisfied, but all had disappointed before.

The reader is referred for further and fuller information on this subject to the following works, which have been consulted and used in the preparation of this article: Baur's *Christliche Lehre von der Versöhnung*; Hase's *Hutterus Redivivus*; Neander's

Christliche Dogmengeschichte; Gieseler's *Lehrbuch der Dogmengeschichte*; Hagenbach's *Lehrbuch der Dogmengeschichte*, vierte Auflage; Calvin's *Institutes of the Christian Religion*; Edwards, *Concerning the Necessity and Reasonableness of the Christian Doctrine of Satisfaction for Sin*; Owen's *Death of Death in the Death of Christ*, and *Of the Death of Christ*; Payne's *Lectures on Divine Sovereignty*; Chalmers's *Institutes of Theology*; Wardlaw's *Systematic Theology*; Campbell's (John McLeod) *Nature of the Atonement*, &c.; Tayler's (J. J.) *Christian Aspects of Faith and Duty* (Discourse on 'Christ the Mediator'); Maurice's *Theological Essays*; Jowett's *St. Paul's Epistles*, first and second editions (Article 'On Atonement and Satisfaction'); Trench's *Five Sermons* (sermon on 'Christ the Lamb of God').

ATRA'TO, a river of New Granada, more important from its position than from its magnitude. It has already been mentioned under the head of AMERICA in connection with the scheme of opening a communication by water between the Atlantic and the Pacific.

The main stream falls into the Gulf of Darien by 9 mouths—the quantity of water, from the almost daily rains, being large in proportion to the area drained, which does not, at the utmost, exceed 300 miles by 75. Of the 9 mouths, the third in rank, the Boca Coquito, appears to offer the most available facilities for improving the navigation. About 220 miles above this entrance, opposite to Quibdo, the A. is 850 feet wide and 8 feet deep at the shallowest parts, while the entire fall to the sea averages less than 3 inches to a mile. Unfortunately, however, the A. itself cannot advantageously be followed thus far, because, as one advances to the south, the intervening ridge to the west, and its streams towards the Pacific become less and less practicable.

But a comparatively convenient route has been surveyed through the munificence of Mr. F. M. Kelley, a private citizen of New York. Ascending the Boca Coquito as before, this route leaves the main stream at a distance of 63 miles from the sea, following the Truando, one of its western affluents, for 36 miles more without impediment or interruption. From this point on the Truando to the Pacific there would still remain 32 miles; and it is only on this section that any serious difficulties would be found. The heaviest work would be a tunnel of 3½ miles in length. According to the plan, the canal would be without a lock; and its *termini* would require but little improvement to render them excellent harbours.

Thus would the A. realise the destiny which Humboldt chalked out for it upwards of 50 years ago.

ATRI'P. An anchor is said to be A. when it is just drawn out of the ground in a perpendicular direction. A top-sail is A. when it is just started from the cap.

A'TRIPLEX. See CHENOPODIACEÆ and ORACHE.

A'TRIUM, in Roman Architecture, was the covered court or entrance-hall which formed the chief part of a Roman house. It was lighted from the roof, which sloped towards an opening in the centre (the *compluvium*), through which the rain-water flowed into a kind of cistern situated on the floor (the *impluvium*). On both sides passages led to the several chambers. Its size was in proportion to the other parts of the house. After the burning of Rome in the reign of Nero, great attention was paid to the decorations of the entrance-halls or *Atria*. Here the female slaves were engaged in weaving and other domestic occupations, under the superintendence of their mistress. Family pictures were preserved in the A., it also contained the nuptial couch, and it

served as a general waiting-room for visitors and clients. The Atria of the temples were used as places of assembly of the senators, and for other public meetings.

A'TROPA. See BELLADONNA.

A'TROPHY (Gr. *atrophia*, want of nourishment; from *a*, not, and *trophé*, nourishment) is a morbid condition of animal or vegetable life, resulting in deficient nutrition of the body, or part of the body, and a consequent decay and waste of its substance. The term is not applied to the mere withholding the requisite supply of nutriment, but to the condition produced by various diseases that affect the body. See NUTRITION, also DIGESTION, DYSPEPSIA, HYPERTROPHY.

A'TRYPA, a genus of fossil brachiopod or lamp shells, having a close resemblance to the well-known *Terebratula*. It possessed a perforation for the passage of the peduncle, by which the animal attached itself to foreign bodies. This foramen is not visible in all examples of the same species, from the beak touching and overlying the umbo of the other valve; the animal was, therefore, probably free during a portion of its existence. The name (derived from *a*, without, and *trypa*, foramen) was given to this genus by Dalman, as he erroneously supposed that the perforation was entirely absent. Judging from the markings on the interior of the shell, the animal seems to have differed little from the recent *Rhynchonella*, except that it had large calcareous spines for the support of its labial appendages. A. is a strictly palæozoic brachiopod, the solitary Permian species being the last representative of the genus. Of the 179 described species, 100 are Silurian, 56 Devonian, 22 Carboniferous, and 1 Permian.

ATTACHÉ (French), a subordinate or assistant. The term is generally applied to young diplomatists who accompany embassies.

ATTACHMENT is an English legal term, signifying the form of process, by the authority of which the person or the goods of a debtor may be seized in satisfaction. As a proceeding against the person, it is a species of criminal process, and has the force of much that will be found under APPREHEND (q. v.); but in strictness, it means a process issuing from a court of record against a person guilty of a contempt, or, more properly, of a judicial contempt, and who is punishable in a summary manner by the court in whose presence, against whose authority, or against whose writs the contempt has been overtly displayed. Thus, in Hawkins's Pleas of the Crown, such contempts are thus classed: 1. Disobedience to the Queen's writs; 2. Contempts in the face of a court; 3. Contemptuous words or writings concerning a court; 4. Refusing to comply with the rules and awards of a court; and 5. Forgery of writs, or any other deceit tending to impose on a court. Parties are also liable to the process of A. as for a contempt of court where, in an arbitration (see ARBITRATION) the award having been made a rule of court under the 9 and 10 Will. III. c. 15, the parties refuse to obey the same. In Chancery, there may be A. of the person for judicial default or other offence to the court, as, for example, where a defendant fails to put in his answer or proper plea to the plaintiff's bill of complaint. The only other process of A. against the person which it is necessary here to notice, is the non-attendance in court of a witness, who in such event is considered to have committed a contempt of court, and to be liable to be punished for such contempt by attachment. An action may also be brought against such defaulting witness at the suit of the aggrieved party, on account of any loss or damage occasioned by the non-attendance.

The proceeding by A. of goods resembles in some respects the Scotch diligence or process of arrestment. See ARRESTMENT. The best illustration we can give of it, in this sense, is that relating to the power of a judgment creditor to recover under his judgment. By the 17 and 18 Vict. c. 125, it is provided that the judgment creditor may apply to the court or a judge for a rule or order to have the debtor orally examined as to the debts owing to him by any third party, or *garnishee*, as he is called (see GARNISHEE), and also for an order that all such garnishee debts be attached to answer the judgment debt, the service of which order has the effect of binding or attaching the debts in the garnishee's hands.

ATTACHMENT, FOREIGN. See FOREIGN ATTACHMENT.

ATTACK, in military warfare, is an advance upon the enemy, with a view of driving him from his position. It may either be an attack in the open field or an attack upon a fortress.

In an attack in the open field, the general first ascertains the strength and position of the enemy, by means of a reconnaissance or of spies. He then seeks to discover at what point the enemy can make the least resistance; which is generally on one or other flank. He next arranges to concentrate his chief strength upon this particular point; and to mask his real intentions by feigned operations in other places. He then attacks with energy and force; his troops advancing without halt till near enough to use their weapons with the greatest effect. The more the attack has the character of a 'surprise,' the greater the probability of its success. In order to make this success as much felt as possible, and to be provided also against unforeseen disaster, the attacking body should be followed at a distance by a reserve; a neglect of this precaution has frequently caused the entire failure of an attack. Various forms have been devised for the attack; but generally the *parallel* or *frontal* is the one made use of. Frederick the Great, however, won most of his battles by the oblique attack, in which one wing is more advanced than the other. The first Napoleon preferred, by means of his heavy columns, to penetrate, and break up the enemy's centre. Another mode combines an attack on one flank as well as in front, by two separate corps; so as either to get into the enemy's rear, or to perplex him as to his retreat. A skilful general will be guided by circumstances in his selection among these several modes of operating. An attack by night might act most signally as a surprise; but as this requires a very exact knowledge of the ground, an attack at early dawn is generally preferred.

The different arms of the service render each its own kind of aid during an attack. First come the skirmishers, or perhaps whole battalions of light and active troops, whose rifles or long-range guns commence the firing. Then come the main body of infantry in heavy column; they halt within musket-shot, fire, and charge with the bayonet—the skirmishers meanwhile deploying round to the rear of the column, but holding themselves in readiness to harass the enemy's flanks. English troops especially excel in the attack by bayonet in line; but foreign armies, for the most part, rely more upon the momentum of a compact and heavy column in an attack. There are positions in which the cavalry attack, with its shock and the use of the sword, is more efficacious than that of the infantry. The troopers approach at a trot, break into a gallop at a distance of one or two hundred paces from the enemy, and endeavour by their weight and impetuosity to force the enemy's line. There are many forms of cavalry attack, according to the nature of the ground

and the position of the enemy. The artillery, working at a distance, often begin an attack long before the infantry and cavalry can come up, harassing and confusing the enemy. At 800 to 1200 yards' distance, the artillery pour out shot and shell, and try to silence the enemy's guns, so as to make way for the attack of the infantry; while the bayonet-charge is being made, the artillery keep in check the enemy's cavalry. If the attack succeeds, the infantry and artillery take up the ground recently occupied by the enemy, leaving the cavalry and riflemen to maintain a pursuit; but if it fail, the artillery and cavalry take up such positions as will cover the retreat of the infantry.

In an attack upon a fortress, the operation is a part of that of besieging (see SIEGE); but very often intrenchments are attacked in the open field. Such an attack has the character of a surprise, when the works are approached under cover of night, and an attempt is made to break into them on all sides. In such case, there is a reserve corps, which is rapidly brought up when wanted; but the attacking corps retire behind the reserve, if repulsed. The artillery post themselves on the prolongation of the line of works, and try to dislodge the enemy's guns and gunners; or pour a concentric fire sufficient to breach the works. The infantry advance as close as will enable them to fire upon the gunners. When the enemy's fire is silenced, the engineers (under cover of the artillery) proceed to remove palisades and all other obstacles, and to bridge over ditches and openings. Then follow the operations of the storming-party, analogous to those noticed under ASSAULT.

ATTAINDER is the legal consequence of judgment of death or outlawry, in respect of treason or felony. It is said to have been derived from the Latin word *attinctus*, attainit, stained, and it is followed by *forfeiture of estate*, real and personal, and by *corruption of blood*; and generally it imports the extinction of civil rights and capacities. Thus, an attainted person cannot sue in a court of justice; he loses all power over his property; and he is by his A. rendered incapable of performing any of the duties, or enjoying any of the privileges of a free citizen. But absolute and severe as the consequences of A. seem to be, they have their limits. In regard to the attainted person, neither the government nor the crown can exercise absolute or capricious authority; everything must be done according to legal and constitutional principle and rule, and for the ends of public justice alone. Formerly, an attainted person could not give evidence in a court of justice; but that disability in England has been removed by the 6 and 7 Vict. c. 85, and in Scotland by the 15 and 16 Vict. c. 27.

We have stated that the immediate consequences of A., are *forfeiture of estate* and *corruption of blood*. The forfeiture is of estate real and personal; the latter, indeed, may be forfeited by mere conviction alone, and without A., no sentence or judgment being necessary to infer it. But A. is essential to the forfeiture of real estate, as to which the most serious A. occurs in treason, where the attainted man forfeits to the crown all his lands and freehold inheritance, whether fee-simple or fee-tail, and all his rights of entry on lands and tenements of freehold tenure, to be for ever vested in the crown; and also the profits of all lands and tenements of freehold tenure which he had in his own right. This forfeiture relates backward to the time of the treason committed; and yet it does not take effect unless there be A. complete; and therefore, if a traitor dies before judgment, or is killed in open rebellion, or is capitally punished by martial law, the A. operates no forfeiture of lands, for he never was attainted of

treason. But to this there is a curious exception mentioned by Blackstone—viz., that where the chief-justice of the Court of Queen's Bench in person, as the supreme coroner of all England, upon the view of the body of one killed in open rebellion, records the fact, and returns the record into his own court, both lands and goods shall be forfeited.

A. for *felony* involves the forfeiture of all chattel interest absolutely, and the profits of all freehold estates during life; and by A. for *murder*, the freehold lands of the offender held in fee-simple are also forfeited to the crown for a year and day, with power to the crown of committing upon them what waste it pleases. See WASTE. This doctrine of *year and day*, and *waste*, applied, until recently, to any felony whatever, with the exception of treason. But now, by the 54 Geo. III. c. 145, no A. for felony—except in the cases of treason or murder, or of abetting, procuring, or counselling the same—shall extend to the disinheritation of any heir, nor to the prejudice of any person other than the right or title of the offender himself during his own life.

The other consequences of A.—viz., *corruption of blood*, is anxiously and learnedly treated of in old law-books, and in Blackstone's *Commentaries*; but the ancient law on the subject has been so much narrowed in its application by modern legislation as to have lost much of its importance; and, indeed, this doctrine of corruption of blood was in modern times always looked upon as a peculiar hardship, at least as regards the family of the offender; and now, by the statutes 54 Geo. III. c. 145, already referred to, 3 and 4 Will. IV. c. 106, and 13 and 14 Vict. c. 60, whatever savoured of inhumanity or harshness under the ancient system has been effectually removed; in fact, it may be stated that, excepting in the cases of treason and murder, the law of corruption of blood, so far as the family of the offender are concerned, has ceased to form part of the law. Besides A. by the operation of law as above stated, there have been frequent instances of attainders by express legislative enactment, as to which, see BILL OF ATTAINER.

The Scotch law of A., consequent on a conviction for treason, corresponds to the English doctrine; and although the word A. is not a Scotch technical term in regard to crimes other than treason, the forfeitures consequent on conviction and judgment are very much the same as the English.

ATTAINER, BILL OF. See BILL OF ATTAINER.

ATTAIN'T, WRIT OF, was anciently a mode of inquiring whether a jury had given a false verdict, which has been abolished by the 4 Geo. IV. c. 50. A. is, however, still in use to some extent as a technical word in the law of England; thus, there is the plea of *autrefois A.*, or of a former attainer, for the same crime, and now regulated by the 7 and 8 Geo. IV. c. 28, s. 4.

In the old Scotch criminal law, A., or *attaynt*, signified a conviction, or being convicted.

ATTALEA, a genus of Palms, comprising a number of species, natives of the tropical parts of South America. They have in general lofty cylindrical smooth stems, but there are some stemless species. The leaves are large and pinnate. The fruit has a dry fibrous husk, enclosing a nut with three cells and three seeds. The leaves of some species are much used for thatching, and those of some are woven into hats, mats, &c. The nuts of *A. excelsa* and of *A. speciosa* are burned to dry the India-rubber obtained from the *Siphonia elastica*, which acquires its black colour from their smoke. The leaf-stalks of *A. funifera*, which is found in the southern maritime provinces of Brazil, and is there

called Piassaba, yield a fibre much used for cordage. The ropes made of it are very strong, and extremely durable in salt water. The Piassaba palm of the northern parts of Brazil, however, is totally different, and much of the Piassaba (q. v.) fibre imported into Britain is obtained from it. The fruit of *A. funifera*, known by the name of Coquilla nut, is as large as an ostrich's head, and supplies a kind of vegetable ivory, used for making umbrella handles, &c. The fruit of *A. compta*, the Pindóva or Indajá palm, is of the size of a goose's egg, and the kernels are eatable. It is a stately and beautiful tree, with a wide-spreading crown.

ATTAR. See OTTO.

ATTEMPT to commit a felony or criminal offence is in many instances equally cognizable by the criminal tribunals with the completed crime itself. See TREASON, FELONY, MISDEMEANOUR.

ATTERBURY, FRANCIS, Bishop of Rochester, was born on the 6th of March 1662, at Milton, near Newport Pagnel, in Buckinghamshire, and educated in Westminster School, from which, in 1680, he passed to Christ Church, Oxford. In 1687, he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, master of University College. Disappointed in his expectation of succeeding to his father's rectory, in 1693, he sought a wider field of distinction, for ambition seems to have stimulated his efforts rather more than the love of souls, and in London his rhetorical powers soon won him reputation. He became a royal chaplain, minister of Bridewell, and lecturer of St Bride's. In 1698, a temporary sensation was created in the learned world by the appearance of the Hon. Charles Boyle's *Examination of Dr. Bentley's Dissertations on the Epistles of Thales and the Fables of Æsop*. This clever, but shallow and malicious performance, was in reality composed chiefly by A., who had been the young nobleman's tutor at Christ Church. In 1700 he distinguished himself in a controversy with Dr. Wake and others regarding the powers and privileges of convocations. A.'s zealous and caustic defence of the ecclesiastical against the civil authority, procured him the thanks of the lower House of Convocation, and the degree of D.D. In 1704, he was promoted to the deanery of Carlisle, on which occasion he subjected himself to just obloquy by attempting to procure an alteration in the date of his predecessor's resignation, which happened to interpose a temporary obstacle to his appointment. In 1707 he was made a canon of Exeter; in 1709, preached at the Rolls Chapel; in 1710 he was chosen prolocutor to the lower House of Convocation, and in the same year he had the chief hand, according to the common belief, in drawing up the famous defence of Dr. Sacheverell; in 1712, he became Dean of Christ Church, where, however, his turbulent and combative spirit had meanwhile involved him in so many controversies, that there was no peace until he was removed; in 1713, he was made Bishop of Rochester and Dean of Westminster. It is supposed, not unreasonably, that A. aspired to the primacy; but the death of Queen Anne extinguished his hopes in that direction. His known character and Jacobite leanings made him no favourite with George I. In 1715 he refused to sign the bishop's declaration of fidelity, and some of the most violent protests of the Peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restoration of the Stuarts, brought down upon him at length the charge of treason, and, in August 1722, he was committed to

the Tower. A bill of pains and penalties was brought into the House of Commons, and passed in the Lords by a majority of 83 to 43. A., who had defended himself with great ability, was deprived of all his ecclesiastical offices, incapacitated from holding any civil or spiritual office in the king's dominions, and condemned to perpetual banishment. There is no doubt of the fact that A. was implicated in treasonable plots, but the legal proof on which this sentence was founded cannot be regarded as sufficient to justify its severity. In June 1723, he quitted England for France, and after a short stay at Brussels, finally settled in Paris, where he died, February 15, 1732. In his exile, he maintained a constant correspondence with his friends, and took an active part in the abortive conspiracies of the Jacobites. His fame as a writer is founded on his sermons, and his letters to Pope, Swift, &c.; as a letter-writer, indeed, he has seldom been surpassed.

ATTESTATION, in conveyancing, is the verification of the execution of deeds and wills by witnesses; hence the clause at the end of these instruments which immediately precedes the signatures of the witnesses, is called the A. clause. See DEEDS, WILLS, WITNESSES. In the Scotch practice, the corresponding clause is called the testing-clause. See TESTING-CLAUSE.

ATTIC, a term in architecture, employed to designate a low story rising above the cornice that terminates the main elevation of a building; in domestic architecture, it is usually applied to sky-lighted rooms in the roof.

ATTICA, one of the political divisions or states of Ancient Greece or Hellas, of which Athens was the capital. The territory is of triangular shape, having its north-east and south-west sides washed by the sea, while on the north it is connected with the mainland. In ancient times, it was bounded on the W. by Megaris and the Gulf of Saronica; on the S., which ran out into the 'marble steep' of Sunium, by the Ægean Sea; on the E. by the Ægean Sea; and on the N., by Boeotia, from which it is separated by a lofty range of hills, the most famous part of which was formerly called Cithæron. Ancient A. was thus walled in from the rest of Greece. The two principal rivers were the Cephissus and Ilissus; and if they exhibited the same features in ancient times as they do now, must have been mere mountain-torrents, dry in summer. The unfruitfulness of the soil, and the scarcity of water, compelled the inhabitants occasionally to send out colonies. According to ancient tradition, the Aborigines of A. were first civilised under Cecrops, who is said to have come hither from Sais, at the mouth of the Nile in Egypt, about 1550 B.C.; and to have introduced the culture of olives, and of several species of grain, as also to have implanted milder manners, and taught the worship of the gods. He is stated to have divided the country into 12 communities or states. This, however, was not the only division known in early A. A still older division into *phylai*, or tribes, existed, as also a minute subdivision into *demoi*, or townships. By Theseus, Athens was united with the eleven other states of A. under one government, of which Athens was made the seat. After this union of the several states, the whole of A. shared in the fortunes of Athens (q. v.), and, under Vespasian, became a Roman province. On the division of the Roman empire, A. naturally fell into the hands of the Greek emperors. In 396 A.D., it was captured by Alaric, king of the Goths. What may have been its population in ancient times, it is impossible to determine precisely. Clinton estimates it at upwards of half a million, but this is probably exaggerated.

At the present day (1868) Attica and Boeotia

form a department or government in the kingdom of Greece. The surface of the country is broken into hills and narrow plains. The most considerable hills are—Oxeia, 4636 feet; Elaté, 4629; Pentelicus, famous for its marble in ancient times, of a white brilliant appearance and perdurable character, 3884; and Hymettus, 3506. The largest plains extend in the neighbourhoods of Athens and Eleusis. As early as the time of Solon, A. was well cultivated, and produced wine and corn. Mount Hymettus was celebrated for its bees and honey, and metals were found in the range of the Laurium. Figs, olives, and grapes are still cultivated. Goats and sheep find suitable pasturage; but the country does not now produce much grain. The population of the department is 116,000. See Leake on the *Demoi* of A.

ATTICUS, TITUS POMONIUS, one of the most noble and generous men in ancient Rome, was born in 109 B.C., or a few years before the birth of Cicero. His excellent education, during which he enjoyed the companionship of Torquatus, the younger Marius, and Cicero, developed, at an early age, a love of knowledge, which was increased during his stay in Athens, where he remained many years, glad to be separated from the political distractions of his native land. After 65 B.C., when he was induced by Sulla to return to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in political affairs. Yet he was by no means without influence on public matters, as he lived on terms of familiar intercourse with several leading statesmen, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious mercantile speculations. His mode of life was frugal. When he was informed that a disorder under which he was labouring was mortal, he voluntarily starved himself, and died in 32 B.C. Among his personal friends, Cicero held the first place. The *Annales*, written by A., were highly commended by his contemporaries. They were especially valuable on account of containing genealogical histories of the old Roman families. A. was one of those men (not uncommon either in ancient or modern times) in whom fine culture and a fortunate social position had highly developed the faculty of good taste. He had no creative genius, but was possessed of such delicate discernment that he could detect the flaw that would have been invisible to Cicero. Every author was anxious to secure his favourable opinion. None of his writings have been preserved. His biography is found in Cornelius Nepos, and in Cicero's *Epistles to A.*

ATTILA (Ger. *Etzel*, Hungarian, *Ethel*), conjectured to have been originally titles of honour), king of the Huns, was the son of Mundzuk, a Hun of the royal blood, and in 434 A.D. succeeded his uncle Roas as chief of countless hordes scattered over the north of Asia and Europe. His brother Bleda, or Blödel, who shared with him the supreme authority over all the Huns, was put to death by A. in 444 or 445 A.D. The Huns regarded A. with superstitious reverence, and Christendom with superstitious dread, as the 'Scourge of God.' It was believed that he was armed with a supernatural sword, which belonged to the Scythian god of war, which must win dominion over the whole world. It is not known when the name 'Scourge of God' was first applied to A. He is said to have received it from a hermit in Gaul. The whole race of Huns was regarded in the same light. In an inscription at Aquileia, written a short time before the siege in 452, they are described as *imminentia peccatorum flagella* (the

threatening scourges of sinners). The Vandals, Ostrogoths, Gepidae, and many of the Franks, fought under his banner, and in a short time his dominion extended over the people of Germany and Scythia—i. e., from the frontiers of Gaul to those of China. In 447, after his unsuccessful campaign in Persia and Armenia, he advanced through Illyria, and devastated all the countries between the Black Sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The Emperor Theodosius collected an army to oppose the inundation of the barbarians, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedon, and Greece were overrun; seventy flourishing cities were desolated, and Theodosius was compelled to cede a portion of territory south of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451, A. turned his course to the west, to invade Gaul, but was here boldly confronted by Aëtius, leader of the Romans, and Theodoric, king of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne—called anciently the Catalaunian Plain—waited to meet the enemy. The army of the West, under Aëtius and Theodoric encountered the forces of the Huns near the site now occupied by the city of Chalons-sur-Marne. Both armies strove to obtain the hill of moderate height which rises near Mury, and commands the field of battle, and after a terrible contest, the ranks of the Romans and their allies, the Visigoths, were broken. A. now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command, and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the height into the plain was irresistible. On every side the Huns were routed, and A. with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the most sanguinary battle ever fought in Europe; for it is stated by contemporaries of A. that not less than 252,000 or 300,000 slain were left on the field. A., having retired within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pile, resolving to die in the flames rather than surrender; but by the advice of Aëtius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. In the following year, A. had recovered his strength, and made another incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, Apennines, and the lagoons of the Adriatic Sea, where they founded Venice. The Roman emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of Pope Leo I., who visited the dreaded barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans, and old chroniclers relate that the apostles Peter and Paul visited the camp of A., and changed his purpose. By 453, however, A. appears to have forgotten the visit of the two beatiſied apostles, for he made preparations for another invasion of Italy, but died of hæmorrhage on the night of his marriage with the beautiful Ildiko. His death spread consternation through the host of the Huns. His followers cut themselves with knives, shaved their heads, and prepared to celebrate the funeral rites of their king. It is said that his body was placed in three coffins—the first, of gold;

the second, of silver; and the third, of iron; that the caparison of his horses, with his arms and ornaments, were buried with him; and that all the captives who were employed to make his grave were put to death, so that none might betray the resting-place of the king of the Huns.

Jornandes describes A. as having the Mongolian characteristics—low stature, a large head, with small, brilliant deep-seated eyes, and broad shoulders. There can be little doubt that circumstances conspired in the case of A., to give a certain largeness to his barbaric conceptions, which made him a most formidable foe to the civilisation of Europe.

ATTOCK, a town and fort of the Punjab, on the left or east bank of the Indus, lat. 33° 54' N., long. 72° 20' E. Pop. 2000. A. stands within the limits of the fort, which is itself a parallelogram of 800 yards by 400. The place was established by the Emperor Akbar in 1581, to defend the passage of the river, being planted for this purpose on a steep and lofty part of the bank. In modern warfare, however, it is no longer a position of strength, being commanded by the neighbouring heights.

The situation of A. is important, whether in a commercial or in a military view. It is at the head of the steam-boat navigation of the Indus, being 940 miles from its mouth; while about 2 miles above it, the Cabul River, the only considerable affluent of the Indus from the west, is practicable for vessels of 40 or 50 tons to a distance of 50 miles. The valley, again, of this last-mentioned stream, presenting, as it does, the best approach to the east and south from Central Asia, has been the route of nearly all but the maritime invaders of India from the days of Alexander the Great downwards. *Turkistan*, where the Macedonians crossed the Indus, is supposed to have been the same as Attock.

ATTORNEY, in its general meaning, is one appointed by another to act for him in his absence, the authority for so acting being expressed by a deed called a Power of Attorney.

ATTORNEYS AND SOLICITORS are those legal practitioners who conduct litigation in courts of justice, preparing the cause for the barristers, or counsel, as they are called, whose duty and privilege it is to plead and argue on behalf of the contending parties, and who in open court have its exclusive audience. A. and S. also practise conveyancing, or the preparation of legal deeds and instruments, and they manage a great deal of other general business connected with the practice of the law, for which, as well as for the discharge of all their duties, they are highly remunerated by a fixed and liberal scale of charge. Theirs is, indeed, an extremely important, influential, and lucrative profession, and the well-employed attorney, and the 'family solicitor,' are expressions which readily suggest the idea of acute intelligence, along with comfort and affluent means.

They are called *A.* as practitioners in the courts of common law, because the attorney is one who is put in the place, stead, or *turn* of another. Formerly, when prosecuting or defending, suitors were obliged to appear *personally* in court; but now, on principles of convenience, A. may represent, and be made to prosecute or defend any action or suit in the absence of the parties. They are called *S.* in the Courts of Chancery, according theoretically to the more gentle (but not less absolute) compulsion of equity. S. also is the name usually given to this profession when they transact family or other general business out of court, and in their own chambers. A. and S. are admitted by the superior courts, of which, therefore, they are officers, having many privileges as such, and they are, in consequence,

peculiarly subject to the censure and control of the judges.

The statutes relating to this branch of the legal profession being numerous and complicated, were amended and consolidated by the 6 and 7 Vict. c. 73, by which it is enacted that no person shall act as an attorney or solicitor in any court of civil or criminal jurisdiction, or in any court of law or equity in England or Wales, unless he shall have been admitted, enrolled, and be otherwise duly qualified according to the provisions of the act. And it has been decided that the person who acts as an attorney without being properly qualified, is liable to be indicted for a misdemeanour. There is an exception, however, to the rule of admission as stated, contained in a subsequent act, the 7 and 8 Vict. c. 101, s. 68, which provides that clerks or other officers to any board of guardians under the poor laws, may commence or defend proceedings before magistrates, in special or petty sessions, or out of sessions, without being qualified as attorneys. And by the 20 and 21 Vict. c. 39, facilities are afforded for the admission and enrolment in England of A. and S. of those colonial courts where the English system prevails.

To entitle a person to admission as an attorney and solicitor under the above act, the 6 and 7 Vict. c. 73, it is required: 1st, That he shall have served—having been duly bound by contract in writing so to do—with some practising attorney or solicitor in England or Wales, a clerkship of five years; or—if he shall have taken a degree, under such circumstances as in the act mentioned, at Cambridge, Oxford, Dublin, Durham, or London—a clerkship of three years; and 2d, That in addition and subsequently to such service, he be examined by, or by direction of, one or more of the judges at Westminster, or (in the case of a solicitor) by the Master of the Rolls, touching his articles, service, fitness, and capacity to act; and the judges (or Master of the Rolls, as the case may be), upon being satisfied by such examination, or by the certificates of examiners appointed by them, of the competency of any candidate for admission, shall administer to him such oath as specified in the act, viz., ‘that he will truly and honestly demean himself in practice,’ and also the oath of allegiance; and after such oaths, shall cause him to be admitted as an attorney of the said courts of law at Westminster, or as solicitor of the High Court of Chancery, as the case may be, and his name to be enrolled as an attorney or solicitor of such courts. It is moreover enacted, that there shall be a registrar of A. and S., whose duty it shall be to keep an alphabetical list or roll of all A. and S., and to issue certificates as to persons who have been duly admitted and enrolled; and the duties of this office are by the act committed to the ‘Incorporated Law Society,’ until some person shall be appointed in their room. Such a certificate from the registrar, of due admission and enrolment, must be produced to the proper authorities, by any person desirous of practising as an attorney or solicitor, before he can obtain the stamped certificate required by the Stamp Act, 55 Geo. III. c. 184, authorising him to practise for the ensuing year; and in order to obtain such registrar’s certificate, a declaration in writing, signed by the attorney desirous of practising, or by his partner, or in some cases by his London agent, containing his name and address, the courts of which he is an admitted attorney or solicitor, and the date of his admission, must be delivered to the registrar. And if any attorney or solicitor shall practise in any of the courts aforesaid, without having obtained a stamped certificate for the current year, he shall be incapable of maintaining any action or suit to recover his fees or disbursements for business done under such circumstances.

The same statute also contains the following regulations, among others of less general information: That no attorney or solicitor shall have more than two clerks, bound by contract in writing, at one and the same time; nor any such clerk after he shall have left off business. That all persons admitted as A. of one of the superior courts of law at Westminster may, upon production of a certificate thereof, be admitted in any other court of law in England or Wales, upon signing the roll of the same; and that persons admitted as S. in the High Court of Chancery may in like manner obtain their admission in all other courts of equity, and in the Court of Bankruptcy. That no attorney or solicitor, who shall be a prisoner in any jail or prison, may commence or defend any action, suit, or proceeding in law, equity, or bankruptcy; or maintain any action for fees for business done during such his confinement; and that no practising attorney or solicitor shall be a justice of the peace in England or Wales, except in counties or towns corporate having justices by charter or otherwise. And that no attorney or solicitor shall commence an action or suit for his fees or charges in respect of any business whatever, until after the expiration of one calendar month after a bill of his costs and charges, signed by such attorney or solicitor, shall have been delivered to the party to be charged; and such party may, on a proper application, obtain an order for referring such bill to be taxed; and for staying all proceedings to recover the amount thereof in the meantime. An order may also be obtained directing an attorney or solicitor to deliver his bill (when he has not done so); and also an order for his delivering up, upon payment of what is due, all deeds, papers, and document, in his possession or power touching the business in such bill comprised. It is provided, however, that the act shall not extend to the examination, admission, rights, or privileges of any person appointed to be solicitor to the Treasury, Customs, Excise, Post-office, Stamp-duties, or any other branch of the revenue; or to be the solicitor of the city of London; or the assistant of the council for the affairs of the Admiralty or Navy; or the solicitor to the Board of Ordnance. (See *Stephen’s Commentaries*, vol. iii. p. 308, et seq.)

The position of A. and S. in Ireland, like the system of law and practice in that country generally, is so like that of the same profession in England, that it is unnecessary here to give any details respecting them.

The corresponding professional class in Scotland is a numerous one, and of various qualities and degrees. The chief and most privileged body among them are the *Writers to the Signet* (q. v.), who, with the Solicitors before the Supreme Courts, conduct all the business before these tribunals, although the latter have not the privileges of the former, nor are they so influential a body. They are both, however, on a footing of equality as practising A. or S., or law-agents, as they are called in Scotland, and they are both admitted by the Court of Session, and have the exclusive right of conducting legal business before that tribunal and the other superior courts; and they have facilities also for practising before all the inferior courts of the country. The provincial attorney class in Scotland are variously denominated as writers and solicitors, the former being the more general name among them. But in Aberdeen they have assumed the name of advocates—a name, however, by which they must not be confounded with the Faculty of Advocates at the Scotch bar. The Aberdeen advocate is neither more nor less than a country attorney. These provincial Scotch practitioners are not admitted in that country by the superior courts, but by the various sheriffs or county courts within whose jurisdiction they practise their profession.

ATTORNEY-GENERAL, the title by which, in England and Ireland, the first ministerial law officer of the crown is known. The A. is appointed by letters patent. His office corresponds in many respects to that of the Queen's Advocate in the Court of Admiralty and of the Lord Advocate in Scotland (q. v.), though the powers of the latter are more extensive and less clearly defined. Originally, the A. was simply the king's attorney, and stood to the sovereign in the same relation that any other attorney does to his employer. The term 'general' was afterwards conferred to distinguish him from attorneys appointed to represent the interests of the crown in particular courts, such as the Court of Wards; or from the master of the crown office, who is called the 'Coroner and Attorney for the Queen.' The early history of this office is involved in obscurity. Though there can be no doubt that the crown must always have been represented by an attorney in the courts of justice, there is no trace of the existence of such an officer as the A., in the modern sense, till some centuries after the Conquest. Up to a period comparatively recent, the king's serjeant was the chief executive officer of the crown in criminal proceedings, and this circumstance gave rise to various questions of difficulty as to the right to precedence of these officers respectively. These questions were set at rest in 1811, by a special warrant by the then Prince Regent, afterwards King George IV., by which it was declared that both the attorney and solicitor general should have place and audience before all other members of the English bar. A similar question arose in a Scotch appeal in the House of Lords in 1835, between the A. and Lord Advocate, which was also decided in favour of the former. The following may be enumerated as the principal duties of the A.: 1st, To exhibit informations and conduct prosecutions for crimes which have a tendency to disturb the peace of the state or endanger the constitution (see PLEAS OF THE CROWN); 2d, To advise the government on legal questions; 3d, To conduct prosecutions and suits relating to the revenue; 4th, To file informations in the Exchequer for personal wrongs committed on any of the possessions of the crown; 5th, To protect charitable endowments in the sovereign's name, as *parens patriæ*, and, generally, to appear in all legal proceedings in which the interests of the crown are at stake. The attorney and solicitor general are two of the Commissioners of Patents (q. v.) *ex officio*. The powers of the solicitor-general are co-ordinate with those of the A., and in the absence of the latter, or during a vacancy, the former may perform his functions in all their extent. Both must have seats in the House of Commons, and their tenure of office concurs with that of the government of which they are members. If not honourable by birth, they are always knighted.

The duchies of Lancaster and Cornwall, and the county palatine of Durham, have separate attorney-generals.

ATTRACTION is the general name for the force or forces by which all bodies, from the minutest particles to the largest planets, suns, and systems of suns, tend to approach, or are *drawn towards* (*ad*, to; *tractus*, drawn) one another, and when in contact, are held together. The term is generic, embracing a vast variety of facts, which are subdivided under five heads or species of A. These are—1. Gravitation; 2. Cohesion; 3. Adhesion; 4. Chemical Affinity; 5. The attractions of Electricity, Magnetism, &c. See GRAVITATION, COHESION, &c. Attempts have been made to deduce all these phenomena from one principle of A., modified by an opposing force of repulsion, but as yet without success. Still less can they be explained by assuming only *one* force—

A. alone, or repulsion alone—for this, too, has been attempted. The idea of an attractive force acting as the bond of the universe was first introduced as a scientific hypothesis by Newton, and was violently combated by Leibnitz and others.

ATTRIBUTE, in the Fine Arts, is a species of symbol, consisting of a secondary figure or object accompanying the principal figure—as the trident of Neptune, or the owl of Minerva. Attributes serve to mark the character meant, and add to the significance of the representation. The necessity of using them lies in the limited means of expression possessed by the formative arts. Attributes may be either essential or conventional. Essential attributes have some real relation or resemblance to the object or idea to be expressed; and are often such as could stand alone as symbols—as the bee, representing diligence. Attributes, in the strictest sense, and as distinguished from symbols, are such as are significant only in connection with a figure, to which they in a manner belong; e. g., the wings of genii, the finger on the mouth of Harpocrates. The last is an example of an accidental or conventional A., of which kind are also the *anchor*, to express hope; the *cross*, faith. Common attributes in Christian art—the harp for King David, and writing materials for the evangelists, especially St John.

ATTRIBUTE, in Logic, is used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus, wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere; in the same way, whiteness is called an A. of snow.

ATWOOD'S MACHINE, an instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity. It was invented by George Atwood or Attwood, a mathematician of some eminence, who was born in 1745, educated at Cambridge, became fellow and tutor of Trinity College in that university, published a few treatises on Mechanics and Engineering, and died in 1807. It is found that a body falling freely, passes through 16 feet in the first second, 64 feet in the first two seconds, 144 feet in the first three seconds, and so on. Now, as these spaces are so large, we should require a machine of impracticable size to illustrate the relations just mentioned. The object of A. M. is to reduce the scale on which gravity acts without in any way altering its essential features as an accelerating force. The machine consists essentially of a pulley, P (see fig. 1), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *q*, at its extremities. The pulley rests on a square wooden pillar, graduated on one side in feet and inches, which can be placed in a vertical position by the levelling-screws of the sole on which it stands. Two stages, A and B, slide along the pillar, and can be fixed at any part of it by means of fixing-screws. One of these stages, A, has a circular hole cut into it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken, and intercepts the passage of the weight. A series of smaller weights, partly bar-shaped, partly circular, may be placed on the cylinders in the way represented in figs. 2 and 3. A pendulum usually accompanies the machine, to beat seconds of time. The weight of the cylinders, *p* and *q*, being equal, they have no tendency to rise or fall, but are reduced, as it were, to masses without weight. When a bar is placed on *p*, the motion that ensues is due only to the action of

gravity upon it, so that the motion of the whole must be considerably slower than that of the bar falling freely. Suppose, for instance, that p and g are each $7\frac{1}{2}$ ounces in weight, and that the bar is 1 ounce,

Atwood's Machine.

the force acting on the system—leaving the friction and inertia of the pulley out of account—would be $\frac{1}{16}$ of gravity, or the whole would move only 1 foot in the first second, instead of 16. If the bar be left free to fall, its weight or moving force would bring its own mass through 16 feet the first second; but when placed on p , this force is exerted not only on the mass of the bar, but on that of p and g , which is 15 times greater, so that it falls altogether 16 times more matter in the second case to move than in the first, and must, in consequence, move it 16 times more slowly. By a proper adjustment of weights, the rate of motion may be made as small as we please, or we can reduce the accelerating force to any fraction of gravity. Suppose the weight to be so adjusted that under the moving force of the bar or circular weight the whole moves through 1 inch in the first second, we may institute the following simple experiments: *Experiment 1.*—Place the bar on p , and put the two in such a position that the lower surface of the bar shall be horizontally in the same plane as the 0 point of the scale, and fix the stage A at 1 inch. When allowed to descend, the bar will accompany the weight, p , during one second and for 1 inch, when it will be arrested by the stage A, after which p and g will continue to move from the momentum they have acquired in passing through the first inch. Their velocity will now be found to be quite uniform, being 2 inches per second, illustrating the principle that a falling body acquires, at the end of the first second, a velocity per second equal to twice the space it has fallen through. *Exp. 2.*—Take, instead of the bar, the circular weight, place the bottom of p in a line with the 0 point, and put the stage B at 64 inches. Since the weight accompanies p throughout its fall, we have in this experiment the same conditions as in the ordinary fall of a body. When let off, the bottom of the cylinder, p , reaches 1 inch in 1 second, 4 inches in 2 seconds, 9 inches in 3 seconds, 16 inches in 4 seconds, 25 inches in 5 seconds, 49 inches in 7 seconds, and 64 inches and the stage in 8 seconds—shewing that the spaces described are as the squares of the times. *Exp. 3.* If the bar be placed as in *Exp. 1*, and the stage A be fixed at 4 inches, the bar will accompany the weight, p , during two seconds, and the velocity acquired in that time by p and g will be 4 inches per second, or twice what it was before. In the same manner, if the stage A be placed at 9, 16, 25, &c. inches, the velocities acquired in falling through these spaces would be respectively 6, 8, 10, &c. inches—two inches of velocity being acquired in each second of the fall. From this it is manifest that the force under which bodies fall is a uniformly accelerating force—that is, adds equal

increments of velocity in equal times. By means of the bar and the stage A, we are thus enabled to remove the accelerating force from the falling body at any point of its fall, and then question it, as it were, as to the velocity it has acquired.

AUBE, the name of a river and a department of France. The river A., a tributary of the Seine, rises near Pralay, on the plateau of Langres; flows in a north-west course by Rouvres, La Ferté, Bar, and Arcis; and falls into the Seine at Pont-sur-Seine, after a course of 90 miles.—The department of A., which occupies the southern part of the old province of Champagne, and a small portion of Burgundy, is bounded on the N. by the Marne; on the E. by the Haute-Marne; on the S.W. by the Yonne; and on the N.W. by the Seine-et-Marne. The eastern part belongs to the basin of the A.; the western, to the basin of the Seine. Area, 2351 square miles. Pop. 262,785. The climate is mild, moist, and changeable; but on the whole healthy. A great portion of the area is arable land. The north-east is chiefly applied to pasturage; but the south-east is far more fertile, rich in meadow-land and forest, and producing grain, hemp, rape, hay, timber, and wine. In minerals, the department possesses little besides limestone, marl, and potters' clay. The chief manufactures are woollen cloth, cotton, and linen goods, ribbons and stockings, leather, parchment, &c. The sausages and bacon of A. have long been famous. Troyes is the capital of the department.

AUBENAS, a town in France, in the department of Ardèche. It is picturesquely situated on the right bank of the Ardèche, 14 miles south-west from Privas, in the middle of the volcanic region of Vivarais. It looks well from a distance; but the streets, with the exception of one traversed by the diligence, are narrow and crooked, the squares small, and the houses very irregularly built. An old and rapidly decaying wall, flanked with towers, girds the town, which contains an ancient castle. A. is the principal mart for the sale of chestnuts and silk in the department. Several important fairs are also held here. It possesses in addition manufactures of silk, paper, cotton, coarse cloths, leather, &c., the machinery of the mills being driven by water. Pop. 7410.

AUBER, DANIEL FRANÇOIS ESPIRIT, a composer of operas, was born at Caen in Normandy, January 29, 1784. His father was a printseller in Paris, and being desirous that his son should devote himself to business, he sent him to London to acquire a knowledge of the trade. But his irresistible passion for music obtained the upper-hand, and after a short stay, he returned to Paris. Among his earliest compositions may be noticed—the *concertos* for the violoncello, ascribed to Lamare the violoncellist; the concerto for the violin, played by Mazas with great applause at the Conservatory of Music, Paris; and the comic opera, *Julie*, with a modest accompaniment for two violins, two altos, and a bass. These works were very successful; but A., aspiring to greater things, now devoted himself to a deeper study of music under Cherubini, and wrote a mass for four voices. His next work, the opera *Le Séjour Militaire* (1813), was so coldly received that A. grew disheartened, and resolved to abandon the idea of reaching eminence as a musical composer. However, the death of his father compelled him to be dependent on his own resources; and in 1819 appeared *Le Testament et les Billets-doux*, which was also unsuccessful; but in *La Bergère Châtelaine* he laid the foundation of his subsequent fame. In all these early essays, as well as in the opera of *Emma* (1821), he displayed an original style; but afterwards he became an imitator of Rossini,

and disfigured his melodies with false decorations and strivings for effect. All his later works, excepting *La Muette de Portici* (Masaniello), produced in 1828, are written with an assumed mannerism, but in a light and flowing style, with many piquant melodies which have made the tour of Europe. The operas *Leicester* (1822), *La Neige* (1823), *Le Concert à la Cour*, and *Léocadie* (1824), *Le Maçon* (1825), *Fiorella* (1826), *La Fiancée* (1829), *Fra Diavolo* (1830), were followed by a series of lighter works: *L'Elixir d'Amour*, *Le Dieu et la Bajadere*, *Les Faux Monnayeurs*, &c.; the later operas, *Gustave ou le Bal Masqué*, *Le Lac des Fées*, *Le Cheval de Bronze*, *Les Diamants de la Couronne*, *La Part du Diable*, *La Sirène*, and *Haydée*, exhibiting the same popular qualities as their predecessors; but their interest is evanescent, as they are deficient in depth of thought and feeling. His later works are *Jenny Bell* (1855), and *Manon Lescaut* (1856). After the death of Cherubini (1842), A. was appointed director of the Conservatory of Music, Paris.

AUBIGNÉ, MERLE D'. See MERLE D'AUBIGNÉ.

AUBIGNÉ, THEODORE AGRIPPA D', a famous French scholar, was born on 8th February 1550, near Pons in Saintonge. At an early period, he exhibited a remarkable talent for the acquisition of languages. Although come of a noble family, he inherited no wealth from his father, and consequently chose the military profession. In 1567, he distinguished himself by his services to the Protestant cause, and was subsequently rewarded by Henry IV., who made him vice-admiral of Guienne and Bretagne. His severe and inflexible character frequently embroiled him with the court; and after the death of Henry, he betook himself to Geneva, where he spent the remainder of his life in literary studies. He died April 29, 1630.

His best known work is his *Histoire Universelle*, 1559—1601 (Amsterdam, 1616—1620), which had the honour of being burned in France by the common hangman, as also his *Histoire Secrète, écrite par lui-même* (1721). A. was possessed of a spirit of biting satire, as is proved by his *Confession Catholique du Sieur de Sancy*, and his *Aventures du Baron de Feneste*.

AUBRY DE MONTDIDIER, a French knight who lived in the times of Charles V., and, as tradition says, was assassinated in the forest of Bondy by Richard de Macaire in 1371. The latter became suspected of the crime on account of the dog belonging to the deceased Aubry invariably displaying towards him the most unappeasable enmity. Macaire was therefore required by the king to fight with the animal in a judicial combat, which was fatal to the murderer. This tale was afterwards, under the titles of *Aubry's Dog*, *The Wood of Bondy*, *The Dog of Montargis*, frequently acted, the 'dog' always gaining the greatest share of applause! After being performed with success at Vienna and Berlin, it was appointed to be played at the Weimar Theatre, of which Goethe was the manager; but the poet resigned his office before the dog made his *début*.

AUBURN, a beautiful city, capital of Cayuga co., New York, on the railroad between Albany and Buffalo, 174 miles W. of A. and 152 miles E. of B. It is 2½ miles N. by W. of Owasco Lake, the outlet of which flows through the town. Lat. 42° 53' N.; lon. 76° 40' W. Auburn is the seat of a theological seminary, founded in 1821, under the direction of the Presbyterians. The city contains 12 churches, viz., 3 Presbyterian, 1 Episcopal, 3 Methodist, 1 Baptist, 1 Universalist, 1 Second Advent, and 2 Roman Catholic, the Auburn Academy, 6 banks, and 6 or 7 newspaper offices. The Auburn State Prison is a large and costly stone structure, and the number of convicts sometimes amounts to more than 800. The Auburn

Academy has from 75 to 100 students. There are 5 public free-schools, all in a flourishing condition. Pop. in 1860, 10,986.

AUBUSSON, PIERRE D', grand master of the order of St. John of Jerusalem, was born in 1423 of an ancient and noble French family. His early history is imperfectly known, but he is said to have borne arms, when very young, against the Turks in the wars in Hungary, and to have distinguished himself by the mingled zeal and valour he displayed. Here he acquired that intense antipathy to the 'Infidels' which subsequently animated his whole public career, and gave a peculiar bias to his ambition. Having returned to France, he accompanied the dauphin in his expedition against the Swiss, and was instrumental in securing their defeat at the battle of St. Jacob near Basle. His mind, however, constantly reverted to the ominous encroachments in the East of the dreaded Mussulman, and at last he resolved to betake himself to Rhodes, where he enrolled himself among the brotherhood of Christian knights. Now, his history emerges into clear light, and assumes a very considerable importance. He swept the Levant, and chastised the pirates who prowled perpetually among the Greek isles, obtaining the approbation and regard of the grand master. In 1458, by his ardour and address he succeeded in forming a kind of Christian league between the French monarch and Ladislaus, king of Hungary, against Mohammed II. This was the great aim of A.'s life, the 'idea' which continually possessed him—viz., the necessity of a vast organization of all Christendom to overthrow the power of the Turks. Step by step, through long years, he won his way to supreme power in his order. In 1476, he was elected Grand Master. It was a critical period for the civilisation and religion of Europe. Constantinople had recently been taken and the Byzantine empire destroyed by Mohammed II. Every day the conqueror marched further west. Thrace, Macedonia, Central Greece, Servia, Wallachia, Bosnia, Negropont, Lesbos, and the islands of the Adriatic, had been successively conquered by him. Proud of his rapid glories, and sustained by an immense prestige, the sultan threatened to dictate terms from Rome to the entire West. Rhodes, however, stood in his way, the sentinel isle of Christianity, on the great maritime route between Asia and Europe. Mohammed saw that the battle between the two faiths must begin here; and in May 1480, a Turkish army of 100,000 men, commanded by a Greek renegade, Palæologos, landed in the island, and commenced to besiege the town. Two desperate assaults were made. The Turks, however, were compelled to desist, and sailed away, leaving 9000 dead. Mohammed was enraged, and planned a second expedition, which was interrupted by his death at Nicomedeia in Asia Minor, May 1481. After this, A. took a leading part in the religious diplomacy of the papal court, and received from the pontiff many honours and privileges. Meanwhile, he exerted himself to improve and strengthen the internal organisation of the brotherhood, enriching the diplomatic code of his order with several wise statutes and regulations relative to the election of dignitaries, the finances, &c., and exciting great admiration throughout Christendom. In 1501, he was appointed generalissimo of the forces of the German emperor, the French king, and the pope, against the Turks; and in spite of his great age, he enthusiastically entered on his duties, and sailed to attack Mitylene; but the expedition failed on account of the discordant aims which the various belligerents had in view. Broken by disappointment and vexation, the grand master returned, and died at Rhodes in July 1503, at the age of 80.

AUCH, the capital of the department of Gers, in the south of France, situated on the river Gers, 42 miles west of Toulouse, lat, 43° 38' N., long. 0° 35' E. Pop. 7942. It is the seat of an archbishop, and possesses a museum of natural science, together with an old and beautiful cathedral, the painted windows of which are greatly admired. Its chief articles of trade are woollen and cotton stuffs, fruits, wine, and brandy.

In ancient times, it was called *Elimberis*; and at a somewhat later period took its name from the Auscii, whose chief town it was. In the 8th c., it became the capital of Gascony, and later, of the county of Armagnac.

AUCHE'NIA (from the Gr. *auchen*, the neck), a genus of ruminating quadrupeds, of which the Llama (q. v.) and the Alpaca (q. v.) are the best known. The genus is exclusively South American; indeed, the species occur only on the lofty ranges of the Andes. They are nearly allied to the camels, and may be regarded as their representatives in the zoology of America. They form, along with them, the family *Camelidae* (see *CAMEL*), and were included by Linnæus in the genus *Camelus*. They agree with the camels in certain important anatomical characters, particularly in the structure of the stomach; and also resemble them very much in general form, in the long neck, small head, prolonged and movable upper lip, and small apertures of the nostrils. They differ from them partly in dentition, and partly in the more cloven feet and movable toes. The nails, also, are stronger and curved, and each toe is supported behind by a pad or cushion of its own; by all which the feet are admirably adapted for the rocky heights which the animals inhabit. Considerable doubt exists as to the number of species of A. The Llama and the Vicugna (q. v.) are universally admitted to be distinct; but it is not so certain that the Alpaca is more than a mere variety of the llama, or that the Guanaco (q. v.) or Huanaca is not the llama in its wild state, although the observation of M. d'Orbigny, who resided long in their native country, that in no circumstances do these animals breed together, is of great importance with reference to this question. As to the Hueque or Chilhueque—the Chilian sheep of some old authors—perhaps too much dependence has been placed on imperfect descriptions, and further information would seem to be requisite ere any place can be assigned to it.—The genus A. is by some naturalists called *Llama*.

AUCHTERA'DER, a village in the south-east of Perthshire, on the west side of the Scottish Central Railway. Population 2520, chiefly employed in cotton-weaving. The popular opposition to the presentee to the church of A. originated (1839) the struggle which ended in the secession from the Church of Scotland and the formation of the Free Church in 1843.

AU'CKLAND, BISHOP, a small town in the middle of the county of Durham. Pop. about 4400. It stands on an eminence, 140 feet above the plain of the Wear. A. contains the abbey-like palace of the Bishop of Durham.

AU'CKLAND, LORD, WILLIAM EDEN, an able statesman and diplomatist, third son of Sir Robert Eden, Bart., of West Auckland, Durham, born in 1744, educated at Eton and Oxford, and called to the bar in 1768. In 1772, he became Under-secretary of State, and one of the directors of Greenwich Hospital; was chosen M. P. for Woodstock; and in March 1776 appointed a lord of trade. In 1778, he was nominated, with the Earl of Carlisle and Governor Johnstone, a commissioner to treat with the insurgent colonists of North America, but without

success. When the former was, in December 1780, named Lord Lieutenant of Ireland, he accompanied him as chief secretary, and remained there till April 1782. Accredited in 1785 minister plenipotentiary to the court of France, he concluded a commercial treaty with that country in September 1786; and in the following August signed a convention for preventing disputes between the subjects of the two crowns in the East Indies. In 1788, he went as ambassador to Spain; and on his return in October 1789, he was created an Irish peer as Baron A. In 1790 he was ambassador to Holland, and in May 1793 was created a British baron. From 1798 to 1801, he was joint Postmaster-general. He died suddenly, May 28, 1814. A. was the author of the *Principles of the Penal Law* (1771, 8vo); *Four Letters*, addressed to the Earl of Carlisle, on temporary political subjects (1779); *Remarks on the Apparent Circumstances of the War* (1795); *Speech on the Income-tax* (1799); *Speech in Support of the Union with Ireland* (1800); and other pamphlets.

AU'CKLAND, EARL OF, GEORGE EDEN, Governor-general of India, son of William Eden, Lord Auckland, born August 25, 1784, was called to the bar in 1809; succeeded his father in 1814 as Lord A.; and in November 1833 was appointed, in Earl Grey's administration, President of the Board of Trade and Master of the Mint. In July following, in Viscount Melbourne's first ministry, he became First Lord of the Admiralty. He vacated that office in November of the same year, but was appointed to it again in 1846. In 1835, he went out to India as governor-general, on which occasion he was made a Knight Grand Cross of the Bath; and in 1839 advanced a step in the peerage, being created Earl of A. and Baron Eden. He returned to England in 1841, and in 1843 was elected president of the Asiatic Society. He died unmarried, January 1, 1849, when the earldom became extinct, and the barony of A. devolved on his brother, Robert John Eden, born in 1804; Bishop of Bath and Wells, 1854.

AU'CKLAND, the capital of New Zealand, standing on the more northerly island in lat. 36° 50' S., and long. 174° 50' E. A. was founded in 1840, and by 1856 it contained 7000 inhabitants. In 1857, the imports were £271,613, and the exports £93,454. Ships inwards were 60 of 16,420 tons; and outwards, 47 of 8402. The native vessels registered were 51, averaging rather more than 20 tons each. The temperature appears to be singularly equable. The mean of the coldest month is 51° F., and that of the warmest 68°. Annual depth of rain is 4½ inches; and the days with rain are 100.

AU'CKLAND ISLANDS, a group of islands to the south of New Zealand, being about the 51st parallel S., and the 167th meridian E. The largest of them measures 30 miles by 15. It has two good harbours, and is covered with the richest vegetation. The A. I. are valuable chiefly as a whaling station, being at the confluence, as it were, of the Pacific and Southern Oceans.

AU'CTION (Lat. *auctio*). The character of this convenient mode of offering property for sale is correctly indicated by the name. The Latin word *auctio* means 'an increasing or enhancement,' and an A. is an arrangement for increasing the price by exciting competition amongst purchasers. What is called a *Dutch Auction*, in which the usual mode of proceeding is reversed, the property being offered at a higher price than the seller is willing to accept, and gradually lowered till a purchaser is found, is thus no A. at all in the original and proper sense of the term. The A. is of Roman origin, and is said to have been first introduced for the purpose

of disposing of spoils taken in war. Such sales were said to take place *sub hastâ* (under the spear), from the custom of sticking a spear into the ground, probably to attract purchasers to the spot. 'Conditions of Sale,' or 'Articles of Roup,' as they are called in Scotland, constitute the terms on which the seller offers his property, and form an integral part of the contract between seller and purchaser. The contract is completed by the offer or bidding on the part of the purchaser, and the acceptance by the seller or his representative, which is formally declared by the fall of the auctioneer's or salesman's hammer, the running of a sand-glass, the burning of an inch of candle (hence the term 'sale by the candle'), or any other means which may have been specified in the conditions of sale. These conditions or articles ought further to narrate honestly and fully the character of the object or the nature of the right to be transferred, to regulate the manner of bidding, prescribe the order in which offerers are to be preferred, and to name a person who shall be empowered to determine disputes between bidders, and in cases of doubt to declare which is the purchaser. Before the sale commences, these conditions, which are executed on stamped paper, are read over, or otherwise intimated to intending purchasers. The conditions, thus published, cannot be controlled by any verbal declaration by the auctioneer. The implied conditions, which, in addition to those thus expressed, are binding on the seller and purchaser in all auctions, are: 1. That the seller shall not attempt to raise the price by means of fictitious offers, but shall fairly expose his goods to the competition of purchasers; and 2. That the purchasers shall not combine to suppress competition. Much doubt has arisen as to the lawfulness of biddings for the exposer. The exposer may set a price below which the thing is not to be sold, which is best and most openly done by fixing an upset price, or he may expressly reserve to himself a power to offer. 'But if the sale is declared to be without reserve, or at the pleasure of the company, the plain meaning and effect of this, even in England, is held to be to bar all biddings in behalf of the seller.' 'In Scotland, the law condemns absolutely such interference.' 'It has been said, that if there be no upset price, and no agreement to sell at the pleasure of the company, the owner may bid, but that is not law, or is at least too broadly laid down.' Bell's *Commentaries*, i. 97, edit. 1858. The A. duties were repealed by 8 and 9 Vict. c. 15.

AUCTIONEER, the person who conducts an auction (q. v.). The A. is in a certain sense the agent both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated. The A. may also, and frequently does, act as agent for absent purchasers, or for persons who have instructed him to make biddings for them during the sale. In both cases, however, the purchaser must be *bonâ fide*, otherwise the A. would himself become a 'puffer.' As to the circumstances in which he may bid for the seller, see AUCTION. When the A. declines or omits to disclose the seller's name, he undertakes his responsibilities to the purchasers. To the seller, again, he is responsible for ordinary skill, assiduity, and prudence. Every A. pays an annual duty of £10 to government for his licence, which must be renewed on the 5th July; though there are certain judicial sales which may be conducted by bailiffs without licence (see 19 Geo. III. c. 56, s. 3, and later Stamp Acts).

AUCUBA, a genus of plants of the natural order

Cornaceæ (q. v.), of which the only known species is *A. Japonica*, an evergreen shrub resembling a laurel, but with dichotomous or verticillate yellow branches, and, as seen in Europe, always with pale green leaves curiously mottled with yellow. It is dioecious, produces its small purple flowers in summer, and ripens its fruit, a small red drupe, in March. It is a native of China and Japan, and was originally introduced into Britain as a stove-plant, but is found to be at least as hardy as the common laurel, and is now a very common ornamental shrub, especially in the suburbs of large towns, a sort of situation for which it is particularly adapted, as it is very little liable to suffer injury from smoke. It is often called the Variegated Laurel. The mottled appearance of the leaf is said, however, not to belong to the plant in its ordinary natural state; but only this variety has yet been brought to Europe, and of it only the female plant.

AUDE'US, ADRI'US (or, according to his native Syriac name, *Udo*), the founder of a religious sect in Mesopotamia, flourished during the 4th c. He commenced by accusing the regular clergy of worldliness, impure morals, &c., and is said to have opposed to their manner of life a strict asceticism, until his conduct seemed dangerous to the welfare of the church, when he was excommunicated. His disciples, who were pretty numerous, now clung more closely to him, and he was elected their bishop. In 338 A. D., he was banished to Scythia, where he instituted a kind of rival church, and where he died about 370 A. D. Our knowledge both of his character and opinions is derived solely from inimical authorities, such as Augustine, Athanasius, &c., and is therefore to be accepted with caution. But his labours amongst the fierce barbarians in the north are acknowledged to have been beneficial, and one writer, Epiphanius, states that he ought to be considered *schismatical*, but not *heretical*. But if the leading feature of his system was, as is alleged, a decided tendency to anthropomorphism, we cannot see—according to the principles upon which the church usually proceeded—why he should not have been so called. He is said to have held that the language of the Old Testament justifies the belief that God has a sensible form—a doctrine deemed heretical in all ages of the church's history. This particular tenet took firm hold on many minds, and in the subsequent century, was widely spread through the monasteries of Egypt.

AUDE (*Atar*), a river in the south of France, rises in the east Pyrenees, not far from Mont Louis; flows for some time parallel to the canal of Languedoc; and falls into the Mediterranean 6 miles east-north-east of Narbonne, after a course of more than 120 miles.

AUDE, a maritime department in the south of France. It comprises some old 'counties' which formerly constituted a portion of the province of Languedoc. Pop. 353,633. Area, 438 square miles. The southern part of A. is mountainous, but the greater portion of it belongs to the valley of the lower A. and the canal of Languedoc. Its northern boundary is formed by the Black Mountains, the most southerly offsets of the Cevennes. The coast is flat, with no bays or roadsteads, but several lagunes. The climate is warm but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. A. is rich in iron and coal, and mineral springs. The woollen and silk manufactures are of considerable value. There is likewise a considerable export of corn, honey, &c. The chief town is Carcassonne.

AUDEBERT, JEAN BAPTISTE, a distinguished French naturalist, was born in 1759 at Rochefort; studied the arts of design and painting at Paris; and in early life attained a degree of eminence as a miniature painter. Indulging a predilection for the study of natural history, he was much employed by naturalists in painting the more rare and beautiful objects in their collections. In 1800, after having visited England and Holland for the purpose of making sketches, he published at Paris, on his own account, a splendid volume, which raised him at once to celebrity, both as a painter and author. This work, the *Histoire Naturelle des Singes, des Makis, et des Galéopithèques* (Natural History of Monkeys, Lemurs, and Flying Lemurs), was a large folio, with 62 coloured plates, remarkable alike for their truth and beauty. His method of colour-printing in oil, which was then novel but now common, was to dispose all the colours on one plate instead of using a separate plate for each colour. His use of gold and bronze in the illustrations and letterpress was then also as new as it is attractive. In his *Histoire des Colibris, des Oiseaux-mouches, des Jacanars, et des Promérops* (Natural History of Humming-birds, Jacamars, and Promeropses), he succeeded by the same process in giving to his plates even a greater brilliancy and finish. He died in 1800.

AUDITOR. The name given to certain officers appointed to examine accounts in behalf either of the government, of courts of law, of corporations, or of private persons—AUDIT-OFFICE. In 1785 public auditors were appointed under the title of 'Commissioners for Auditing the Public Accounts,' by 25 Geo. III. c. 52, by which the patents of Lord Sondes and Lord Mountstuart, as *auditors of the imprests*, were vacated, the sum of £7000 per annum being made payable to each of them for life, in lieu of a percentage which had been paid them on the amount of expenditure audited. Many subsequent statutes have been passed for the purpose of extending and defining the duties of these commissioners, and regulating the business of the audit-office. The commissioners of audit are empowered to call on all public accountants to account for moneys or stores intrusted to them; and should they fail to do so, are required to certify their names to the Remembrancer of the Exchequer, and the Attorney-general of England or Ireland, or the Lord Advocate of Scotland, in order that they may be proceeded against as defaulters. These proceedings, however, may be stayed for a time by the Lords of the Treasury, by whom the whole arrangements of the audit-office are controlled, on the application of the accused. The accounts of the Ordnance, of the Army and Navy, and the Land Revenue, are now subjected to examination in the audit-office. By 2 Will. IV. c. 99, the powers and functions of the Commissioners of Public Accounts in Ireland were transferred to the Commissioners for Great Britain. The present establishment at the audit-office consists of a chairman, five commissioners, a secretary, and a large number of inspectors and examiners. The patronage is in the Lords of the Treasury—AUDITOR OF THE COURT OF SESSION, in Scotland, is an officer whose duties consist in taxing the costs of suits in which expenses are found due, a remit being made to him for that purpose, either by a division of the court or a Lord Ordinary. The auditor returns a report to the judge or court making the remit, by whom decree is pronounced for the amount of the taxed account. Objections to the auditor's report may be stated to the judge or court. The nomination of the auditor is in the crown, the office being held *ad vitam aut culpam*. The auditor cannot practise before the court, on pain of deprivation. The persons eligible to the office are writers to the signet, and solicitors before the

Supreme Courts in Scotland. In the inferior courts an officer with corresponding powers is usually appointed by the court in which he officiates. The office of auditor of the Court of Session corresponds in many respects to that of the taxing-masters in the Court of Chancery, and of the masters of the Queen's Bench and Common Pleas.

AU'DITORY NERVE. By anatomists, the A. N. is associated with the facial, and is the seventh in order of origin from the brain, counting from before backwards. The seventh pair consists of the portio dura or facial, the portio mollis or auditory, and a small intermediate portion. The portio mollis apparently commences by some white streaks in the floor of the fourth ventricle; it then runs forward to the back of the petrous portion of the temporal bone, and enters the internal auditory meatus. The facial then leaves it to pass along the canal called the Aqueductus Fallopii, and the auditory divides into two portions, which diverge—the smaller one posterior for the semicircular canals and the vestibule, the other for the cochlea. Those entering the semicircular canals divide into five branches, forming at last a nervous expansion somewhat analogous to the retina. Figs. 1 and 2 represent the A. N. (1) dividing into its two portions, the lesser branch supplying the semicircular canals (2), the larger branch supplying the cochlea (3). Fig. 1 represents the semicircular canals of the left side, with their bony rings round the membranous labyrinth. In this figure, the cochlea is cut in half longitudinally from the base to apex, shewing a section of the spiral canal, with the nerve proceeding up through its

Fig. 1.—Left Auditory Nerve.

axis. Fig. 2 represents the membranous labyrinth (2), with the bony framework cut away, and with the cochlea opened so as to shew the manner in which the nerve spreads out in the spiral lamina.

Several theories have been held at different periods with regard to the manner in which the nerves terminate in the cochlea, and how sound is transmitted from the latter to the brain. The latest, and that which is at present entertained by most physiologists, is that of M. Schultze. It has been shewn by actual experiment, that when a nerve in connection with a muscle is acted upon by a succession of very rapid strokes from the little hammer of a tetanomotor, and when the strokes have arrived at a certain number in the second, a stimulus is sent along the nerve exciting the muscle to action. It is in the same way that M. Schultze supposes the impression of sound to be propagated to the nerves of the cochlea, by means of a series of little tetanomotors called the teeth of Corti, who discovered them. They are situated in the spiral lamina, which separates the spiral canal in the interior of the cochlea

into a *upper and lower half or scala. The spiral lamina consists of an osseous septum, next to the central axis of the cochlea, and of a membranous

La-Roche-sur Yon in Poitou, in the same year, and died a few months after. The Prince attended his funeral obsequies at Poitiers.

Fig. 2.—Right Auditory Nerve.

layer, which prolongs the osseous septum to the outer wall of the cochlea, thus completing the spiral lamina. This membranous septum is double, and between its layers there is a chamber which contains the teeth of Corti, ranged side by side throughout the whole length of the spiral lamina, and gradually getting shorter from base to apex, like the strings of a harp or pianoforte. The chamber is filled up by a tremulous jelly-like fluid. The diagram, fig. 3, represents a perpendicular section of the spiral

Fig. 3.

a, the osseous septum grooved for the passage of the cochlear nerve *b*, which terminates by a free end inside the chamber *c*, along the floor of which it lies for a short distance; *d, d* are the two layers of the membranous septum. Lying in contact with the end of the nerve is the enlarged extremity of a rod *e*, which is connected in a hinge-like manner by the hinge *f* to another rod, which is fixed at *g*.

lamina. When the waves or vibrations of sound strike against the bones of the head, those bones are caused to vibrate; this vibration is transmitted through the head to the bones of the cochlea, which in turn set in motion the tremulous jelly which fills up the membranous chamber, *c*.

AU'DLEY, SIR JAMES, one of the original knights of the Order of the Garter, founded in 1344 by Edward III., on his return from France after the victory of Cressy, was frequently in personal attendance on Edward the Black Prince, whom he accompanied to France in 1346. He was so conspicuously brave at the battle of Poitiers, that the prince retained him as his own knight, and declared him to be the bravest soldier on his side. He conferred on him an annual revenue of 500 marks, which A. immediately gave up to his squires. This act of disinterestedness becoming known, the Black Prince conferred a further annual sum of 600 marks upon him. A. also accompanied the Black Prince into Spain, and in 1369 the office of seneschal of Poitou was conferred upon him. He took part in the capture of

AUDRAN, GÉRARD, one of the most celebrated engravers of the French school, was born at Lyon in 1640. He belonged to a family distinguished for its excellence in this department of art. After a three years' residence at Rome, where he studied under Carlo Maratti, and acquired a high reputation by his engraving of Pope Clement IX., he was recalled to France by Colbert, and was appointed engraver to his majesty Louis XIV. Here he engraved the principal works of Lebrun, with whom he lived on terms of the closest friendship. His master-pieces are a series of engravings illustrating the battles of Alexander. He died at Paris 1703.

AUDUBON, JOHN JAMES, a distinguished American ornithologist, was born in Louisiana, United States, in May 1780, where his parents, who were both French, had settled on a plantation. His father, who was himself an ardent lover of nature, early directed his son's attention to natural objects. The youth conceived a passion for the study of birds; and a book of ornithological specimens determined him to become a draughtsman. About the age of fourteen, he went to Paris, and studied for some time under the celebrated David. In 1798 he was settled on a farm in Pennsylvania by his father, but he did not distinguish himself as an agriculturist. In 1810 he sailed down the Ohio with his wife and child, on a bird-sketching expedition. The following year, he visited Florida for a like purpose; and for many years after he continued his ornithological researches among the American woods, to the neglect of his ordinary business. The latter he finally abandoned; and in 1824 he went to Philadelphia, where he was introduced to Prince Charles Lucien Bonaparte, who so warmly encouraged him in his plans that he determined on publication. After two years' further exploration of the forests of his native country, he came to Europe with the view to secure subscribers for his work on *The Birds of America*. He met with a warm reception from such men as Herschel, Cuvier, Humboldt, Brewster, Wilson, and Sir Walter Scott. The issue of his work was commenced shortly after, each bird being delineated life-size. The coloured engravings were chiefly executed by the late Mr. W. H. Lizars of Edinburgh. The work was completed in 87 parts, elephant folio, containing 448 plates. While the work was in process of publication in this country (it was finished in 1839), A. revisited America three times, in order to make further researches. In 1831, he began the publication of his *American Ornithological Biography* in Edinburgh, which was also completed in 1839. In 1839, A. finally returned to America, where, in 1844, he published a reduced edition of his works. Assisted by Dr. Buchanan, he also published *The Quadrupeds of America*, and a *Biography of American Quadrupeds*. He died, January 27, 1851, in his 71st year.

AUER, ALOIS, director of the National Printing-office at Vienna, was born May 11, 1813, at Wels, in Upper Austria, and was trained in a printing establishment of his native town to be a compositor, corrector, and manager. He thus went through all the grades of his profession. During his scanty leisure moments, A. employed himself in acquiring a knowledge of French, Italian, English, and other languages, in which he underwent an examination

in 1835 and 1836, before the university of Vienna. His brilliant appearance on this occasion opened up to his ambition the probability of a professorial chair. In October 1837, he was appointed professor of Italian in the college at Linz, in Upper Austria. Here he laboured assiduously in public and private teaching, and published a variety of useful school-books, on a system peculiar to himself. In 1839 he set out on his travels through Germany, Switzerland, France, and England, collecting materials for his favourite art. On his return he was appointed, in 1841, to the office which he now holds. As a specimen of his typographical learning, and the resources of the office under his care, A. has printed and published the *Sprachalle, or Lord's Prayer in 608 languages*, with Roman types (Vienna, 1844); and the *Lord's Prayer in 200 languages*, with their national alphabets (1847).

AUERBACH, BERTHOLD, a popular German author, of Jewish extraction, was born at Nordstetten, in the Würtemberg Black Forest, February 28, 1812. He received his education at Carlsruhe, Stuttgart, Tübingen, Munich, and Heidelberg. Having at an early period abandoned the study of Jewish theology, he devoted his attention to literature. His first publications, *Judaism and Modern Literature* (Stuttg. 1836), and a translation of the works of Spinoza, with a critical life of his author (5 vols. Stuttg. 1841), had a philosophical tendency. In his *Educated Citizen* (Carlsruhe, 1842), and *Village Tales of the Black Forest* (1843), he applied himself to the portraiture of (real life, and succeeded well. The *Village Tales* were translated into English, Swedish, and Dutch, and were generally admired. One of his later publications, *Schrift und Volk* (Literature and the People, 1846), discusses the relation in which literature stands to the mass of the people.

AUGÉAS, or AU'GEIAS, according to one account, the son of Helios and Iphiboë, but according to others, of Phorbas and Hermione, was king of Elis, and renowned for his wealth in oxen, of which he fed 3000 head in his stables. When the dung of these animals had been allowed to accumulate for many years, Hercules was commissioned by Eurystheus to cleanse the Augean stables in one day, and was promised as payment a tenth part of the oxen. Hercules accomplished the task, by turning the courses of the rivers Peneus and Alpheus through the masses of ordure. When A. refused to pay the stipulated wages, a war ensued, and A. was slain by Hercules. The fable of the Augean stables often serves as an allusion in declamations on political corruptions, &c.

AUGEREAU, PIERRE FRANÇOIS CHARLES, Duke of Castiglione, marshal and peer of France, one of the most brilliant and intrepid of that band of general officers whom Napoleon gathered around himself, was the son of a tradesman, and was born 21st October 1757. After serving some time in the French carabiniers, into which he enlisted at the age of seventeen, he entered the Neapolitan service, in which he remained until 1787, when he settled in Naples as a fencing-master. With other French residents, he was banished from that city in 1792, and immediately volunteered into the French revolutionary army intended for the repulsion of the Spaniards. His services were so conspicuous, that in less than three years he was made general of a division. In 1795 he accompanied the army to Italy, where he greatly distinguished himself, especially in the field, but also in the council. He took an active part and gained much glory in the battles of Millesimo, Ceva, Iodi, Castiglione (for which he received his title), Roveredo, Bassano, &c. In 1797 he was appointed

to the command of the Army of the Rhine; but in a few months after, the Directory not liking the spirit he displayed there, made him commander of the tenth division at Perpignan. This post he resigned in 1799, when he was elected as deputy into the council of the Five Hundred. In 1801 he received the command of the army in Holland, and was active in several engagements. In 1804 he was made a marshal; and in the following year he commanded a division of the army which reduced the Vorarlberg; and was afterwards engaged at Wetzlar, Jena, Eylau; also in Italy (1809); Spain (1810); Berlin, Bavaria, and Saxony (1813). He died of water in the chest, June 11, 1816.

AUGITE (from Gr. *augé* brilliancy), or PYROXENE (from Gr. *pyr*, fire, and *xenos*, a stranger), a mineral very nearly allied to Hornblende (q. v.), which has, indeed, by some mineralogists been regarded as a variety of it, although the distinction between them is undeniably important, as characterising two distinct series of igneous rocks. A. consists of 47—56 per cent. of silica, 20—25 per cent. of lime, and 12—19 per cent. of magnesia, the magnesia sometimes giving place in whole or in part to protoxide of iron, and some varieties containing a little alumina, or a little protoxide of manganese. Its specific gravity is 3.195—3.525. It is little affected by acids, or not at all. It is usually of a greenish colour, often nearly black. It crystallises in six or

a, Common Augite; b, Green Augite.

eight-sided prisms variously modified; it often occurs in crystals, sometimes imbedded, often in grains or scales. It is an essential component of many igneous rocks, particularly of Basalt (q. v.), Dolerite (q. v.), and A.-porphyry (see PORPHYRY), from which chiefly it derives its importance as a mineral species. A. Rock, consisting essentially of A. alone, occurs in the Pyrenees. A. is a common mineral in the trap-rocks of Britain and other countries. It is rarely associated with quartz, in which respect it differs from hornblende, but very often with labradorite, olivine, and leucite. Fluorine, which is generally present in small quantity in hornblende, has never been detected in A. The form of the crystals is also different in the two minerals, as well as their cleavage; but Professor Gustav Rose of Berlin has endeavoured to shew that the difference between A. and hornblende arises only from the different circumstances in which crystallisation has taken place, and that A. is the production of a comparatively rapid, and hornblende of a comparatively slow cooling. He regards some of the varieties as intermediate. His views have been supported by experiments, and by a comparison of A. with certain crystalline substances occurring among the scoræ of foundries.—*Diopside*, *Sahlite*, and *Coccolite* are varieties of A.—*Diallage* (q. v.) and *Hypersthene* (q. v.) are very nearly allied to it. AUGMENTATION, in Heraldry. See HERALDRY.

AUGMENTATION, in Music, is the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of

greater length than those notes in which the melody is first introduced. The tempo remains unaltered. A. is of great importance in the treatment of the subjects, or themes, for fugues, and when cleverly used, produces great effects.

AUGMENTATION, Process of, in Scotch law, is an action in the Court of Teinds (q. v.) by the minister of a parish against the titular, or beneficiary, and heritors, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. By 48 Geo. III. c. 138, it is enacted that no A. shall be granted till the expiration of 15 years from any A. previous to the act, nor till the expiration of 20 years from any A. subsequent to the act. A period of 20 years must thus elapse between each augmentation. The amount of the A. is fixed, or modified, as it is termed, in grain or virtual; the stipend itself being paid in money, according to the fiars' prices (q. v.) of each year. In addition to the ascertainment or modification of a suitable stipend, regard being had to the state of the teinds, the extent of the parish, the expense of living, and the like—a process of A. has the further object in view of *localling* the stipend so modified—i. e., of assigning it in due proportions to the heritors or other parties in possession of the tithes. This latter object is attained by means of what is called a scheme of locality—i. e., an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior Lord Ordinary (q. v.), on a remit from the Teind Court. The last conclusion in a summons of A. is for a suitable sum, or increase to the sum already allowed, for communion elements—i. e., for bread, wine, and other necessities for celebrating the sacrament of the Lord's Supper after the Presbyterian fashion. When there is not a sufficient amount of teind to bring the stipend of the minister up to £150 per annum, with £8, 6s. 8d. for communion elements, it is provided by 50 Geo. III. c. 84, and 5 Geo. IV. c. 72, that the residue shall be paid by the Exchequer. In addition to their stipend, ministers have right to a manse and glebe, or a provision of £50 annually in lieu of them. See **STIPEND**, **GLEBE**, **MANSE**; see also **PARLIAMENTARY CHURCHES**.

AUGSBURG, historically one of the most notable cities in Germany, is situated in the angle between the rivers Wertach and Lech, and is the chief city of the circle of Swabia and Neuburg, in the kingdom of Bavaria. Population in 1864 was 49,332. Though presenting an antique and rather deserted appearance, A. has numerous fine buildings, and especially one noble street, the 'imperial' Maximilian Strasse, adorned with bronze fountains. Various buildings are associated with historical events of world-interest. The industry of A. is reviving; several cotton and woollen factories are in operation, as well as manufactories of paper, tobacco, and machinery. Its gold and silver wares still retain their ancient reputation. The once flourishing art of copper engraving is extinct; but printing, lithography, and bookselling have taken a new start. The *Allgemeine Zeitung*, or Augsburg Gazette, the most widely circulated paper in Germany, is published here. Banking and stock-jobbing are extensively carried on; and it is still the emporium of the trade with Italy and Southern Germany. It is the centre of a system of railways connecting it with Nürnberg and Leipsic, with Switzerland, Munich, &c. The foundation of A. was the 'colony' planted by the Emperor Augustus, 12 B. c., after the conquest of the Vindelici, probably on the site of a former residence of that people.

It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rætia, was laid waste by the Huns in the 5th c., and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed. After the division of Charlemagne's empire, it came under the Duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became, in 1276, a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the end of the 14th c. About this time (1388), its aristocratic government was set aside for a democratic, which lasted for 170 years, till the aristocracy, favoured by Charles V., regained the ascendancy. A. continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nürnberg it formed the emporium of the trade between Northern Europe and the south, and its merchants were princes whose ships were in all seas. See **FUGGER**. It was also the centre of German art as represented by the Holbeins, Burkmaier, Altdorfer, and others. Many diets of the empire were held in A., and the leading events of the Reformation are associated with its name. The discovery of the road to India by the Cape, and of America, turned the commerce of the world into new channels, and dried up the sources of A.'s prosperity. It lost its freedom with the abolition of the German empire in 1806, and was taken possession of by Bavaria.

AUGSBURG CONFESSION, the chief standard of faith in the Lutheran Church. Its history is the following. With a view to an amicable arrangement of the religious split that had existed in Germany since 1517, Charles V., as protector of the church, had convoked a diet of the empire, to meet at Augsburg, 8th April 1530, and had required from the Protestants a short statement of the doctrines in which they departed from the Catholic Church. The Elector, John, of Saxony, therefore, in March, called on his Wittenberg theologians, with Luther at their head, to draw up articles of faith, to lay before him at Torgau. The commissioned doctors took as a basis, in so far as pure doctrine was concerned, articles that had been agreed to the previous year at conferences held at Marburg and Schwabach, in the form of resolutions of the Lutheran reformers of Germany against the doctrines of Zwingli. These doctrinal articles supplemented, and with a practical part newly added, were laid before the Elector at Torgau. Melancthon then, taking the Torgau articles as a foundation, began in Augsburg, in May, and with the advice of various Protestant theologians, as well as princes and other secular authorities, composed the document, which he first called an Apology, but which in the diet itself took the name of the A. C. Luther was not present in Augsburg, being then under the ban of the empire, but his advice was had recourse to in its composition. The Torgau articles were in German; the Confession was both in German and Latin; and Melancthon laboured incessantly at its improvement till it was presented to the emperor, June 25. The character of Melancthon, in the absence of Luther, had led him, in setting about the composition of the document, to aim at maintaining a spirit of love, forbearance, and mediation, as well as the utmost brevity and simplicity. Its object, which only became gradually apparent after the meeting of the diet, was, in the first place, to give a collected view of the belief of the Lutheran Protestants, aiming at the same time at refuting the calumnies of the Catholics, and at laying a foundation for measures of reconciliation.

The first part of the confession contained 21 articles of faith and doctrine: 1. Of God; 2. Of Original Sin; 3. Of the Son of God; 4. Of Justification; 5. Of Preaching; 6. Of New Obedience; 7 and 8. Of the Church; 9. Of Baptism; 10. Of the Lord's Supper; 11. Of Confession; 12. Of Penance; 13. Of the Use of Sacraments; 14. Of Church Government; 15. Of Church Order; 16. Of Secular Government; 17. Of Christ's Second Coming to Judgment; 18. Of Free Will; 19. Of the Cause of Sin; 20. Of Faith and Good Works; 21. Of the Worship of Saints. The second and more practical part, which is carried out at greater length, contains seven articles on disputed points: 22. On the Two Kinds of the Sacrament; 23. Of the Marriage of Priests; 24. Of the Mass; 25. Of Confession; 26. Of Distinctions of Meat; 27. Of Conventual Vows; 28. Of the Authority of Bishops.

This document, signed by some six Protestant princes and two free cities, was read before the emperor and the diet, 25th June 1530. Melancthon, not looking upon the Confession as binding, began shortly after to make some alterations in its expressions; at last, in 1540, he published a Latin edition (*Confessio Variata*) in which there were important changes and additions. This was especially the case with the article on the Lord's Supper, in which, with a view to conciliation, he endeavoured to unite the views of the Lutherans and Calvinists. This gave rise subsequently to much controversy; orthodox Lutheranism repudiated the alterations of Melancthon, and long continued to subject his memory to great abuse; though it is clear that Melancthon and his adherents contemplated no substantial departure in doctrine from the original Confession. It is not certain that the form of the Confession found in the Lutheran standards is identical with the unaltered A. C., as the two original documents—German and Latin—laid before the diet have been lost. The chief distinctions between the Orthodox Lutherans and the reformed churches of Germany has all along been adherence to the 'unaltered' or to the 'altered' Confession. It was even a matter of controversy whether the 'reformed' were entitled to the rights secured to the Protestants by the Religious Peace of Augsburg, concluded in 1555, on the ground of the 'unaltered' Confession.—Though the A. C. is still formally adhered to by the Protestant Churches of Germany, it is confessedly no longer the expression of the belief of the vast majority of the members, after the great advances made by theology, and the many alterations in public opinion and feeling.

AUGSBURG INTERIM. See INTERIM.

AUGURIES AND AUSPICES. These terms are familiar to every reader of Roman history, and are, besides, so frequently employed in English in a secondary and metaphorical sense, that a vague notion of their original meaning is caught up even by those who know nothing of classical antiquities. As, however, the entire religious and political life of the early Romans was deeply penetrated by the influence of their sacred superstitions, and as amongst these auguries and auspices held a prominent place, a clear perception of what they were is a matter of considerable moment. The following statements exhibit, in a condensed form, the substance of what is known on the subject.

Like almost all primitive nations, the Romans believed that every unusual occurrence had a supernatural significance, and contained, hidden in it, the will of Heaven regarding men. To reveal or interpret this hidden will was the exclusive privilege of the augur, who apparently derived his official designation, in part at least, from *avis*, a bird; while Roman history abundantly proves that the observation of the flight of birds was a principal means

adopted for discovering the purpose of the gods. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters—that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a 'college of augurs' figures in the very dawn of Roman history. Romulus, it is almost certain, was an augur himself. He is said to have been skilled in the art of divination from his youth; and by 'divination' we must specially understand augury; for the Romans, with patriotic piety, held all the forms of divination practised in other countries to be useless and profane. Previous to the Ogulnian law, passed in the year 307 B. C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than two hundred years, the number continued the same, till Sulla, in 81 B. C., increased it to fifteen. Finally, in the first days of the Empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first, the augurs were elected by the *Comitia Curiata*; but as the sanction of the former was necessary to give validity to the acts of the latter, they could always 'veto' any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B. C., when a tribune of the people named *Ahenobarbus* carried a law by which it was enacted that for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain picked tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered its prophetic pretensions ridiculous in the eyes of educated people. By Cicero's time, it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurium ex celo. ex avis, ex tripudiis, ex quadrupedibus, ex diris*. The first, related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and held to be of supreme significance. The second related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those consulted, as it was called, were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites*, or birds whose flight revealed the will of the gods; the last four to the class of *oscines*, whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the auguries *ex quadrupedibus*, from four-footed animals—as, for instance, if a dog, or wolf, or hare, ran across the path of a Roman, and startled him by any unusual motion, he mentioned it to an augur, who was expected to be able to advise him what to do; the auguries *ex diris* (a vague kind of augury), from any trifling accidents or occurrences not included in the previous four—such as sneezing, stumbling, spilling salt on the table, &c.

At Rome, the auspices were taken on the summit

of the Capitoline Hill; and the ground on which the augur stood was solemnly set apart for the purpose. The latter then took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari*, to contemplate), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favourable or unfavourable. How vast the political influence and authority of the augurs must have been is seen from the fact, that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid if the auspices were unfavourable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians was held valid—unless the auspices were first taken, while the Comitia of the Centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

We have employed the two terms, *auguries* and *auspices*, as synonymous. But a slight difference is perceptible between them; not the augurs only, but the chief magistrates of Rome (inheriting the honour from Romulus), held the 'auspices,' while the 'auguries' were exclusively in the possession of the former; but the mode of divination, and the end to be obtained by it, seem to have been the same in both cases.

The power of taking the auspices in war was confined to the commander-in-chief; and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, 'under the auspices' of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name.

AUGUST, the sixth month in the Roman year, which began with March, was originally styled *Sextilis*, and received its present name from the Emperor Augustus, on account of several of the most fortunate events of his life having occurred during this month. On this month he was first admitted to the consulate, and thrice entered the city in triumph. On the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. (See Macrobius, i. 12.) As the fifth month, or *Quintilis*, had previously been styled Julius in honour of Julius Cæsar, a day was taken from February to make A. equal with July.

AUGUSTA, a city, seat of justice of Kennebec co., Maine, and capital of the state, at the head of sloop navigation, on the Kennebec River, 43 miles from its mouth. By railroad it is 60 miles N.N.E. of Portland, 67 miles S.W. of Bangor, and 175 N.N.E. of Boston. Lat. 44° 19' N.; lon. 69° 50' W. Augusta has 9 or 10 churches, 4 or 5 banks, and a flourishing female academy. It contains several manufactories, and 8 or 9 hotels. The Portland and Kennebec R.R., connecting Portland with Waterville, passes through Augusta. Pop. in 1860, 7609.

AUGUSTA, a handsome city of Georgia, and capital of Richmond co., on the Savannah River, 231 miles from its mouth, 120 N.N.W. from Savannah, and 136 N.W. from Charleston. Lat. 33° 28' N.; lon. 81° 54' W. It is the second city of the state in population and importance. The Georgia R.R., of which Augusta is the eastern terminus, extends to Atlanta, and the South Carolina R.R. connects it with Charleston. The Augusta Canal, which was constructed in

1845, is 9 miles in length, and brings the waters of the Savannah River some 35 or 40 feet above the level of the city. By the water-power thus furnished, factories, machine-shops, and other such establishments, have been erected. Pop. in 1860, 12,493. Among the remarkable public buildings are the city-hall, which cost \$100,000, the Richmond Academy, a masonic hall, and a medical college. Augusta also contains about 14 churches, a hospital, arsenal, 6 banks, (including a branch of the state bank), and 4 or 5 newspaper offices. A line of steamboats communicates with Savannah. A bridge crossing the river connects the city with Hamburg in South Carolina.

AUGUSTENBURG, a village of 800 inhabitants in the centre of the island of Alsen. It is noted for being the residence of the duke of Holstein-Sonderburg-Augustenburg, for its splendid 'stables,' and for the castle belonging to the ducal family.

AUGUSTI, a learned German theologian, born in 1772 at Eschenberga, near Gotha. He studied at Jena under the celebrated Griesbach, and afterwards devoted himself for some time to public teaching. In 1798, he became lecturer (*privat-docent*) in philosophy, and in 1800 he was appointed professor-extraordinary of the same. Three years after, he succeeded Ilgen in the chair of Oriental Literature; but his love of theological studies becoming predominant, he accepted the offer of a theological professorship in the university of Breslau, where he exerted a wide and beneficial influence. In 1819 he was transferred to Bonn, and made a director of the consistory at Cologne. Other ecclesiastical honours were conferred on him during the course of his life. He died on the 28th April 1841.

In the early part of his career, A. was a decided rationalist; but subsequently he returned to orthodox Lutheranism, more, perhaps, from the conservative bias of his nature, than from any profound conviction of the truth of the national creed. The change, however, was not accompanied, as is usual in such cases, with any intense bigotry. A. remained to the last a liberal-hearted Christian. His writings, marked by great learning, industry, and spirit, are much esteemed by his countrymen. The most important is his *Manual of Christian Archaeology* (Leip. 1836—1837).

AUGUSTINE, AURELIUS ST., the greatest of the Latin fathers, was born at Tagaste, a town of Numidia, on the 13th of November 354 A. D. His father Patricius, was poor, but of good family, and filled the office of magistrate. He continued a pagan till advanced in years, and was only baptized shortly before his death. He does not seem to have been remarkable for any elevation of mind; on the contrary, one may fairly conclude from his son's statements, that he was an irascible, kind-hearted man, more intent on his son's advancement in this world than in that which is to come. His temper often caused great sorrow to his gentle and pious wife, who loved him faithfully, however, and was therefore rewarded with the secret by which she could charm the evil spirit out of him. Patricius was very anxious that A. should become a fine scholar, as he noticed that not a few people in his day were obtaining large incomes by their 'wits.' A. was accordingly sent to school at Madaura, and subsequently to Carthage to complete his studies. Previous to this, however, he had enjoyed the inestimable felicity of a religious education at home. His mother, Monnica, had been his best instructor. Neander truly says: 'Whatever treasures of virtue and worth the life of faith, even of a soul not trained by scientific culture, can bestow, was set before him in the example of his pious mother.'

The energy and penetration of intellect exhibited

by the young A. excited the most flattering hopes. When he left home for Carthage, a joyous, ardent, and resolute student, a bright career of worldly prosperity seemed to open before him. But strong as A. was, the temptations of Carthage were stronger. His nature, deep, impetuous, and passionate, thirsted for excitement. He had just reached the age when happiness is conceived to be synonymous with pleasure, and Carthage, the second city of the empire, was rank as Rome in its sensual corruptions. A. fell. In his *Confessions*, he paints the frightful abyss into which he felt himself plunged; nor does he seek to excuse himself; on the contrary, the shadow of his guilt is thrown forward over all his boyish life, and he displays even a morbid zeal and acuteness in pointing out what others, less censorious, might term the frivolous errors of his childhood, but which seemed to A. the parents of his subsequent vices, and therefore equally bad and equally reprehensible. Before he had reached his eighteenth year, his mistress bore him a son, who was named Adeodatus—afterwards baptised along with him at Milan. The thing which appears to have first stirred his deeper being into life was a passage which he suddenly came across in the *Hortensius* of Cicero, treating of the worth and dignity of philosophy. To use the language of Neander: 'The conflict now began in his soul which lasted through eleven years of his life. As the simplicity of the sacred Scriptures possessed no attractions for his taste—a taste formed by rhetorical studies and the artificial discipline of the declamatory schools—especially as his mind was now in the same tone and direction with that of the Emperor Julian, when the latter was conducted to the Platonic theosophy; as, moreover, he found so many things in the doctrines of the church which, from want of inward experience, could not be otherwise than unintelligible to him, while he attempted to grasp, by the understanding from without, what can be understood only from the inner life, from the feeling of inward wants, and one's own inward experiences; so under these circumstances, the delusive pretensions of the Manichæan sect, which, instead of a blind belief on authority, held out the promise of clear knowledge and a satisfactory solution of all questions relating to things human and divine, presented the stronger attractions to his inexperienced youth.' A. now became a professed Manichæan. Returning to his native town, he lectured for a short time on 'grammar'—that is to say, on literature. Soon afterwards, he returned to Carthage, to pursue his profession under more favourable auspices. Here he wrote, in his twenty-seventh year, his first work, *De Apto et Pulehro*—a treatise on æsthetics, which has unfortunately been lost. About the same time his spiritual nature became keener and more imperative in its demands. The futile speculations of the visionary sect to which he had attached himself now became apparent. He had a series of interviews and conversations with Faustus, one of the most celebrated teachers of Manichæism; and these so utterly disappointed his expectations, that he left the society in disgust and sad bewilderment, after having wasted ten years in a fruitless search for wisdom and truth.

In 383 he went to Rome, followed by the tears, the prayers, and the anxieties of his excellent mother, who was not, however, bereaved of hope, for both her faith and her love were strong. After a short stay, A. left Rome, and proceeded to Milan, where he became a teacher of rhetoric. No change could have been more fortunate. At this time, the Bishop of Milan was the eloquent and devout St. Ambrose. An intimacy sprang up between the two. A. often went to hear his friend preach. He was not,

however, as yet a Christian. He had only emerged, as it were, from Manichæism—the region of night-clouds and shadows—and was now gazing on the gray dawn of the Platonic philosophy, prophetic of the noon-tide splendours of Christianity which were soon to burst upon his vision. Still, A. did not afterwards despise this preliminary training; he was too great and honest a man for that. He confesses that the Platonic writings 'enkindled in his mind an incredible ardour;' they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, although from a purely Platonic point of view, and rather wishing to find in it 'those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form.' He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that 'highest wisdom' which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that 'he himself was continually borne down by the ungodly impulses which he thought he had already subdued,' the necessity of a living personal God and Saviour to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshipped, shone clear through all the stormy struggles of his heart. In the eight and ninth books of his *Confessions*, he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say, that the Spirit of God triumphed. On the 25th of April 387 A.D., A., along with his natural son Adeodatus, of whom he seems to have been justly fond, was baptised by Ambrose at Milan. Shortly after, he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, A. wrote his treatises, *De Moribus Ecclesie Catholice et de Moribus Manicheorum*; *De Quantitate Animæ*; and *De Libero Arbitrio*. It is unnecessary to relate at any length the subsequent life of Augustine. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises—*De Genesi Contra Manichæos*, *De Musica*, *De Magistro*, and *De Verâ Religione*, which secured him a high reputation. In 391, he was ordained a priest by Valerius, Bishop of Hippo; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395, he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. A., as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under PELAGIUS and PELAGIAN CONTROVERSY (q. v.). In 397, appeared his *Confessiones*, in 13 books. It is a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. Passages of it have no parallel except in the Psalms of

David. In 413, he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most powerful work. Exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. A. was an indifferent scholar: he had studied the Latin authors well; but of Greek 'he new little, and of Hebrew, nothing.' Many of his reasonings are based on false and untenable premises, and he erred often in his etymological explanations; but in spite of these and other drawbacks, the final impression left on the mind is, that the work is one of the most profound and lasting monuments of human genius. In 428, A. published his *Retractationes*, in which he makes a recension of all his previous writings. It is a work of great candour. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429 the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. A., now in his seventy-sixth year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He died on the 28th of August 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculations in those unfettered nigh, before creeds were encircled with that traditionary sanctity they now possess. Nevertheless, we have little difficulty in determining the central tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrines of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact (see Neander, Mosheim, and Waddington's Church Histories), that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of A., and thus transmitted to following ages. In his epistle to Dulcitus, a civil magistrate, who shrank from putting in force the edict of Honorius against heretics, he uses these words: 'It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension.' In the opinion of Neander, it was to the somewhat narrow culture, and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematised by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes.

His life has been written by Tillemont, and his entire works have been repeatedly edited. The Benedic-

tine edition, published at Paris in 11 vols. (1679—1700), is the best. Numerous editions of the *Confessiones* and the *De Civitate Dei* have also appeared. In the 'Library of Fathers of the Holy Catholic Church,' published by J. H. Parker, there are translations into English of A.'s *Confessions*, *Exposition on St John's Gospel*, and on the *Psalms*, *Sermons on the New Testament*, and *Short Treatises*. His *Sermon on the Mount* has been translated by Trench, and published by Parker and Son.

AUGUSTINE, St., first Archbishop of Canterbury, was originally a monk in the convent of St. Andrew at Rome. In 596 he was sent, along with forty other monks, by Pope Gregory I., to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. The missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the king of the Parisians, was a Christian, and retained a Frankish bishop in her suite as chaplain. A residence was assigned to them at Canterbury, then called *Durovernum*, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day A. baptised 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact, that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labours of A. and his companions.

In 597 he went to Arles, by direction of the pope, and was there consecrated Archbishop of Canterbury and Metropolitan of England. On his return, he despatched a presbyter and monk to Rome, to inform the pope of his success, and obtain instruction on certain questions. Gregory's advices with regard to the propagation of the faith are admirable examples of that pious ingenuity which has often characterised the missionary policy of the Church of Rome. Thus, instead of destroying the heathen temples, A. was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. A.'s subsequent efforts to establish his authority over the native British church were not so successful as his missionary labours. He died in 604, and was buried in the churchyard of the monastery bearing his name, founded by King Ethelbert. His body was removed to the cathedral of Canterbury in 1091. Bede's *Historia Ecclesiastica Gentis Anglorum* is the great authority for the life of St. Augustine. A thoughtful and pleasing sketch of it will be found in the Rev. Arthur P. Stanley's *Historical Memorials of Canterbury*. Lond. 1855.

The site and remains of St. A.'s monastery were purchased in 1844 by Mr. Beresford Hope, by whom they were presented to the Archbishop of Canterbury in trust, for the erection of a missionary college in connection with the Church of England. This institution was incorporated by royal charter in 1848. The buildings, in which as much of the ancient structure as possible has been preserved, contain accommodations for about 45 students, whose course of study extends over three years. Twenty exhibitions have been founded in connection with the college.

AUGUSTINES, or AUGUSTINIANS, names given to several religious bodies in the Roman Catholic Church. Whether St. Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as thirty monastic fraternities, of which the chief were the Canons Regular, the Knights

Templars (q. v.), the Begging Hermits, the Friars Preachers or Dominicans (q. v.), and the Premonstratensians (q. v.). The CANONS REGULAR OF ST. AUGUSTINE, or AUSTIN CANONS, appear to have been founded or remodelled about the middle of the 11th c. Their discipline was less severe than that of monks properly so called, but more rigid than that of the secular or parochial clergy. They lived under one roof, having a common dormitory and refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. In England, where they were established early in the 12th c., they had about 170 houses, the earliest, it would seem, being at Nostell, near Pontefract, in Yorkshire. In Scotland, they had about 25 houses: the earliest at Scone was founded in 1114, and filled by canons from Nostell; the others of most note were at Inchcolm in the Firth of Forth, St. Andrews, Holyrood, Cambuskenneth, and Inchaffray.

THE BEGGING HERMITS, HERMITS OF ST AUGUSTINE, or AUSTIN FRIARS, were a much more austere order, renouncing all property, and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the 11th and 12th centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the rival fraternities of Dominicans and Franciscans, Pope Innocent IV., about the middle of the 13th c., imposed on them the rule of St Augustine, whom they claimed as their founder. In 1256, Pope Alexander IV. placed them under the control of a superior or president called a 'general.' In 1287, a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570, Friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalcenti*, or 'barefooted friars.'

The degeneracy of the order in the 14th c., called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. But in his day, even these had fallen victims to the general corruption of the priesthood, and he inflicted serious injury upon it by his unsparing denunciations. After the French Revolution, the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and Southern Germany. It was diminished even in Austria and Naples. It is most powerful in Sardinia and America.

The name of AUGUSTINES was given also to an order of nuns who claimed descent from a convent founded by St Augustine at Hippo, and of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. The Hôtel-Dieu at Paris is still served by them.

AUGUSTULUS, ROMULUS, the last emperor of the western portion of the Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential littleness of his character. He was the son of Orestes, a Pannonian of birth and wealth, who rose to high rank under the Emperor Julius Nepos, whose favour he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the emperor, Orestes conferred the vacant throne on his son A. (476 A. D.), retaining all substantial power in his own hands. Orestes, failing to conciliate the barbarians, who had helped him against Nepos, with a grant of the third of the lands of Italy, they, under the command of Odoacer, besieged him in Pavia, and capturing, put him to death. A. yielded at once, and being of too little consequence to be put

to death, he was dismissed to a villa near Naples with an annual pension of 6000 pieces of gold. His after-fate is unknown.

AUGUSTUS, CAIUS JULIUS CÆSAR OCTAVIANUS, the son of Octavius and Atia (daughter of Julia, the younger sister of Julius Cæsar), was born 23d September B. C. 63. The Octavian family came originally from Velitræ, in the country of the Volsci; and the branch from which A. descended was rich and honourable. His father had risen to the rank of senator and prætor, but died in the prime of life, when A. was only four years old. A. was carefully educated in Rome under the guardianship of his mother and his step-father, Lucius Marcius Philippus. At the age of 12, A. delivered a funeral oration over his grandmother; at 16, he received the toga virilis. The talents of the youth recommended him to his grand-uncle, Julius Cæsar, who adopted A. as his son and heir. At the time of Cæsar's assassination (March 15, B. C. 44), A. was a student under the celebrated orator Apollodorus, at Apollonia in Illyricum, where, however, he had been sent, chiefly with a view to gain practical instruction in military affairs. He returned to Italy, assuming the name of Julius Cæsar Octavianus, and at his landing at Brundisium, was welcomed by deputies from the veterans there assembled; but declining their offers, he chose to enter Rome privately. The city was at this time divided between the two parties of the republicans and the friends of Mark Antony; but the latter had, by adroit manoeuvres, gained the ascendancy, and enjoyed almost absolute power. A. was at first haughtily treated by the consul, who refused to surrender the property of Cæsar. After some fighting, in which Antony was worsted, and had to flee across the Alps, A., who had made himself a favourite with the people and the army, succeeded in getting the will of Julius Cæsar carried out. He found an able friend and advocate in Cicero, who had at first regarded him with contempt. The great orator, while imagining that he was labouring in behalf of the republic, was in fact only an instrument for raising A. to supreme power. When Antony returned from Gaul with Lepidus, A. joined them in establishing a triumvirate. He obtained Africa, Sardinia, and Sicily; Antony, Gaul; and Lepidus, Spain. Their power was soon made absolute by the massacre of those unfriendly to them in Italy, and by victories over the republican army in Macedonia commanded by Brutus and Cassius. After the battle of Philippi, won by A. and Antony, of which the former unjustly claimed all the credit, whereas it mainly belonged to the latter, the triumvirs made a new division of the provinces—A. obtaining Italy, and Lepidus, Africa. The Perusian war, excited by Fulvia, wife of Antony, seemed likely to lead to a contest between A. and his rival; but was ended by the death of Fulvia, and the subsequent marriage of Antony with Octavia, sister of Augustus. Shortly afterwards, the claims of Sextus Pompeius and Lepidus having been settled by force and fraud, the Roman world was divided between A. and Antony; and a contest for supremacy commenced between them. While Antony was lost in luxurious dissipation at the court of Cleopatra, A. was industriously striving to gain the love and confidence of the Roman people, and to damage his rival in public estimation. At length war was declared against the queen of Egypt, and at the naval battle of Actium (q. v.), B. C. 31, A. was victorious, and became sole ruler of the whole Roman world. Soon afterwards, Antony and Cleopatra ended their lives by suicide. The son of Antony by Fulvia, and Cæsarion, son of Cæsar and Cleopatra, were put to death; and in B. C. 29, after disposing of several affairs in Egypt,

Grece, Syria, and Asia Minor, A. returned to Rome in triumph, and closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favour, he abolished the laws of the triumvirate, adorned the city of Rome, and reformed many abuses. At the end of his seventh consulship (B. C. 27), he proposed to retire from office, in order that the old republican form of government might be re-established, but he was ultimately induced to retain his power. Hitherto, since Cæsar's death, the consul had been named Octavian; but now the title of *Augustus* (meaning 'sacred' or 'consecrated') was conferred on him. In the eleventh consulship of A. (B. C. 23), the tribunitian power was conferred on him for life by the senate. Republican names and forms still remained, but they were mere shadows. A. was in all but name absolute monarch. In 12 B. C., on the death of Lepidus, he had the high title of Pontifex Maximus, or High Priest, bestowed on him. The nation surrendered to him all the power and honour that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, &c., A. (9 B. C.) suffered the greatest defeat he had sustained in the course of his long rule, in the person of Quintilius Varus, whose army was totally destroyed by the Germans.

This loss so afflicted A., that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: 'O Varus, restore me my legions!' From this time A. confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, 'A. found the city built of bricks, and left it built of marble.' He also founded cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the Senate, the name Augustus was given to the month Sextilis.

Though surrounded thus with honour and prosperity, A. was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and Marcellus, the son of his sister, and Caius and Lucius, the sons of his daughter, whom he had appointed as his successors and heirs, as well as his favourite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, domestic sorrows and failing health, warned him to seek rest; and, to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (August 19 A. D. 14), in the seventy-seventh year of his age. According to tradition, shortly before his death he called for a mirror, arranged his hair neatly, and said to his attendants: 'Have I played my part well? If so, applaud me!' A. had consummate tact and address as a ruler and politician, and could keep his plans in secrecy while he made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by A. himself. He encouraged agriculture, patronised the arts and literature, and was himself an author; but only a few fragments of his writings have been preserved. Horace, Virgil, and all the most celebrated Latin poets and scholars, were his friends. His was the *Augustan Age* of literature. His death threw a shade of sorrow over the whole Roman world; the bereaved people erected temples and altars to his memory, and numbered him among the gods.

AUGUSTUS, Elector of Saxony (1553—1586), son of Duke Henry the Pious, and of Katherine of Mecklenburg, was born July 31, 1526, at Freiberg, then the seat of his father's court. While still a

youth, he spent some time at Prague, and there formed an intimate friendship with Maximilian, King Ferdinand's son, afterwards Emperor of Germany. In 1548 he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and of her domestic worth. After the death of his brother, Maurice, in 1553, A. succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant Church. Equally intolerant and inconsistent in his theology, A. first used his utmost influence in favour of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, however, it must be owned, to his honour, that, by his skillful internal administration, he raised his country far above the level of any other in Germany, introducing valuable reforms both in jurisprudence and finance, and giving a decided impetus to education, agriculture, manufactures, and commerce. He even wrote a book on the management of orchards and gardens, and commanded that every newly-married pair should, within the first year of their marriage, plant two fruit-trees. The Dresden Library owes its origin to him, as do also most of its galleries of art and science. His own favourite private pursuit was that of alchemy, in which the Electress Anna also took a part. In the January of 1586—the electress having died in the previous year—A. married a young princess of Anhalt, but died a month after, and was buried in the cathedral of Freiberg. He was succeeded by his son, Christian I.

AUGUSTUS II., FREDERICK, commonly called the Strong, Elector of Saxony and king of Poland, second son of the elector, John George III., and of the Danish princess, Anna Sophia, was born at Dresden in 1670. His extraordinary strength was developed by a careful physical education, and his mental faculties more successfully cultivated than his morals. From 1687 to 1689 he travelled over the greatest part of Europe, but was prohibited by his father from visiting Rome. Upon his father's death (1691), he went to Vienna, and there formed an intimacy with Joseph, king of Rome, which materially influenced his politics. When, in 1694, he succeeded to his brother George as Elector, instead of turning his arms against France, according to previous arrangement, he undertook the command of the Austro-Saxon army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than Prince Conti for the crown (10 million Polish florins), and adopting the Catholic faith, he was elected king by the venal nobles; and having, by his imposing force, awed the adherents of Conti, he was crowned at Cracow, 15th September, 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leszcynski, and the ignominious peace of Altranstädt in 1706. So complete was his humiliation, that A. was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on receiving intelligence of the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstädt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII. at Frederickshall, in 1718, gave a new aspect to affairs, leading first to

a truce, and eventually to a peace with Sweden. Meanwhile, a confederation, headed by a Polish nobleman, had been formed against the Saxons, and repulsed them with much success, till, in 1716, through the mediation of the czar, a compact was made between the Poles and A., agreeably to which the Saxon troops left the kingdom. The king now found himself obliged to employ conciliation, and the splendour of his dissolute court soon won the favour of the Polish nobles, who followed his example but too closely. Saxony had bitter cause to regret the union of the crowns. Its resources were shamefully squandered, even when want and famine were in the land, on the adornment of the capital, on the king's mistresses, his illegitimate children, and the alchemists who deluded him with hopes of the elixir of life. A. supported the fine arts as ministering to luxury, but did little for the cause of science. Despotic in principle, though easy in temper; ambitious as well as luxurious; reckless alike in the pursuit of war and pleasure, death overtook him in the midst of projected festivities. On his way to the Warsaw diet, gangrene of an old wound set in, and he died in February 1733, and was buried at Cracow. By his wife—a Protestant, and daughter of the Margrave of Brandenburg-Kulmbach—he left an only son, who succeeded to him. The most celebrated of his numerous illegitimate offspring—amounting, it is affirmed, to somewhere about 300—was Maurice, Count of Saxony.

AUGUSTUS III., FREDERICK, Elector of Saxony, and king of Poland, the son and successor of the above, was born in October 1696, and carefully educated by his mother in the Protestant faith. At the age of fifteen, however, he left her tutelage for a tour through Germany, France, and Italy, where he changed his religion, secretly professing Catholicism at Bologna, in 1712, though the fact was not publicly known in Saxony till five years later. It is possible that an eye to the crown of Poland, and to an alliance with one of the Austrian princesses, may have had something to do with this step. After succeeding his father in the electorate in 1733, he was chosen king of Poland by a part of the nobility; and triumphing over the rival claims of Stanislaus Leszcynski, supported by Louis XV., was unanimously proclaimed three years later. He inherited his father's sumptuous tastes, though not his talents; and his love of art, cultivated by his Italian tour, enriched the gallery of Dresden with noble paintings. The government of his country he made over entirely to his prime minister, Count von Bruhl, whose whole political system consisted in complete dependence upon Russia. In 1742, alarmed at the increased power Prussia had obtained by the conquest of Silesia, A. formed an alliance with Maria Theresa; and by the secret treaty of Leipsic, contracted to supply her with 50,000 men. But their united troops were completely routed by the Prussians in 1745; and Frederick II. pushing on into Saxony, A. had to escape from his capital, saving his art-treasures, but leaving his state-papers in the hands of the conqueror. In 1746, the peace of Dresden restored him Saxony; but the close of the year again saw him embroiled with Prussia. Joining the camp at Pirna, he narrowly escaped being taken prisoner, and had to flee to Poland, where his popularity, never very great, was much diminished by his recent reverses in Saxony, added to which the Empress Catharine of Russia used every effort to dislodge him, as being an ally of France. At the conclusion of the peace of Hubertsburg, A. returned to Dresden, where he died in 1763. His son, Frederick Christian, succeeded him in the electorate, and Stanislaus Poniatowski became king of Poland.

AUK (*Alca*), a genus of web-footed birds, the type of a family called *Alcedæ*, which was in great part included in the Linnæan genus *Alca*, and to many of the species of which, now ranked in other genera, the name A. is still popularly extended. The *Alcedæ* are amongst those web-footed birds collectively called *Brachypteres* (i. e., short-winged) or *Divers* by Cuvier, remarkable for the shortness of their

Great and Little Auks.

wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and compels them, when on land, to maintain an upright attitude. They are distinguished by the very compressed bill, which, in the true auks, is vertically elevated, and so sharp along the ridge as to resemble the blade of a knife; and by their entirely palmated feet, destitute of hind toes. The auks are entirely confined to the seas of the northern hemisphere—the penguins taking their place in the southern—and are most abundant in the colder regions. All of them have a dense plumage, which generally exhibits on its surface a beautifully polished appearance and silvery lustre. The genus *Alca*, as restricted by Cuvier and others, contains only two species, distinguished from the Puffins (q. v.), which also belong to this family, chiefly by the greater length of the bill, and its being covered with feathers as far as the nostrils. The bill, both in the auks and puffins, is transversely and strongly grooved. But even the two known species of the restricted genus *Alca* differ from one another in a most important particular—the wings of the one, the Great A., being so short that it is quite incapable of flight, like the penguins, of which it may be deemed the true northern representative, whilst the other, the Razor-bill, has comparatively long wings, and flies well.—The GREAT A. (*Alca impennis*) is as large as a goose. It is an inhabitant of the most northerly shores, and a very rare visitant of those of the Orkney and Shetland Islands and the Hebrides. It is almost equally rare in Norway and Sweden, and has nearly disappeared even from Iceland and Greenland, and from localities on the coasts of Labrador and Newfoundland, where it is said to have been formerly frequent. The rapidity with which this bird moves under water is extraordinary: one of them has been pursued by a six-oared boat for hours in vain. Like most of the *Alcedæ*, the Great A. lays only one egg, which is very large, about five inches in length, and three in its greatest

breadth. The egg is laid on the bare rock, without any attempt at a nest.—The RAZOR-BILL, (q. v.) (*A. Torda*) is the only other species now commonly included in the genus *Alca*.—The name LITTLE A. is often given to a bird also called the ROTCHE (q. v.), (*Merghus Alle*, formerly *Alca Alle*), common in arctic regions.—The common puffin is sometimes called the Labrador Auk.—The northern parts of the Pacific Ocean abound in auks remarkable for a somewhat quadrangular bill, notched near the tip, which form the genus *Phaleris*. One of them, *P. psittacula*, is known as the Parrakeet Auk.—All the auks feed upon fishes, crustaceans and other marine animals, which they pursue under water, and for which they dive to great depths.

AULIC COUNCIL, (Lat. *aula*, court or hall), one of the two highest courts of the old German empire, co-ordinate with the Imperial Chamber. It came into existence in 1495, and seems to have been at first employed principally in preparing business-matters regarding the crown-lands and the empire generally, in order to expedite the decisions of the Imperial Chamber. It soon, however, began to assume or acquire higher functions. After 1502, the States submitted important grievances to its independent consideration; but it did not receive a fixed constitution before 1559. In 1654, it was formally recognised as the second of the two supreme courts, and equal in dignity to the Imperial Chamber. It was composed of a president, a vice-president, a vice-chancellor, and eighteen councillors, who were all chosen and paid by the emperor, with the exception of the vice-chancellor, who was appointed by the Elector of Mainz. Of the eighteen councillors, six were Protestants, whose votes, when they were unanimous, could not be set aside by those of the others, so that a religious parity was to some extent preserved. The councillors were divided into three classes—counts, barons, and men of learning—all of whom were on a footing of equality, except that the last mentioned received a higher salary, and were usually advanced into the ranks of the nobility. The Council held aloof from politics, but under its jurisdiction were placed: 1st, All matters of feudality in which the emperor was immediately concerned; 2d, All questions of appeal on the part of the States from decisions in favour of the emperor in minor courts; 3, Whatever concerned the imperial jurisdiction in Italy. On the death of the emperor, the Council was dissolved, and had to be reconstructed by his successor. It finally ceased to exist on the extinction of the old German empire in 1806.

AUMALE, CHARLES DE LORRAINE, DUC D', born 1554, was an ardent partisan of the League in the politico-religious wars which devastated France in the latter half of the 16th c. The aim of the League was ostensibly to suppress the Huguenots, but in reality to secure the supreme power to the Guises. Closely allied by blood to this crafty and ambitious family, A. from the very first entered with fanatical sympathy into its schemes; and after the murder of the Duke of Guise at Blois in December 1588, he became, along with the Duke of Mayenne, the leader of the party. In 1589, he seized Paris, dissolved the parliament, and imprisoned its members. Shortly after, he put himself at the head of a body of troops to attack the town of Senlis, but was defeated by La Noue, and compelled to retreat. Always unfortunate in war, his presence seemed invariably to insure the overthrow of his friends. He commanded a portion of the forces of the League at the battles of Arques and Ivry, where the Huguenots triumphed under their skilful and sagacious monarch, Henry IV. But A. was as obstinate as he

was unlucky, and in the end proved himself as traitorous as he was obstinate. He held out for the League in Amiens until the populace expelled him, when he suddenly allied himself with the Spaniards who had invaded Picardy, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel. His property was confiscated, but he himself escaped. He lived in exile till his death, which took place at Brussels in 1831. He left no male posterity.

AUMALE, HENRI-EUGENE-PHILIPPE, LOUIS D'ORLÉANS, DUC D', born at Paris, January 16, 1822, is the fourth son of the late king of France, Louis Philippe. He enjoyed the privilege—so rare among princes—of being educated along with his fellow-men, at the college of Henri IV., where he exhibited considerable talent, and obtained several honours. When 16 years of age, he entered the army, soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. In 1843, he embarked at Brest for Algeria, where he commanded a subdivision of the French army, and performed some brilliant exploits, the most signal of which was his surprising Abd-el-Kader, when encamped in the environs of Goudjilab. By this *coup de main*, which occurred on the 16th of May 1843, there fell into his hands a multitude of cattle, 4 standards, 3600 prisoners, and the correspondence and treasure of the Emir. He was, in consequence, elevated to the rank of lieutenant-general, and appointed to the government of the province of Constantine. In 1847 he succeeded Marshal Bugeaud in the governor-generalship of Algeria. While holding this high office, he was exposed to a series of bitter attacks by the Democratic 'opposition' in the Chamber of Deputies, but was ably defended by Guizot. After the expulsion of his father, he withdrew from Algeria, having first, with self-denying patriotism, exhorted the colony peaceably to obey the orders of the metropolis. The duke now resides in England, and apparently takes no part in politics. He has written two remarkable articles in the *Revue des Deux Mondes*—one on the *Zouaves*, and another on the *Chasseurs-à-pied*. He has also composed a *Histoire des Condés*, and several other works.

AUNE, the French cloth-measure corresponding to the English *ell*. Both words are derived from the Lat. *ulna*. The English ell=1½ yard=45 inches; the French *aune usuelle* (or *nouvelle*)=1½ mètre=47½ inches English. The old *aune* was a little shorter.

AUROY, MARIE-CATHERINE-JUMELLE DE BERNEVILLE COMTESSE D', a celebrated French authoress of the reign of Louis XIV. She was born about 1650, and died at Paris, January 1705. She composed fairy tales, romances, and historical memoirs. Among her fairy tales may be mentioned, *The Yellow Dwarf*, *The White Cat*, and *Cherry and Fair Star*. Many of these fictions have been translated into English, and are greedily read by school-boys. They have, both in France and other countries, gone through numerous editions, and are the sole monuments of her fame; for her sentimental novels, *Hippolyte*, and *Comte de Douglas*, have long ago vanished from the eyes of men; while her historical memoirs are not regarded as in the slightest degree trustworthy.

AURANTIA'CEÆ (from *aurantium*, modern Latin for an orange), a natural order of exogenous plants, consisting of trees and shrubs, often of great beauty. Both leaves and bark are generally very smooth, and all parts are filled with little transparent receptacles of a fragrant volatile oil, which especially abounds in the leaves and in the rind of

the fruit. The leaves are alternate, and always articulated with their stalks, which are frequently winged. The flowers have a short, 3—5 toothed, withering calyx, and 3—5 petals, which are broad at the base, sometimes slightly coherent, and imbricated in bud. The stamens are equal in number to the petals, or a multiple of their number; the filaments sometimes slightly coherent in one or more bundles; the anthers terminal and erect. The stamens and petals are inserted on a disk. The ovary is free; there is one style with a thickish stigma. The fruit (a *hesperidium*) is pulpy, with a leathery or spongy rind, of one cell, or of a number of separable cells; the seeds attached to the axis, with thick cotyledons and no albumen, not unfrequently containing more embryos than one.—The order contains about one hundred known species, natives of warm climates, and almost all of the East Indies. The species of the genus *Citrus* (q. v.) are the best known, among which are the orange, lemon, citron, &c. But the order contains many other plants producing agreeable fruits, among which the *Ægle Marmelos* (see *ÆGLE*)—called Biel, or Bael, in India—*Cookia punctata* (the Wanpee), *Glycosmis citrifolia*, and *Triphasia trifoliata* deserve particular notice. The fruits, ripe and unripe, juice and rind, the flowers, leaves, bark, &c., of a number of species are employed medicinally. The medicinal uses of *Ægle Marmelos* have been already noticed in the article *ÆGLE*; those of the species of *Citrus* will be mentioned under their proper heads. The leaves of *Bergera Koenigii* are used by the Hindus as a stomachic and tonic, the bark and roots as stimulants.—*Feronia elephantum*, a large tree growing in most parts of India, yields a gum which closely resembles gum-arabic, and is used for similar purposes. The young leaves of this tree have a smell like that of anise, and are used by the native practitioners of India as a stomachic and carminative.—*Skimmia* (or *Limonia*) *Laureola* and *Skimmia Japonica* are remarkable exceptions in this order, as to the climate to which they are adapted: the former grows on the cold and lofty mountains of the north of India, braving frost and snow; the latter, a beautiful shrub, recently introduced into Britain from Japan, is perfectly hardy even in the severest winters; its evergreen leaves and pretty little red berries remaining quite uninjured by frost, whilst its small white flowers, produced early in summer, have the fragrance of orange blossoms.

AURELIA. See CHRYSALIS.

AURELIANUS, LUCIUS DOMITIUS—also named CLAUDIUS DOMITIUS and VALERIUS—one of the most powerful of the Roman emperors, was of very humble origin, his father having been a husbandman. He was born about A.D. 212, and enlisting early as a common soldier, he rapidly distinguished himself, and held the highest military offices under Valerianus and Claudius II. On the death of Claudius (A.D. 270), A. was elected emperor by the army. He commenced his reign by vigorous opposition to the barbarian Alemanni, or Marcomanni, whom he expelled. Thereafter, he commenced the erection of a new line of fortified walls round Rome, which were not completed till the reign of Probus (A.D. 276). Their ruins still mark the boundaries of Rome in the time of Aurelian. Finding that the province of Dacia (now Wallachia) could not be maintained against the assaults of the Goths, he surrendered it, on certain conditions, and strengthened the frontier of the Roman empire by making the Danube its boundary. He next turned his attention to the East, where the renowned queen, Zenobia (q. v.), had extended her sway from Syria to Asia Minor and Egypt. A. defeated her in

two battles, and besieged her in Palmyra, from which she attempted to escape, when she saw defence would prove unavailing. She was, however, taken prisoner, and soon after the city surrendered, and was treated leniently. Shortly after A. had departed, a new insurrection took place. He returned, in 273, and gave the splendid city up to destruction. A. was again called to the East by a rebellion in Egypt, instigated by Firmus, a merchant of great influence, which he speedily quelled. Besides, Tetricus, who had held imperial power in Gaul since before the death of Gallienus, finding himself unable to wield it, surrendered it to Aurelian. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, A. merited the title awarded to him by the senate—‘Restorer of the Roman Empire.’ He fell a victim to conspiracy during his campaign against the Persians (A.D. 276).

AURELIUS, MARCUS. See ANTONINUS.

AURICLES, two cavities of the heart. See HEART.

AURICULA (*Primula Auricula*), a plant of the same genus with the Primrose (q. v.), much cultivated in flower-gardens. The A. has long been a florist’s flower. It was highly esteemed by the Romans, and has, at least since the beginning of the 18th c., received particular attention from the florists of England and Holland. It is one of those flowers, the cultivation of which is often most successfully

Auricula (wild state).

prosecuted in the little gardens of operatives near large towns. Lancashire is particularly famous for it.—The A. has smooth, dark-green leaves, scapes (or leafless stems), and calices, covered with a mealy powder. A similar fine meal appears also on the flowers, and adds much to their beauty. The A. is a native of the Alps and other mountains of the middle and south of Europe, and of sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria; it grows in shady and moist places. In a wild state, it has comparatively small flowers, of a simple yellow colour, on short stalks, forming an umbel of generally six or seven on one scape, with the

same delightful fragrance which aids so much to make it a favourite flower in cultivation. The leaves are used by the inhabitants of the Alps as a remedy for coughs.

By cultivation and art, the *A.* has been brought to great beauty and splendour of colour. Red, pink, crimson, apple-green, and mulberry are the chief colours which the different varieties exhibit. More than 1200 varieties have been reckoned, and new ones are continually raised from seed. Some of them are entirely of one colour, others of two or more; some are delicately shaded, and some variegated. The mere colour of an *A.* is not of so much consequence, in the eye of a florist, as the form and shading. The chief requisites of a good *A.* are large flowers, so many of them on one scape as to give fulness to the umbel, the flower-stalks so strong that the flowers do not hang down; the scape itself must be so tall, that the umbel of flowers may rise completely above the leaves, and so strong as to bear it erect; the flower must be nearly round; the white or yellow eye in its centre must be distinct and round, its colour not mixing with the ground colour, which, however, may mix at the outer part with the green of the margin. The green margin adds much to the beauty of many varieties. The mealiness of the flower differs much in different varieties.—The *A.* blooms in April and May, and often also a second time in the end of autumn, which adds to the charms of the flower-border, although it is to the first or proper flowering-season that the florist looks. It succeeds best in a rich light soil, and cultivators diligently prepare for it composts of various kinds, but in general consisting chiefly of fresh loamy soil, and of well-rotted horse or cow dung, often with the addition of a little sand. The finer varieties are always cultivated in pots, and require great attention. They are protected from the severe weather of winter, and during the flowering-season, from wind and rain. They ought, however, previous to flowering, to stand in an airy, sunny situation. Their delicacy forms a striking contrast to the natural hardiness of the plant; but few sights are more pleasing than that of a collection of choice auriculas, tastefully arranged. They are propagated by offsets, generally in the latter part of August.—When it is proposed to raise the *A.* from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air, hand-glasses being placed over them during heavy rains. The seed is sown either in autumn or spring, generally in boxes placed under shelter, or in a slight hot-bed. The more weakly plants are tended with particular care, as they are generally found to produce the finest flowers.

The name *A.*, originally Latin, is derived from *auris*, an ear, on account of a fancied resemblance of the leaves to the ears of an animal.

AURICULA, a genus, and *AURICULIDÆ*, a family of Gastropod Mollusca. They have a spiral shell,

Auricula.

covered with a horny epidermis, the first whirl very large and the spire short, the aperture elongated and toothed. They belong to that section of Gastropods

in which the sexes are united in the individual, and to the same order with the common snails, having respiratory organs adapted for breathing in air, although some of them are capable of subsisting for a considerable time in water. Some of them inhabit fresh-water marshes, and others prefer the vicinity of salt water. They generally belong to warm climates, and some of them attain a large size. *Auricula Mida*, a native of the East Indies, is known to shell-collectors by the name of Mida's Ear.

AURICULAR CONFESSION. See *CONFESSION*.

AURICULATE, in Botany, a term applied to leaves, stipules, &c., and signifying that they have at the base two small ear-like lobes.

AURILLAC, a town of France, capital of the department of Cantal (Auvergne). *A.* is situated in a pleasant valley on the banks of the Jourdanne, about 269 miles south from Paris. It is said to owe its origin to a Benedictine monastery founded in the 9th c. by St. Gerard. The English, in the 14th and 15th centuries, often besieged the town, and it was frequently taken and pillaged during the religious wars in France in the 16th c. The streets are wide, but irregular, and are kept clean by streams supplied by a reservoir above the town and by a canal from the Jourdanne. The neighbouring quarries supply slates to cover the houses. The principal buildings of *A.* are the churches of Notre Dame and St. Gerard, St. Stephen's Castle, the theatre, college buildings, which contain a valuable public library, and the corn-market. There is also a monument erected to the memory of the French philanthropist, M. de Montyon. Paper, jewellery, lace, copper utensils, leather, and beer are the chief industrial products. Pope Sylvester II. was born at *A.*, and the infamous Carrier of the first French revolution. Pop. about 11,000.

AURO'RA (styled *Eōs* by the Greeks), the goddess of the dawn, or 'morning redness,' was the daughter of Hyperion and Theia, and sister of Helios and Selene, and wife of the Titan Astræus. Zephyrus, Boreas, Notus, Hesperus and the other stars were her children. She was described as rising in the morning from her bed in the ocean, borne along on a chariot drawn by the divine steeds Lampus and Phaëton, ascending heaven from the river Oceanus, where she lifted with her 'rosy fingers' the curtain of night, and announced the light both to gods and men. Homer frequently describes *A.* as the goddess of day, and the tragic writers identified *A.* with *Hemera* (the day). She was represented as clothed in a rosy-yellow robe, with a star shining on her forehead, and a torch in her right hand. She had a passion for mortal youths, and carried off Orion, Cleitus, and Tithonus.

AURO'RA BOREALIS, or *NORTHERN LIGHTS* (Ger. *Nordlicht*), the name given to the luminous phenomenon which is seen towards the north of the heavens by the inhabitants of the higher latitudes. During the winter of the northern hemisphere, the inhabitants of the arctic zone are without the light of the sun for months together, and their long dreary night is relieved by the light of this beautiful meteor, which occurs with great frequency in these regions. Those who have explored the southern seas have seen the same phenomenon in the direction of the south pole, so that the term Polar Lights might be more appropriate than Northern Lights to designate the aurora. The appearance of the *A. B.* has been described by a great variety of observers, both in Northern and Central Europe, all of whom give substantially the same account of the manner in which the phenomenon takes place. It is briefly as follows: A dingy aspect of the sky in the direction of the north is generally the precursor of

the aurora; and this gradually becomes darker in colour, and assumes the form of a circular segment surrounded by a luminous arch, and resting at each end on the horizon. This *dark segment*, as it is called, has the appearance of a thick cloud, and is frequently seen as such in the fading of twilight before the development of the auroral light. Its density must, however, be very small, as stars are sometimes seen shining brightly through it. This dark segment is bounded by a luminous *arch* of a blueish-white colour, which varies in breadth from 1 to 6 diameters of the moon, having the lower edge sharply defined, and the upper edge only when the breadth of the arch is small. This arch may be considered to be a part of a luminous ring elevated at a considerable distance above the earth's surface, and having its centre corresponding with some point near the north pole. An observer several degrees south of this auroral ring would see towards the north only a small arc of it, the larger part being hid by the earth; to one situated not so far south, it would appear as a larger and higher arch; to one placed

below it, it would be seen as an arch passing through the zenith; and to one situated within the ring and further north, it would be found as an arch culminating in the south. On this supposition, nearly all the various positions of the auroral arch may be accounted for. The centre of the ring corresponds probably with the magnetic north, which is at present situated in the island of Boothia Felix. Hence it is that in Greenland, which is situated to the east of this island, the auroral arch has been seen stretching from north to south with its highest point in the west. The luminous arch once formed, remains visible for several hours, and is in a constant state of motion. It rises and falls, extends towards the east and towards the west, and breaks sometimes in one part, sometimes in another. These motions become all the more observable when the arch is about to shoot forth *rays*; then it becomes luminous at one point, eats in upon the dark segment, and a ray of similar brightness to the arch mounts with the rapidity of lightning towards the zenith. The ray seldom keeps the same form for any length of time:

Aurora Borealis.

but undergoes continual changes, moving eastward and westward, and fluttering like a ribbon agitated by the wind. After some time, it gradually fades in brightness, and at last gives way to other rays. When the aurora attains its full brightness and activity, rays are projected from every part of the arch, and if they do not rise too high, it presents the appearance of a comb furnished with teeth. When the rays are very bright, they sometimes assume a green, sometimes a violet, a purple, or a rose colour, giving to the whole a variegated and brilliant effect. The accompanying sketch, taken from Müller's *Kosmische Physik*, of the A. B. in Norway, represents a beautiful aurora of this comb-shaped character; the effect of colour, however, is wanting to complete the picture. When the rays darted by the luminous arch are numerous and of great length, they culminate in a point which is situated in the prolongation of the dipping-needle, somewhat south-east of the zenith. There they form what is called the *Boreal Crown*; and the whole heavens, towards the east, west, and north, present

the appearance of a vast cupola of fire, supported by columns of variously coloured light. When the rays are darted less brilliantly, the crown first disappears, then, here and there, the light becomes faint and intermittent, till at last the whole phenomenon fades from the sky.

The preceding description indicates the general features of the appearance of the A. B.; but several auroras have been described which presented striking peculiarities. Sometimes the phenomenon assumed the form of one or more curtains of light, depending from dingy clouds, whose folds were agitated to and fro, as if by the wind. Sometimes this curtain seemed to consist of separate ribbons of light, arranged side by side in groups of different lengths, and attaining their greatest brilliancy at the lower edges. In this country the A. B. seldom occurs with the distinctness and brilliancy which attend it in northern latitudes, but the description just given portrays the type to which such appearances of the meteor more or less approximate.

The height of the aurora has been variously

estimated. The first observers were inclined to place the seat of it beyond the atmosphere; but this hypothesis is untenable, as the aurora does not seem to be affected by the rotation of the earth, but appears to be in every respect a terrestrial phenomenon. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, heights varying from 5 to 500 miles have been calculated. The cause of these widely differing results may be found in the probability that exists of each observer seeing a different arch of the aurora for himself, and he is, in consequence, furnished with no comparable or reliable data for his calculations. It is now, however, generally admitted, on what are considered to be sufficient grounds, that the A. B. occurs at various heights, and that it is seldom found beyond ninety miles above the surface of the earth. The distance of the stations at which the same aurora has been visible, indicates the enormous geographical extent, and likewise the great altitude which the phenomenon frequently attains. One aurora, for instance—that which occurred on the 3d of September 1839—was seen in the Isle of Skye by M. de Saussure; at Paris, by the astronomers of the Observatory; at Asti, in the Sardinian states, by M. Quetelet; at Newhaven, in Connecticut, by Mr. Herrick; and at New Orleans, by credible observers. On the other hand, some observers of eminence assert that the aurora sometimes descends to the region of the clouds, and appears almost as a local phenomenon. A brilliant aurora was seen by Mr. Farquharson, the minister of Alford, in Aberdeenshire, on the 20th of December, 1829, from eight to half-past eleven in the evening, above a thick bank of clouds, which covered the tops of the hills to the north of where he lived, and which never attained an altitude of more than 20°. The same aurora was seen in the zenith, at a quarter-past nine, by Mr. Paul, another minister, at Tullynessle, which is about two miles north of Alford, so that the height of it could not have been quite 4000 feet.

The noise that is alleged to accompany the A. B. in high latitudes would indicate for it a comparatively moderate height. Some of those who have heard it, compare it to the noise that is produced by the rolling of one piece of silk upon another; and others, to the sound of the wind blowing against the flame of a candle. In Siberia, it has been related that this noise sometimes resembles that attending the discharge of fireworks; and that the dogs of the hunters, when overtaken by such an aurora, lay themselves with terror on the ground.*

The intimate connection between the A. B. and the magnetism of the earth is shewn by various facts. During the occurrence of the phenomenon, the magnetic needle appears very much disturbed, sometimes deviating several degrees from its normal position, and appearing to be most affected when the aurora is brightest; and this oscillation is frequently perceived far beyond the district where the aurora is seen. The vertex, likewise of the luminous arch is almost always found to be in or very near the magnetic meridian, and the boreal crown has its seat in the prolongation of the freely suspended needle. There seems, moreover, to be a connection between the magnetic poles of the earth in regard to the aurora, for, so far as has been ascertained, the meteor occurs simultaneously at both. The origin of the A. B. is as yet a matter of conjecture. The most common hypothesis is, that it is an electrical

phenomenon; and this is borne out to some extent by the great resemblance which the light attending the passage of electricity through a nearly vacuum jar bears to the luminous appearance of the aurora. If one of the vacuum tubes lately invented by Mr. Gassiot be brought into the neighborhood of a powerful electrical machine, both while the machine is in motion and for some time after, flashes of light pass from the wire at the one end of the tube to that at the other extremity, which bear a striking resemblance to the auroral rays. If the conditions necessary for the production of the aurora be similar to those holding in this experiment, it must be caused by the electricity accumulated round the magnetic poles discharging itself through the rare strata of the higher atmosphere; but how such conditions (if actual) occur, is a question still in need of solution.

AURUNGABAD, or *Throne-town*, the name of at least four places in India. The most important is in the territory of the Nizam, situated on the Doodna, a tributary of the Godavery. Its lat. is 19° 51' N., and long. 75° 21' E. It is one of the stations of the Nizam's army. In 1825, its population was estimated at 60,000—a number supposed to have since then considerably diminished. Its monuments of former grandeur are a palace, built by Aurungzebe, and the mausoleum of Aurungzebe's daughter. The former is now in ruins; and the latter, though bearing some resemblance to the Taj Mahal of Agra, is greatly inferior.

AURUNGZEBE (properly, Aurangzib, 'Ornament of the Throne') was the most powerful of the Great Moguls, the last who ruled with energy and effect. He was born on the 22d October 1618, and was ten years old when, his grandfather dying, his father, Shah-Jehan, ascended the throne. A. early aspired to wield the rod of empire, but he craftily hid his designs beneath the cloak of piety. In

Aurangzebe.—From a Native Drawing

1657, his father, who had previously promoted him to high civil and military offices in the state, in performing the duties of which he greatly distinguished himself, was seized with an illness from which he was not expected to recover. The reins of power were at once seized by his eldest son, Dara, who treated his brothers very arbitrarily—Shujá at that time being governor of Bengal, A. of the Deccan, and Múrad of Guzerat. The first immediately took up arms. A.'s policy was to let the two fight it out, and exhaust each other, and then to play off his third brother against the victor. He conferred with Múrad; assured him he had no earthly ambition; that the crown he strived for was a spiritual,

* Arctic voyagers, such as Parry and Franklin, throw doubt on the existence of any such noise, for not one of the numerous and brilliant aurora seen by them was ever attended with the faintest sound.

and not a temporal one; and that, for affection's sake, and with a view to promote the interests of the true faith—Dára was liberal in his religious opinions, and had written a book to prove that Mohammed and Brahma agreed in all essential points—he would support his pretensions to the throne. Múrad believed him, and the forces of the two were joined. Meanwhile, Dára having overcome Shujá's army, directed his forces against his other two brothers; but A.'s plausibility prevailed over Dára's generals, who deserted, and Dára had to seek safety in flight. By this time, however, Shah-Jehan had somewhat recovered. A. professed the utmost loyalty, but secretly gave his son instructions to take possession of Shah-Jehan's palace, which was done, and the aged monarch was made prisoner. A. next seized and confined his too confiding brother, Múrad; and after a struggle of two or three years' duration, Dára and Shujá also fell into his power, and all three were put to death. The sceptre was now firmly within the grasp of Aurungzebe. He professed not to care for the imperial insignia, but was ultimately induced to receive them on August 2, 1678. He, at the same time, assumed the presumptuous title of Alengir, 'Conqueror of the World.' He also took the title of Mohi-eddin, 'the Reviver of Religion.' In the seventh year of A.'s reign, his father died, at a good old age; but there are suspicions, nevertheless, that his death was hastened by slow poison, administered by command of his son.

A.'s long reign of half a century was distinguished by great outward prosperity; but the empire was diseased at its heart. Everywhere there was distrust; A., who had established his empire by fraud, was naturally enough distrusted by all. He lacked confidence in his statesmen, who, in their turn, distrusted him and one another. His sons imitated him in his disobedience to his father, and the Hindus, whom he treated with great harshness, excited the Mahrattas against him in the south. Still his great abilities sufficed during his reign not only to preserve his empire intact, but even to enlarge it considerably. Discord between the monarchs of Bijapur and Golconda, which was mainly due to his policy when acting as governor of the Deccan, enabled him to add these two kingdoms to his empire. But the seeds of decay which had been sown in his reign bore ample fruit in the reign of his son. The decadence of the Mogul empire dates from A.'s death, which took place at Ahmednuggur, on the 21st February 1707, in the eighty-ninth year of his age, and fiftieth of his reign. The latter years of A.'s life were passed in misery. The memory of his own crimes weighed heavy on his soul. He lived in constant dread that he himself would receive of the measure which he had meted out to others. His court was remarkable among Oriental courts for its economy and freedom from ostentation. A.'s character was not without its good features, as instanced by the fact, that in the third year of his reign, when there was a great famine in the land, he gave unreservedly the funds of his treasury, which had been greatly augmented by his frugality, to procure food for his people.

AUSCULTATION (Lat. *ausculto*, to listen), a mode of detecting diseases, especially those of the heart and lungs, by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (*Immediate A.*), or by the aid of a simple sound-conveying instrument, the stethoscope (*q. v.*) (*Mediate A.*). By care and attention, the normal sounds produced by respiration and the beating of the heart may be distinguished from the several abnormal sounds indicating disease. A. is classed among the most important of discoveries in modern medical science. Its details are ably

explained by the discoverer, Laënnec. See **PERCUSSION**.

AUSONIUS, **DECIVS MAGNUS**, the most conspicuous Roman poet in the 4th c. after Christ, was born at Burdegala (Bordeaux), about 309 A. D. Scaliger asserts that his father, Julius A., was the favourite physician of the Emperor Valentinian, but the assertion has no historic basis, so far as we know. He was, however, a man of considerable importance, having been at one time honorary prefect of Illyricum, and he appears to have taken care that the young A. should receive an excellent education. Many amiable female relatives fostered, and probably flattered the talents of the boy. After finishing his curriculum at Toulouse, he returned to Bordeaux, where, after practising for a short time at the bar, he turned his attention to literature, and soon distinguished himself as a professor of oratory. Some years later, he was appointed by Valentinian tutor to his son Gratian; afterwards quæstor, and, by Gratian, prefect of Latium, and subsequently consul of Gaul (379 A. D.). On the death of Gratian, A. retired from public life to his estate at Bordeaux, where he occupied himself with literature and rural pursuits until the time of his death (392 A. D.). The question whether or not A. was a 'Christian,' has occasioned much controversy, and remains yet unsettled. His works include translations of Greek eclogues, a collection of 150 epigrams, epistles in verse and prose, 20 so-called idylls and other descriptive pieces, which, though admired in their day, are generally worthless, and bear all the marks of the corrupted taste prevalent in literature during his time. But though destitute of every true poetic quality, A. occasionally displays a certain neatness and grace of expression, which shew that, in a better era, he might have proved a greater poet. Besides these, he also wrote a panegyric on the Emperor Gratian, full of bombastic phrases and fulsome adulation. Editions of his writings have been given by Scaliger (Leyden, 1575), Tollius (Amsterdam, 1669–1671), and Souchay (Paris, 1730.)

AUSTEN, **JANE**, a novelist of deservedly high reputation. Her father was rector of Steventon, Hampshire, at which place his daughter was born, December 16, 1775. Mr. Austen, who was himself a gentleman of some literary attainments, bestowed on his daughter an education superior to that usually given to young ladies in her sphere of life in the end of last century. Jane was distinguished alike by good sense, sweetness of disposition, and personal attractions. Her novels, which are rather limited in subject, are remarkable for the truthfulness with which they portray the everyday life of the middle classes of England in her time, and for their delicate, yet withal distinct discrimination of the various shades and peculiarities of character. Sir Walter Scott said of her: 'That young lady had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with. The big bow-wow I can do myself like any one going; but the exquisite touch, which renders common-place things and characters interesting from the truth of the description and the sentiment, is denied to me.' Miss A.'s first four novels—*Sense and Sensibility*, *Pride and Prejudice*, *Mansfield Park*, and *Emma*—were published anonymously between 1811 and 1816. *Northanger Abbey* and *Persuasion* followed, with her name on the title-page, in 1818, after her death, which took place at Winchester, July 24, 1817.

AUSTEN, **WILLIAM**, an English metal-worker and designer of the 15th c., celebrated as the constructor of the famous tomb of Richard de

Beauchamp, Earl of Warwick, in St. Mary's Church, Warwickshire. Men of taste and judgment have not hesitated to put his works on an equality with those of Italian artists of the same period.

AUSTERLITZ, a small town in Moravia, about 12 miles east-south-east from the town of Brünn, stands on the Littawa, and has a population of 2400. A. has a handsome college; but it is celebrated chiefly as the place where Napoleon I., in December 1805, defeated the combined forces of Austria and Russia, under the command of their respective emperors. After the capitulation of Mack, at Ulm, October 17, Napoleon had marched on without opposition to Vienna, of which he took possession, November 11, 1805. The Russian and Austrian forces had retreated to Moravia, and Napoleon had fixed his head-quarters at Brünn. Towards this locality the troops of Alexander and Francis marched in five parallel columns to offer battle. The movements of the allies were ill-conducted, and evidently made without a due knowledge of the strength of the French army, which was concealed by the tactics of Napoleon. It amounted to about 80,000 men; while the allied armies numbered 84,000, of which 16,000 were cavalry. The battle commenced at seven, on the morning of December 2, and the Russian line was soon broken. The left wing of the allies suffered severely towards the close of the engagement, and endeavoured to save themselves by crossing a frozen lake; but Napoleon ordered his artillery to play upon the ice, which was broken up, and about 2000 perished in the water. According to Alison, the allies lost 20,000 in killed, wounded, and prisoners, and the French 12,000. Russian and French accounts make their respective losses smaller. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on the 26th of December, by the treaty of Presburg, which determined that Austria should surrender the Venetian territories, and also her possessions in Swabia and the Tyrol.

AUSTIN, the capital of Texas since 1844, and seat of justice of Travis co., is situated on the left bank of the Colorado, in lat. $30^{\circ} 15' N.$, lon. $97^{\circ} 47' W.$, at a distance of 200 miles from its mouth. In the season of high-water—that is, in the winter—A. is accessible to steamboats from the sea. Population in 1860, 3494.

AUSTRALASIA, a term etymologically equivalent to *Southern Asia*, but according to usage different. While *Southern Asia* vaguely means the lower regions of that continent, A. definitely indicates those large, or comparatively large, islands which, lying between the Malayan or Indian Archipelago and Polynesia Proper, are at once rounded off in collective position from the former, and distinguished in individual magnitude from the latter. The islands in question are chiefly Papua or New Guinea, Australia, Tasmania, New Zealand, New Caledonia, New Hebrides, New Ireland, and New Britain—all to be again noticed in their places. Though the name is not in general use, yet it seems necessary, to a satisfactory system of geographical classification. In its entire extent, A. cannot be much less than Europe.

AUSTRALIA, the south-west division of Australasia. By some, it is strictly defined to be an island—as, indeed, may either of the masses of land called the Old and the New Worlds—while by others it is loosely described as a continent. It is bounded on the W. by the Indian Ocean; on the N., by Torres Strait; on the E., by the Pacific; and on the S., by Bass's Strait. It extends in S. lat. from 10° to 39° , and in E. long. from 113° to 154° ; while its longest

dimensions, as incidentally noticed under the head of AMERICA, may be said to run respectively on a meridian and a parallel. The parallel in question is that of about 25° , nearly the mean lat. of A.; and the meridian is that of 142° or 143° , nearly the mean long. of Australasia—a meridian, too, which, when produced in either direction, seems to mark out both Tasmania and Papua as geological continuations of Australia. In English measure, the greatest breadth from north to south is upwards of 2000; and the greatest length from east to west nearly 2600 miles. Of the resulting rectangle of 5,200,000 square miles, A. comprises more than a half, perhaps four-sevenths, or, in all, about 2,582,000 square miles—half the area of South America, as the next larger continent, or ten times that of Borneo, as the next smaller island.

In the mutual relations of itself and the ocean—a point of vast importance to so large a mass of land—A. is decidedly inferior to every one of the grand divisions of the globe. It is not indented by the sea, as is North America on the east, or Asia on the east and south, or Europe on all sides but one. Again, as to navigable channels between the coast and the interior, A. is not to be compared even to Africa with its Nile and its Zambezi, its Niger and its Congo, its Gambia and its Senegal, and its many smaller arteries of communication besides.

Among the indentations of the coast, the Gulf of Carpentaria, on the north-east, the only one of considerable magnitude, does, it is true, penetrate inwards about 500 miles from Cape York on the east, and about 400 from Cape Arnhem on the west. But this opening, even if in itself more available, is practically of little value. It is entirely surrounded by tropical regions—regions adverse to colonisation, at least on the principle, now the only admissible one, of free labour. This fact has been established by experience; for a settlement in the kindred climate of Port Essington to the north-west was abandoned as hopeless after a trial of seven years. But the approach, such as it is, of this gulf towards the interior has prompted aspirations which, wild as they might seem elsewhere, are perhaps less extravagant than some of the sober realities of this marvellous land. Assuming the inland parts of A., like the surface of the Caspian or of the Dead Sea, to be considerably lower than the ocean-level, some have suggested that, by means of a cut through the southern shore of Carpentaria, the central desert might be converted into a great inland sea, connecting the comparatively fertile countries around, not only with each other, but also with the rest of the world. Perhaps all the other inlets put together are scarcely equal in size to the Gulf of Carpentaria alone; while, strictly speaking, most of them are rather mere bends in the coast-line than actual arms of the ocean. Of the secondary inlets, the two that cut deepest into the land are the Gulf of St. Vincent and Spencer Gulf, in the south. Of harbours, properly so called, there is a remarkable deficiency: and this deficiency is all the more important from the dangerous character of the reef-girt shores. As to fluvial communications between the coast and the interior, they can, with a single exception, hardly be said to exist at all. The interior and the coast are alike unfavourable to the production and maintenance of regular and permanent streams. The interior—comprising the whole mass within a border of not more than 100 miles in average width, and representing, in proportional size, the plate of a mirror with the scantiest possible breadth of frame round it—sends, as a general rule, hardly any tribute to the ocean. So far from possessing any reservoirs for the supply of rivers, its only large body of water,

the brackish pool or salt marsh, according to circumstances, of Lake Torrens (q. v.), is the landlocked receptacle of at least one of its principal streams. With the single exception of the Murray, and perhaps its southern affluents, even such inland water-courses as do conduct their surplus to the sea, lose each a large proportion of its volume through evaporation and absorption. With regard to the coast streams, again, the mountains, which from the dividing ridge, being, as already hinted, only about 100 miles from the sea, the streams are necessarily, from their shortness, of comparatively insignificant size. This is more peculiarly the case on the south—for the Murray, as flowing from the inner slope of the maritime ridge, is no exception to the general rule. To the west of the Glenelg, which empties itself into the Southern Ocean, between Capes Northumberland and Bridgewater, the coast yields not a single river worthy of the name; while the entire line between Streaky Bay and Cape Arid—a stretch of 10° of long. on the Great Australian Bight—pours, incredible as it may seem, not a single drop of fresh water into the Southern Ocean.

But the poverty of Australian hydrography is aggravated by the singularities of its peculiar rain-fall. An alternation of rainless and of rainy periods is pretty nearly the normal condition of Australian skies. The rivers undergo a similar alternation of drought and flood, the one state being, within certain limits, almost as destructive as the other. Even in these inequalities there is great irregularity. During the period of drought, a river presents a succession of phases—a scanty, though still regular stream; nearly stagnant ponds with a connecting thread of water between them; detached 'water-holes' in all the gradations of a constantly decreasing depth; moist pits that may yield their buried treasure to the spade; and, lastly, parched hollows where the labour of digging may be expended in vain. In the drought, for instance, from July 1838 to August 1839—during which 'not a drop of rain fell in Sydney'—even the Murray, generally described as the only permanent river of any magnitude in the country, dwindled away into a chain of pools; and a recent explorer in Western A. found on the bed of a large river—an *affluent*, if it may be so called, of the thoroughly broiled and baked Murchison—the indubitable footprints, then 3 years old, of preceding explorers. The flood, again, varies as widely, if not so definitely and gradually, as the drought. To select what may be regarded as an average instance from a list of the floods of the Hawkesbury in New South Wales: the torrent, at the end of July and beginning of August 1808, rose to a height of 86 feet, or fully 50 above the edge of the bank, destroying the uncut crops of the settlement, and sweeping away stacks of wheat and great quantities of stock of every description. No fewer than 57 such visitations appear to have been ascertained and recorded within the historical period of 70 years since 1788, being distributed in the respective numbers of 14, 11, 17, and 15, between spring, summer, autumn, and winter, and that without the exemption of any one of the twelve months of the year.

The rivers of the east coast—the Brisbane, Richmond, Clarence, Macleay, Hastings, Manning, Hunter, Hawkesbury, and Shoalhaven—are, in general, towards their mouths, tidal streams, flowing between high banks through a comparatively level region. Some of those of Victoria—such as the Glenelg—spring from a moist and undulating tract of country; while most of the others rise among the lofty ranges and snowy

peaks of the Australian Alps—the coldest section of the bordering mountains by reason both of their altitude and of their distance from the equator. They are subject to frequent freshets in winter, and are less eccentric than the other rivers of A. in general. To the west of the Glenelg, as stated above, rivers may be said almost to disappear. South A. possesses only a few inconsiderable streams, and a number of usually dry torrent-courses; and as to the Great Bight, still further to the west, more than 500 miles of the coast have been already characterised as utterly waterless. To the west, again, of Cape Arid, the coast presents only a few small lakes and inconsiderable water-courses, but nothing worthy of the name of river. On the west side of A., the Swan River is by far the largest of the water-courses. Generally speaking, the whole of them are fed almost solely by the winter rains, many of them, during the dry season, either disappearing through a great part of their course, or dwindling into a series of detached pools. Along the remainder of the west coast, no rivers worth notice have yet been discovered. Nor yet along the north-west have any been found, excepting a few small ones towards Cambridge Gulf. The rivers of this neighbourhood much resemble in character those of the opposite angle in the colony of Victoria. They rise at no very great distance from the sea. Near their sources they are mere torrents; but in the lowlands their generally slow currents wind through fertile plains and valleys, which are subject to sudden and terrific inundations. In North A. are several comparatively considerable rivers—the Victoria, the South Alligator, the Roper, and the Albert. They are wide streams, rising in the elevated region of the interior, and traversing a rugged country, which is often flooded. Lastly, along the north-east, the streams are distinguished by their length, a distinction which they owe to their being parallel with the coast. They are the Mitchell, Lynd, Burdekin, Mackenzie, Dawson, Fitzroy, Belyando, &c.; the whole of them, with the exception of the two last-named, having been discovered by Dr. Leichhardt. To pass from the rivers of the coast to those of the interior, we must confine ourselves to two of the latter—Barcoo or Victoria, and the Murray with its numerous tributaries. The upper part of the Barcoo was first discovered by Sir T. Mitchell, in a broken district, lying 300 or 400 miles from the east coast, and nearly on the Tropic of Capricorn. Its broad reaches might there have floated a steamer. Since then, it has been traced by Mr. Gregory through a solitary course into Lake Torrens, though, in point of fact, it is only from time to time that it actually has a surplus to pour into its receptacle. The system, again, of the Murray and its tributaries is vastly more complex. Rising on the west or inner slope of the Australian Alps, it flows to the west-north-west with a plentiful stream, which alone in the country, after the fashion of a tropical river, rises and falls regularly according to the season; and, though inaccessible to ships of any size from the sea, it has an internal navigation of about 2000 miles in length. On its left or southern side, it receives several considerable streams, such as the Ovens and the Goulburn. But it is on the right or northern side that the basin of the Murray is most peculiar. The principal affluents in this direction are the Murrumbidgee and the Darling. The Murrumbidgee, to which the Lachlan, only less 'mysterious' than the Darling, contributes such surplus as it from time to time may have, forms the chief strand of a complicated net-work of water-courses. The Darling, after it has received all its tributaries, pursues its lonely way for 600 miles,

sending off branch after branch to lose themselves in landlocked lagoons. Nor is its growth less curious than its lower channel. The whole of the interior drainage of the maritime ridge of New South Wales between lat. 25° and lat. 34°, a stretch of about 625 miles, converges into a vast basin of clay, on the 30th parallel, where the Balonne, Dumaresque, Gwydir, Namoi, Castlereagh, Macquarie, and Bogan, after spreading out in spacious marshes, and amid complicated junctions and bifurcations, unite such surpluses as absorption and evaporation may have left them to form the 'mysterious' Darling.

Such being the hydrography of A., the investigation of the interior, so far as it has hitherto advanced, has been conducted almost entirely by land. In 1844, Sturt penetrated to the centre of the country, between Spencer Gulf on the south, and the Gulf of Carpentaria on the north, meeting sterility and drought. In 1847, Leichhardt, encouraged by the success of his previous expedition from Sydney to Port Essington, started from Moreton Bay on the east, for Western A., following a sort of diagonal of nearly the greatest possible length; and, as was to be dreaded, he must have failed in his bold enterprise; for neither of himself nor of his companions has any intelligence ever been received. In 1856, Gregory, proceeding from the north-west, seems to have come upon Sturt's central desert, at a distance of 200 or 300 miles from the coast; and again, in 1858, the same traveller made his way across the country from the mouth of the Victoria to the head of Spencer Gulf.

Any detailed view of the climate, besides being equally difficult and unsatisfactory with respect to so vast an aggregate of latitudes and longitudes, has been rendered comparatively unnecessary by the incidental allusions to the subject in the preceding paragraphs. The following are tabular statements, extracted from local publications:

MEAN ANNUAL RAINFALL.

Locality.	Latitude.	Rainfall.
Brisbane, Queensland, lately } Moreton Bay, ... }	27° 1'	35·92 in.
Port Macquarie, New South } Wales, ... }	31° 25'	70·79 "
Sydney, New South Wales, } Port Phillip, Victoria Colony, }	33° 51'	49·00 "
Lake Alexandrina, Mouth of } the Murray, ... }	38° 18'	29·16 "
Adelaide, South Australia, }	35°	17·45 "
York, West Australia, . . }	34° 55'	19·90 "
	31° 53'	25·39 "

The mean temperature of Melbourne is 59°, being about 9° higher than that of London. The warmest month is January, the mean of which is 68; the coldest is July, 49·34. The corresponding temperatures of London are 63° and 36°.

Geology.—The little that is yet known of the geology of A. has been chiefly obtained from occasional notes scattered through the journals of scientific travellers. So utterly unknown were the mineral treasures of this continent, that it was only comparatively lately, and by the merest accident, that the Burra Burra copper-mines were discovered. In 1851, farmers were turning up with the plough the auriferous alluvium; pebbles of gold-bearing quartz were used for garden-walks; and we have heard of an Oxford graduate who ornamented his garden-walls by building into them masses of white quartz variegated with portions of the unrecognised yellow metal. In 1846, when Count Strelecki submitted to Sir R. Murchison a series of rock and mineral specimens gathered in Southern A., the practised eye of that veteran in geology recognised in them a remarkable resemblance to the rocks in the auriferous districts of the Ural Mountains, which he had thoroughly explored. He could not ascertain that gold had ever been found in the colony, but so certain was he that the precious metal existed, that he printed and circulated amongst the miners of Cornwall a paper urging them to emigrate to New South Wales, and seek there for gold, as they had been accustomed to seek for tin and zinc among the alluvial débris of their own hills. After a few years, in the researches of Mr. Hargreaves, and the diggings that followed, this remarkable prediction was fulfilled to an extent that could not have been anticipated. This narrative is of much value, as shewing that geology is no longer in the hands of empirics; that its truths have been so gathered and arranged as to afford bases for safe inductions; and that, when rightly used, this science is of the first importance, even when tested by the utilitarian *Cui bono?* of the age. Recognising this, the colonial governments of A. have appointed state geologists, who have begun their examination of the Australian continent, and a few reports on circumscribed districts have been published.

In looking at the continent as a whole, it will require not many broad touches to convey all that is at present known. An immense, roughly quadrangular and comparatively flat district in Central A., extending from the southern shores in lat. 33° S., where it forms a coast-line of somewhat bold cliffs, to 18° S. lat., and having for its eastern and western limits 124° and 138° E. long., is composed of *Tertiary* rocks. The superficial characteristics of this vast almost unpeopled tract have already been described. Nothing more is known regarding its structure. Three other patches of Tertiary rocks exist. The largest is a broadish tract, which forms the coast of Western A. northwards from the colony of Perth, as far as the Tropic of Capricorn. The second occupies a considerable portion of the valley of the Murray River, in that district known as Lower Darling. The last and smallest patch covers the southern slopes of the Australian Alps, extending along the shore from Wilson's Promontory to Cape Howe.

The immense central expanse of Tertiary beds is surrounded by a continuous belt of *Plutonic* and *Metamorphic* rocks, only broken on the southern shores, where it forms the coast-line, and where the sea has indented it, forming a bay which has for its boundaries the more enduring primitive rocks. The crystalline belt is, on its east, north, and western sides, separated from the sea by a tract of land having a nearly equal breadth of 100 miles throughout its course. Tracing this from its southern termination in Western A., we find a limited region of palæozoic rocks occupying the colonised district around Perth, and containing valuable coal-beds. Northwards, as already indicated, the coast-line consists of Tertiary rocks. From their termination

in lat. 23° S., the rocks along the whole western and northern shores are composed of Secondary strata. On the eastern shore from Cape York to the western boundary of Victoria, the formations belong to one or other of the primary series. Through the whole extent of this boundary tract, whether consisting of Tertiary, Secondary, or Primary strata, numerous and often extensive patches of igneous rocks exist which have been erupted during the Tertiary or Post-tertiary epochs.

About 100 miles from the bounding tract of paleozoic rocks on the eastern limits of A., and running parallel with it, there is an equally broad strip of similar strata extending from the shores of the Gulf of Carpentaria to Bass's Strait. These two regions, which unite together, and are largely developed in the southern portion of Victoria, supply the great store of Australian mineral wealth. The veins which intersect these strata were the original matrices of the gold. It has not, to any extent, been sought for in this, its original position, from a belief that the amount of metal decreases as we descend in the solid rock. Mr. Selwyn, colonial geologist for Victoria, has, however, lately reported in favour of quarrying for the gold in the solid rock. The greatest amount of gold is found in the heaps of debris or old alluvium derived from the denudation of the old slaty rocks. The auriferous rocks of Eastern A. are Lower Silurian, as shewn by Messrs. Lonsdale and Salter, from the examination of specimens of pentameri, trilobites, and corals from the strata which overlie them. Mr. Selwyn has referred the Victoria gold-bearing strata to the same age, from the occurrence in them of about 60 species of Lower Silurian fossils, including trilobites, graptolites and lingule. The auriferous quartzose veins are most abundant in the vicinity of eruptive rocks, whether granite, porphyry, or greenstone.
